CHAPTER I.—THE FRENCHWOMAN.

'LAWRENCE,' said the bigger man of the two—a huge, careless figure, with black hair, daring eyes, and complexion dusky red—'Lawrence, Madame Thiebault is as sweet a woman as ever came across the Channel. Her eyes would bewilder a saint, and her wit is as bright as her eyes. But, after all, we English folk want in our wives something a little safer and less dazzling. There is a mystery about her, and we don't like mysteries in the family circle. Where does she come from? Who was the late M. Thiebault? And that solemn-faced major-domo of hers is as much a problem as his mistress.'

'I am old enough,' answered Lawrence a little grimly, 'not to make a fool of myself.'

'Ah,' said the big man, his eyes rolling with a sort of quizzical kindness on his companion, 'all the frosty hairs of Methuselah won't save even a wise man from making a fool of himself where a woman as pretty as Madame Thiebault is concerned. Marriage,' he went on in the tone of a philosopher discussing some abstract problem—'marriage at best is a gamble. Not that I, of all men, should object to it on that ground,' he added with an odd gleam of half-rueful humour. 'But in a game with such stakes we ought at least to know the cards. And what do you really know about this Frenchwoman? Why is she so friendly with those young fellows from the French ambassador's house?'

'I have got common-sense enough to take care of myself,' replied Lawrence. But he found his big companion's questions both inconvenient and exasperating, and his cheeks flushed under his black eyebrows.

'Yes,' said the elder man relentlessly; 'but common-sense loses its authority where a lady with Madame Thiebault's dazzling eyes is concerned. Why, they would melt that solemn icicle Pitt himself;' and the huge figure of the speaker shook with laughter. 'But,' he added with a sudden touch of gravity, 'those soft eyes can look as hard as steel on occasion.'

The pair had come out of one of the most famous and dangerous of London clubs. The big man was Fox, the kindest heart, the shrewdest brain, the most reckless gambler in England. He could be wise for anybody but himself. Lawrence, his friend, a wealthy London banker, to Fox's half-amused concern had fallen a sudden victim to the charms of Madame Thiebault, a Frenchwoman of uncertain antecedents, who somehow had got a footing in London society. Lawrence was no heavy-witted London 'cit.' The keen eyes which looked out from beneath his strong black brows showed he was a man of exceptional force. His wealth was great. A branch of his business was established in Paris, and his name carried weight in the financial circles of every Continental capital. From Paris he had caught something of its easy morals; something, too, of its daring politics. He belonged in public affairs to Fox's school, and a warm sympathy bound the two masterful natures together.

Lawrence was a widower with one boy, a sturdy eight-year-old lad, with the honest eyes of his dead mother. Fox's glance, for all his aspect of lazy unconcern, was curiously alert and observant. His friend was falling into the power of the too dangerous Frenchwoman. Himself a keen politician, he yet disliked political women, and this was one reason, amongst others, why he thought the Frenchwoman dangerous.

'Why,' he demanded of his friend, 'should she care for politics, or at least for politicians, so much? She turns old Lord G—— round her dainty little fingers. She will be at his grand party to-night; and Lawrence, old fellow, in spite of my warnings, you will be there too. You know that at bottom

[*All Rights Reserved.*]

you are a sober-blooded Englishman. When you marry again you will want a domestic fireside, and a wife to stay there contentedly with you. Now, Madame Thiebault is a comet; and you cannot sit by the domestic hearth in company with a comet;' and once more the big man shook with easy laughter.

'Lawrence,' he concluded. 'I have expended more sober sense on you in twenty minutes than I have spent on myself in twenty years, and it will all be wasted;' and, with a good-humoured nod, the big man—the cleverest, yet the most reckless figure in the three kingdoms—turned away from his friend. After taking a few steps, however, he turned back. 'I know human nature. Youth can trifle with love, but a man of your years can't. The climax will be sudden either way. It will be a sudden breach or a sudden marriage. You can't have a suicide, you know, in three acts;' and Fox went off with fresh laughter, leaving his exasperated companion without the power to reply.

As John Lawrence sat an hour later in Madame Thiebault's pretty drawing-room he tried to look at her through the lens of Fox's undazzled eyes. But the effort was vain. The gay smile, the level brows, the deep intoxicating eyes, the quick and daring wit of Madame Thiebault carried him away. On a footstool beside her sat her child, an angel-faced girl of four or five, and the child, Lawrence felt—in some dim, illogical way—served to accredit the mother. It gave her in her lover's eyes a touch of gracious womanliness. It even seemed to put round her life a halo of innocence. And Fox was right; at bottom Lawrence had the stubborn domestic instinct natural to his English blood, and the unconscious child seemed to give to that instinct a reassuring pledge. There awoke in him an impulse of protecting tenderness, a touch of unselfish feeling, that mingled with the passion the mother's face kindled, and seemed to purify it.

As he sat there and looked at the two, black-browed John Lawrence, known and feared for his daring speculations and ruthless temper all over financial Europe, surrendered to the spell. The glance of Madame Thiebault's eyes ran through his blood like strong wine. His nerves thrilled to the cadences of her voice. Her keen and nimble wit played round his slower, if stronger, brain, as he half-ruefully confessed to himself, 'like a swallow round a slow-winged crow.'

Now, when a rich widower of forty finds himself, to his own amazement, in love once more, strange things are possible. His youth seems to come back to him suddenly, and with almost intoxicating force. The strange, rich, half-forgotten ferment stirring in his blood frightens while it delights him. He is very apt to come to some dramatic, if half-ashamed, decision.

A month later he sat in the drawing-room of his brother, a hard-headed lawyer, as dry and as unsentimental as his own wig. He too, like Fox—but with less tact—was trying to warn his brother against the too fascinating French widow.

'Robert,' said John Lawrence to him at last, with a stubborn compression of his lips, 'let Madame Thiebault alone.'

Robert's wife, whose heart was jealous for his little motherless boy, just then in her charge, clung with feminine vehemence to the subject.

'You are too much at that Frenchwoman's house, John,' she cried. 'People are linking your names together.'

John looked at her sternly. 'Not another word,' he said, 'or we quarrel. Madame Thiebault is my wife.'

'Oh John,' cried his sister-in-law with apparent irrelevance, 'your poor little boy!' and the eyes of Mrs Robert Lawrence shone with mingled pity and anger.

Yes, John Lawrence had stopped all remonstrances, if he had not silenced all criticisms, by a sudden and private marriage with Madame Thiebault.

CHAPTER II.—THE WILL.

THIS is in no sense a chronicle of John Lawrence the elder, and he may be dismissed from the narrative very briefly. A mystery, it was admitted by everybody, lay about Madame Thiebault; and marriage, even for her husband, did not dissipate the mystery. The marriage became public, and his wife took her place in his sober London house as its mistress, and filled it with a feverish gaiety—Lawrence's City friends called it 'dissipation'—that smacked rather of Paris than of London. Her soft-footed major-domo took charge of the household. Old servants went, old habits were changed, strange guests crowded its stairways and ballroom; and its master, somehow, found himself, he grimly realised, a stranger under his own roof.

But at the end of two dazzling years the great house was suddenly shut up. It was announced that Mrs Lawrence had gone to Paris; and rumour said she had set up a house as gay, or even gayer, there; for her rich husband's money made all things possible. John's face wore an aspect so stern that it silenced all curious questions, but it could not prevent malicious speculations.

'He has found out,' said his shrewd brother, 'that Madame Thiebault'—under that roof she was never called Mrs Lawrence—'was nothing better than a secret agent for the French Government.'

'He has found out,' cried Robert's wife, with a touch of more feminine malice, 'that there never was any M. Thiebault.'

Plainly, something tragical had taken place. Lawrence had discovered some stain in his wife's record or some flaw in her character that pricked

his honour, and love was slain in the heart of the proud Englishman.

A month later, however, Lawrence himself went to Paris. 'Urgent business,' he briefly explained to his brother, took him there.

'That Frenchwoman will capture him again,' said Robert's wife. 'You men,' she assured her husband, 'are all such simpletons where a pretty woman is concerned.'

Then, after a brief interval, came the news that John Lawrence was dying, and his brother was summoned in haste to his bedside.

The news from Paris was true. Some wave of fever-tainted air from the sewers of Paris had crept into the strong Englishman's blood as he drove in the diligence through its streets. The fever ran its deadly course so swiftly that the head of his Paris house, in alarm, insisted on sending for the doctor from the English Embassy. Dr Graham did his best for the great London banker, the friend of Fox. But the sick man seemed to have no resisting power; hardly any wish, indeed, to live. His wife was the most light-handed of nurses, and flitted round her husband's bed with madonna-like face and air of angelic patience. But her husband's brow grew dark as she bent over him. Jacques, her inscrutable major-domo, wore a countenance more mysterious than ever.

'Doctor,' whispered the sick man one afternoon, 'I must make a new will. It need only be a dozen lines, and I want you to write it out for me.'

A Scotchman is always half a lawyer, and takes kindly to legal tasks, and Dr Graham readily seized pen and paper, and took down the words as the sick man slowly dictated them. The will was brief. It gave a hundred pounds a year to madame, five thousand pounds to her little girl Denise, and the whole remaining estate to his boy John, with Robert Lawrence as sole executor. Dr Graham was a plain-spoken Scotchman, and madame, with her bright eyes, her soft-handed quickness as a nurse, and the resigned look as of an early Christian martyr on her face, had won his heart.

'Is that will quite fair to your wife?' he asked bluntly.

The sick man's face darkened at the question. He seemed about to speak, but checked the impulse.

'Do not sign it now,' Dr Graham went on. 'Think over it. The will should be in duplicate,' he added, with an amateur lawyer's love for unnecessary precautions. 'Let Jacques make clean copies of it. I will come to-morrow morning, and then, if you still wish, it can be signed.'

That night Dr Graham wrote to Robert Lawrence. 'Your brother is ill,' the letter ran, 'and is worse than he knows. He has drafted a will which I have told him is unfair to his wife. You had better come over. I leave for India almost at once, and your brother should have one of his own blood at his side.'

The next day Dr Graham found his patient worse, but obstinately bent on completing his will. He was plainly, indeed, adding a new flame to the fever in his blood by fretting over the business. Jacques was summoned. He brought the paper he had prepared, opened it, and in obedience to a whisper from the sick man began to read it. Then a gesture from the sick-bed stopped him.

'Do you read it, doctor,' said Lawrence, as if some strange and sudden suspicion seized him.

A deeper shadow crept over the dark face of the major-domo, and he drew back the hand that held the will; but after a moment's hesitation he gave the paper to the doctor, who read it aloud. The sick man was propped up with pillows; the pen shook so much in his trembling fingers as he leaned forward to sign that the ink fell from it in a broad splash on the will. But with an effort Lawrence steadied himself and scrawled his signature. Then a spasm of pain seized him; his face went deathly white. Dr Graham was watching him keenly; he caught the paper as it fell from his fingers, thrust it into the major-domo's hands, and bent all his energies to the care of the sick man.

The attack slowly passed away. 'Have you witnessed the will, doctor?' the patient whispered presently. Jacques was summoned again, and after some delay came into the room with the document. Its condition showed that as the doctor caught the will from the sick man's hand his thumb had touched the wet blot of ink. He was a man of neat habits, and he looked ruefully at the black smear on the white paper.

'I have spoiled it,' he said hesitatingly, 'but there is no time, I suppose, to prepare a new one.'

'Sign it,' whispered the sick man impatiently. Dr Graham wrote his signature; Jacques signed as the second witness.

'Doctor,' whispered Lawrence, pointing to the will, 'put that in an envelope. Now seal it and endorse it. Keep it in the safe at the Embassy till you put it in my brother's hands.'

'Where is the duplicate?' Dr Graham asked Jacques.

'It is of no use,' answered the major-domo. 'Shall I not destroy it?'

'No. Give it to me.'

With a certain odd hesitation the major-domo handed him the sheet, and the doctor put it, with Scottish prudence, in the breast-pocket of his coat.

'If the sick man grows stronger he may still wish his will to be in duplicate,' he explained, 'and so the copy is worth preserving.'

When Robert Lawrence arrived his brother was unconscious. Dr Graham declared he could do no more for the dying man, and he was impatient to start. 'My ship,' he said, 'sails for India in a week, and I must start for England.'

He told the story of the will, and, going with Robert Lawrence to the Embassy, put the document into his hands. Robert Lawrence examined the envelope with a lawyer's care.

'When you read it,' said Dr Graham, 'you will see that it is not a very fair will. But Mr Lawrence was perfectly conscious when he signed it, and it is what he meant it to be.'

The next day Graham left Paris; two days afterwards John Lawrence died. He recovered consciousness for a few moments. The black mists of death seemed to lift, and a light came to his eyes as he saw his brother's face bending over him.

'Take care of Jack,' he whispered.

When the funeral was over, the will was opened and read; the widow sat with pensive and martyr-like face listening to the brief sentences. The figures were as Lawrence had dictated to Dr Graham, but the names were strangely shifted. Denise still had her five thousand pounds; to the dead man's boy an annuity of one hundred pounds was left; the whole of the great estate went to the widow, and she was made sole executrix.

'Graham said the will was unfair to the wife,' reflected the puzzled lawyer; 'but he must have meant the boy. It's the boy who is robbed. That Frenchwoman,' he added, with an expletive, 'has beaten us after all. Poor little beggar!' he went on, as he looked meditatively at the little, desolate figure of the lad, now motherless and fatherless; 'and he is at the mercy of that woman and her major-domo.' He would have carried him off to London, but the step-mother was the boy's legal guardian, and, it was plain, held keenly to her rights. Women, however, are not legally-minded; and Robert Lawrence knew that this circumstance would be held by his wife to be a quite inadequate reason for leaving the little fellow to the mercy of 'that Frenchwoman.'

The business of administering the English estate was slow, and Robert Lawrence did nothing to facilitate the process. He interposed, indeed, as many delays as possible. His wife vehemently urged him to dispute the will on the ground of undue influence, or any other ground he pleased. Any plea, in her indignant eyes, was good enough for objecting to a will which not only robbed the little orphaned lad, but left him in the hands of the guilty step-mother who had robbed him. 'An English judge,' said the angry lady, 'would not be worth his own wig who gave effect to a will so wicked.' The assets in Paris were of a more easily liquefied sort, and Madame Laurente, as she now called herself, readily got possession of them.

Presently the Lawrences in London learned that the boy had been sent to the royal military college at Brienne, one of several recently founded. The military schools at Paris and La Flèche were notoriously lax. The new schools were to be of a sterner sort, and to secure that end were put under monkish rule. That at Brienne was controlled by the Order of St Benedict. It was a school of one hundred and twenty pupils, half of them free, on the nomination of the king; the remainder paid a modest amount per year. The rule was that they entered at ten years of age, and on production of a certificate of birth. Young Lawrence was over that age; his name and birth were English; but money in the Paris of that day could work miracles. 'John Lawrence' was changed into 'Jean Laurente;' and thus disguised under a French label, the son of the dead English banker wore the uniform and lived the life of a cadet at the most famous of French military schools.

(To be continued.)

COLOURED PRECIOUS STONES.

By R. Burnett.

FROM time immemorial certain stones have been held in high esteem both for their value and appearance. Various kinds are frequently mentioned in Scripture—sufficient guarantee to Scotchmen of their importance; and in Eastern countries down to comparatively recent years potentates have found in precious stones the most convenient investment for their wealth. The diamond, the emerald, the ruby, the sapphire, have always been, as they are now, greatly prized and well known in jewellery of all kinds; but the high prices set upon most of these stones have kept them as comparatively rare possessions among all except the wealthier classes.

Within the last few years, however—even during the past year—a great development has taken place in the use of coloured semi-precious stones in decorative jewellery, and when tastefully applied such stones can be made very effective and artistic. Those who look occasionally at the jewellers' windows—and what lady does not?—must have observed the much greater variety of colours now employed, especially in the smaller sizes of semi-precious stones. This development is much more strikingly seen at popular Continental watering-places than in our own country; but the fashion here is only a little behind that of these gayer centres where moneyed people 'most do congregate.' At such places as St Moritz, Lucerne, Milan, Nice, Monte Carlo, Mentone, Trouville—to name only a few within the recent experience of the writer—jewellers display such treasures usually in the form of loose stones, which, especially to those who have made some study of the subject, is much more in-

teresting and tempting than when the stones are mounted as jewellery. Only in this form can one really become 'acquainted' with the stones and recognise their full beauty and good points, to borrow a phrase from the stud-book. To many there is a fascination in selecting suitable stones and having them made up to their own or to other exclusive designs. Several of the London shops, and even those in provincial towns, are now following the fashion of the famous *maisons* in the Rue de la Paix and Rue de Rivoli in Paris, the great centres of jewellers in that city of art and fashion, and displaying their pretty stones loose in the windows; although it may never be so common here as in the places mentioned to see on signboards, 'Grand Fabrique d'Écaille, Corail, et Bijouterie.'

Among the coloured stones that have rapidly come to the front, perhaps olivine takes the most prominent place. This is a stone of the same class as peridot, which will be referred to later on, but of a deeper green, even exceeding the emerald in the greenness of its green. In consequence of its somewhat 'strong' colour it is most effective when used in comparatively small sizes; but along with certain stones of, say, pink or rose-colour it can be introduced with highly artistic effect. Even fairly large stones of one, two, or more carats weight may be effectively set with a 'surround' of small diamonds—'brilliants' the jewellers would call them—so as to make a pretty ring or pendant. They have nearly as much beauty and effect as emeralds, and would perhaps be less than one-twentieth of the price; that is to say, olivine may be bought at from twenty shillings to thirty shillings per carat, whereas emerald would more probably cost from twenty pounds to perhaps fifty pounds. In all precious or semi-precious stones, colour, brilliancy, and hardness are the essential qualities, and olivine possesses all these in a fairly marked degree.

Another stone which, though long known to jewellers, has recently made very rapid advance in popular taste is the tourmaline, a stone of so wide classification that dealers are apt to call every stone unknown to themselves a tourmaline. Notwithstanding this indefiniteness, the stone is very highly prized for its hardness, brilliancy (or 'fire,' as this quality is technically called), and more especially for its variety of colour. Gray, brown, black, green, and pink are all included, but only the last two are of great value. The greens, however, range from soft moss-green to a deep blue-green, and the pinks from apple-jelly colour to a rich carmine; those of a soft rose-colour—other qualities being equal—having the most value. Like the emerald, these stones are very seldom found without some flaws, either 'shivers' or milky frothiness; but skilful setting can usually hide most of these defects. As a French dealer recently said to the writer in his own idiom, 'It is for their colour they are pretty.' Tourmalines can consequently be used in many ways, such as for ear-rings when cut in the form of brilliants, brooches, or pendants, either in the rose or green shades. Their price runs from about twenty-five shillings to fifty shillings or more per carat; and a stone of about five carats would make a suitable brooch, one of seven to ten a nice size for a pendant. Smaller stones, especially pear-shaped drops, are used very effectively in many ornaments.

Although a very old stone, which was in early times highly valued, the peridot is now much more used than in recent years. The finest qualities are of a yellowish-green colour with considerable lustre, and susceptible of a very high polish; but the commoner kinds are of an olive or leek green, without much sparkle, and are almost invariably 'step cut' so as to bring out their colour rather than their brilliancy. Their chief defect is want of hardness to stand a great deal of wear; but of course they can be repolished at comparatively small expense, and are then as good as new. Their price is considerably lower than that of tourmaline, and may range anywhere from fifteen shillings to thirty shillings a carat. As movement does not, except in the finer qualities, increase their brilliancy, they are best suited for brooches or any fixed ornament; still, they are often used in pendants.

Another very pretty stone, not so common in cold countries such as our own, probably in some respects prettier than any yet mentioned, is the aquamarine. As the name denotes, its colours have all a tint of the sea in them, and range from a whitish blue, or light sky-blue with a tinge of green, to a pretty sea-green. The better class of stones are highly limpid, with a vitreous (glassy) lustre and a delicate, elusive colour. They are specially hard, with much sparkle or 'fire,' which is equally well maintained in artificial light. Though quite suitable for a brooch, this stone is best adapted for pendants or drops to pendants, where the movements keep up a constant play of 'fire' from the stone, making them extremely effective as an ornament. The prices are much the same as those of the tourmaline, although with all precious stones exceptional qualities command almost any price asked.

Many other varieties of coloured stones are now being pressed into the service of the 'art jeweller,' several of them no doubt being but revivals from former times; for even we in the twentieth century have to admit that there are few new things under the sun. Among the more valuable and pretty of these varieties are the chrysoprase, with its many shades of beautiful apple-green colour, its transparency, and capability of high polish; the spinel, with its ruby-red and beautiful reflection of yellow colours; the zircon, with its adamantine lustre and great transparency; and the fire-opal or Mexican opal, with its deep-orange or 'flame' colour—a little of which goes a long way, but which in small sizes can be used by jewellers with considerable effect. Amethysts and topazes of the cheaper kinds

have not been referred to, simply because there is little value in the stones themselves. The expense is merely in the labour of cutting them, and that is usually done by machinery and in hundreds at a time, otherwise how could 'real stone' brooches of these stones be sold at from, say, two shillings and sixpence upwards?

As practical illustrations of how to get away from the hackneyed types in jewellery, take, for example, the ordinary yellow topaz—frequently in Scotland called 'cairngorm,' although perhaps not one in a thousand of these stones ever saw the Cairngorm Hills. This well-known form of brooch, with its usual 'surround' of pearls, is so conventional as to be commonplace. Let, however, a lady select a nice stone of a size and colour to suit her fancy—the cost would be about one pound—and let her have it made up with a 'surround' of light filigree-work or art gold-work in dull gold—say another pound—and compare the effects. It is no disparagement to pearls, which always tend to give a soft appearance to jewellery, to affirm that the other will be much more chaste, and be so far out of the common as to give full satisfaction to any lady wishing to show some individuality in her ornaments. For a rather more expensive brooch select any of the green varieties of stones—tourmaline, peridot, or chrysoprase: olivine would be rather too strong for this size—of about five carats weight; make the setting around the stone as open as possible, the gold mostly 'knife-edged' (to give strength and yet show little surface), but the scroll parts broadening out so as to hold a setting of diamond chips or sparklets set in platinum, and we have another extremely effective piece of jewellery. If the purse will allow it, a few—four or eight—well-cut small diamonds in the open spaces round the stone will greatly enhance the appearance. Of course those who cannot afford such an addition will consider diamonds vulgar; but those who can may well allow this thought to pass unchallenged.

While gold alone has been referred to as a material for mounting, other metals may very suitably be employed. With warm-tinted stones the colder-looking, but strong and durable, platinum may quite well be used; while oxidised silver is artistic, but is easily tarnished. Gold, therefore, either bright, dull, or coloured to suit the stones, is on the whole the most serviceable and gives the richest appearance. For ear-rings, small green tourmalines cut in 'brilliant' shape may be selected—about one to one and a half carat the pair—set as studs, but having the gold as open as possible so that the play of light may fully bring out the sparkle of the stones. This may be varied by a pink or a rose pair set as 'drops,' with only a thin band of gold round the 'girdle' of the gems, and with one, two, or three small diamonds set in platinum above the stones. These are exceedingly handsome and suitable for 'dressy' occasions.

For another illustration, choose, say, a rose-tourmaline of seven or eight carats, and select a pleasing design of gold scroll-work suitable for a pendant. In the open spaces could be inserted four or six small green stones—olivines or tourmalines—and the points filled up with pearls, taking care to have a fairly large cluster at the foot. Instead of pearls, small yellow topazes might be selected, and then one would have a study in stones complete. Another suitable variant would be to employ enamel-work in the mounting, but the expense of the better class of this style of decoration is usually more than its appearance justifies. This kind of ornament lends itself especially well to the introduction of coloured stones, and forms an extremely pleasing decoration. In pendants and necklaces more than in almost any other article of jewellery can coloured stones be used effectively. If the colours are kept soft and made to harmonise nicely, tasteful and chaste effects are obtained. Ladies designing and wearing such ornaments may rest assured that they are not only *la mode*, but in the forefront of fashion at the present time.

The chief drawback to coloured stones in jewellery is that they can be so easily imitated, and the use of 'paste' imitations and inferior stones tend to make ornaments of this kind become so common that many ladies do not care to wear them. This drawback, however, applies even to such stones as diamonds and emeralds—the most expensive ones we have; and ladies by careful choice of stones, by applying their artistic taste in designing and wearing such jewellery—just as they would employ all their own taste and their dressmaker's skill to secure a frock that would have the distinctive stamp of quality—may by the judicious use of coloured semi-precious stones procure ornaments that not only afford pleasure to the wearer and the spectator, but are things of beauty and a joy for ever.

On the other hand, the attraction of such jewellery is that ladies may have everything *en suite;* that is, bracelets, ear-rings, brooch, pendant, and dress may all match, or pinks and greens may be blended so as to harmonise. If care and judgment be used in the selection of the stones and ornaments, as well as of the dress, ties, and blouse to match, there is no great fear of even the 'mere man' thinking the ornaments have been simply thrown in by the draper with the blouse. Great ignorance, however, prevails with regard to coloured semi-precious stones, and not a few ladies, otherwise well informed, are unaware how cheaply and effectively they can procure these ornaments, which are as necessary to the Parisienne, and French and Italian women in general, as are shoes and hats. Only last Easter the writer bought a few pretty green tourmalines in Nice, and on his showing them to an English lady in the same hotel, who was well dressed and wearing as much valuable jewellery as good taste allowed, she exclaimed, 'Oh, where did you purchase the pretty

emeralds?' These stones cost several pounds each, but had they been emeralds of the same size they would have brought perhaps several hundreds each. The remark serves to show that there is a considerable lack of knowledge regarding coloured precious stones, and it is hoped this article may do something to turn ladies' thoughts to the uses of such fashionable adjuncts in the making up of inexpensive and artistic ornaments for personal adornment.

DICK HELLIFIELD'S DOUBLE.

By ALFRED COLBECK, Author of *The Dyserth Diamond*, &c.

IN FOUR CHAPTERS.—CHAPTER I.

S the great liner entered the Canal, and the low minarets and the uneven and flimsy buildings became more sharply defined in the morning sunlight, I came on deck and instructed the steward to place my modest portmanteau beside the bridge-like gangway which the men were preparing to run out and drop ashore. It was my first visit to the East. I was a trifle excited by the appearance of the straggling town, and mildly interested in the monotonous yellow expanse pierced by the long silver thread which connects the Old World with the New. Everything was strange to me. The liner slowed down and slid alongside a double row of coal-laden lighters. These were moored, stem and stern, close to the masonry which here formed the bank of the Canal, and the steamer towered above them like a high wall. Beyond the lighters, along the shore, a few people were collected, calmly watching us, in dress and speech and manner sufficiently varied to reveal that this midway hostel of the world was indeed cosmopolitan; but as I was expecting no one to meet me, and intent only on quitting the ship, I paid them very little attention.

'Hallo, Jim!' cried a familiar voice; and, turning to locate it, I saw below me the upturned face of Dick Hellifield. His dreamy eyes, shaded by a white pith helmet, had caught sight of me, and he looked fresh and cool in his thin white flannels. The attire had deceived me; otherwise I might have picked him out from the crowd.

'Good-morning,' I called out, with a slight inclination of the head, as if I had met him casually in the street at home and not here on the highway of the world.

'Good what?' he shouted, with a whimsical smile.

'Morning,' I repeated. And the smile became a laugh.

Certainly it was a bit ridiculous, but it was the first thing that came into my head to say. Although I was not expecting him, I had sent him a brief message, and thought he would turn up in Cairo. His appearance at Port Said to greet me before I landed did not surprise me; therefore the 'Good-morning' dropped from my lips unpremeditatedly and quite naturally, even if it were a bit ridiculous. We had not seen each other for nearly three years.

'Stand back, please,' said the third mate; and, after he had been obeyed, the gangway rattled out, and was lowered over one of the lighters to the edge of the Canal.

Ere it touched the ground a swarm of Arab porters had leaped upon it, and came rushing up the incline to the deck. They gathered about me and the few others who were waiting to disembark, jabbering, vociferating, contradicting—all except one, who looked at me with a conscious smile, and promptly lifted my portmanteau. I placed my foot upon it.

'You no want go ashore?' said he in amazement as it dropped to the deck again. 'Mis'r 'El'field—he send me—say you want go—I Mis'r 'El'field man.'

'That makes all the difference,' said I, releasing it and trotting after him down the gangway.

The coal-heavers had already begun their work, running up the planking in rapid succession, each one with a full basket on his shoulders, tossing the coal into the bunkers, and running down the parallel planking into the lighter again. Like busy black ants they seemed, working with mechanical regularity, and raising a cloud of dust detrimental to Dick's white flannels, to say nothing of an impaired breathing apparatus with which I happened to be afflicted; and Dick drew me out of the reach of the floating particles of carbon before he spoke a word. His 'man' was already far up the street with the portmanteau.

'Well,' said he as we slowly followed the vanishing Arab, 'you're the coolest beggar alive.'

'How's that, Dick?' I asked.

'"Good-morning!" But, I say, what have they been doing to you?' And he scanned my face with a touch of anxiety.

'No end of things. The *grippe* took me first—a beastly business; then pneumonia set in—more beastly still; and when Fozard got me breathing again with something like decent ease, he said I must come out to Cairo for the winter. No nearer place would do. So here I am, Dick, and it's very good of you to meet me.'

'It's very good of you to come, you mean, and a godsend to me just now. Old Fozard's a brick. Why did he specify Cairo?'

'Because of the sunshine. He said it would be better than all his physic'——

'Which I can well believe.'

'I must get away from England, so he said, into a perfectly dry air, where the sun could play upon me, and sift into me, and work its own natural cure; and he recommended Cairo.'

'He's a sensible M.D.'

'Can you trust that chap with the portmanteau?' I asked; for he had disappeared by this time, and I was by no means sure of him.

'With more than that, Jim. Don't you trouble; he's all right. And here we are at the Hôtel d'Angleterre, where I've bespoken a room for you.'

I had breakfasted on board, and Dick declared himself hunger-proof until the time for *déjeuner;* so, after inspecting the room, we sallied forth to see the sights. Dick insisted that I should discard my Western headgear in favour of a topee that would shield my neck and forehead from the sun, and assisted me also in the selection and purchase of a suit to match his own. The change was welcome. Very much warmer was it strolling about the town than basking on the deck of the moving liner. Fozard had evidently sent me to the right place for sunshine. We booked our passages by the little steam-launch which was due to leave for Ismailia the following morning. In our rambles, both before and after *déjeuner*—considerably after, for the middle of the day was very hot—we were attended by Ahmed, Dick's 'man,' who kept his distance but was always within call.

'You haven't told me how you come to be in Port Said, Dick,' said I as we sat on the balcony of the hotel when dinner was over.

'Oh, that's easily explained,' returned Dick. 'When your message arrived—with precious little in it, by the way, except that you were on the sick-list and meant to catch the liner at Marseilles—I totted up the rest-days that were due to me, and found they had accumulated to twenty-five. So I marched off to the chief and showed him your letter. I had been sweltering on the barrage for a considerable time, and he knew it. We were not short-handed, and he could easily spare me. So he said I might go.'

'And you will spend the twenty-five days with me?' I asked, no less surprised than delighted.

'Twenty-two of 'em, Jim. Three have gone.'

'That's splendid.'

'And another week or so at Christmas.'

'Why, I'm in clover!'

'In millet, and lentils, and sesame, and cucumbers, and—— Well, Ahmed, what is it?' for the Arab had slipped silently through the glass doors and stood before us.

'I have seen him, Mis'r 'El'field.'

'Where?'

'In the lounge at the Hôtel de Paris. He came from Ismailia to-day.'

'You'll take my room, Ahmed?' and a meaning glance passed between them. The Arab bowed and retired. Then, turning to me, Dick said, without offering any explanation, 'There are two beds in your room, Jim—I selected it purposely—and, if you don't mind, I'll occupy one of them. It's large and airy, and we've been together before. You don't mind?'

'Not in the least. I should prefer it.'

'Thank you.'

The conversation turned upon home affairs. It was a lovely night, clear and balmy, with a moon full-orbed hanging in the depths of a wonderful sky. The balcony overlooked a public square, across which the people were constantly moving. We conversed, lazily pulling at our cigars and watching the smoke ascend and disperse in the still atmosphere, until at last we lapsed into silence. Dick suddenly sat upright and drew his fingers across his brow; at the same moment, from the square below, a revolver-shot rang out. The ball buried itself in the woodwork over our heads. There was a slight commotion in the square. The people ran together to see what had happened.

Dick smiled and lifted his eyes. 'It's rather hot here, Jim.'

'Rather,' I replied; 'hotter than Fozard thought it would be. He never mentioned revolvers. I feel like going in.'

'Yes, I think we'd better. That fellow's a bad shot.' We passed through the glass doors. 'And a fool, too, to fire in this uncertain light.'

'Do you know him?'

'I could guess his name at twice, and guess Jerusalem the first time. Yes, I know him, and he evidently knows me. He's a slippery customer. Did you notice how he got away?'

'No; I did not see him at all.'

'He had vanished when the people ran together. There was a convenient passage behind him, communicating with a gambling-den, and he was in it while the smoke of the revolver was hanging in the air. Well, perhaps I needn't have troubled you by changing my bedroom after all.'

'Who is he, Dick?'

'I'll tell you when we get to Cairo.'

'You are in danger, Dick?'

'Perhaps. Who knows? He couldn't hit me then, but he may if he tries often enough. Yes, I think I'll tell you when we get to Cairo. It might serve a good purpose if he does pot me at the last.'

This event, following upon the brief conversation between Dick and Ahmed, and Dick's request to share my room—happening, too, so soon after my arrival—did not contribute to my composure; and when my mosquito-curtains were tucked in and the light was extinguished I closed my eyes in vain. Sleep for a time deserted me. I wondered what it could mean. It did not seem to trouble Dick. He slept peacefully enough, and I could hear his heavy and regular breathing long before I became drowsy. When sleep did come, pressing me down, despite my thoughts, into a blissful unconsciousness—for I was weary with the long day—it was dreamless and undisturbed; and I awoke after my usual hour to

find that Dick was up and dressed, with a smile on his face and his eyes beaming like new-fed lamps. He had slept the sleep of renewal, without a tinge of fear.

If Ahmed had been disturbed at all he was silent about it.

The steam-launch was moored stern-on to the steps of the quay. It was like a mannikin aping its elders. So small was it that it could have been dropped bodily into one of the funnels of the liner. Amidships, over a tiny saloon, was a raised promenade-deck, about seven feet by five, encumbered by the steering-wheel and protected by polished brass stanchions. It boasted a miniature fore-peak and a well-deck aft, with a poop projecting over the twin screws. Dick and I skipped up the five-stepped companion to the limited promenade; but Ahmed, having seen to the stowing of our luggage, remained on the poop.

As we cast off and the screws began to revolve, a man in black, with a red fez, ran towards the steps. He was very nimble—a lithe man, with a thin brown face and glittering dark eyes. I saw Ahmed draw himself up and stiffen as the man approached and sprang from the steps to the poop. It was cleverly done, but the next instant he was in the water. I could not be certain how it had happened. It seemed to me as if, in the very moment of his alighting, Ahmed had twisted his instep about the ankle of the new-comer. The impetus of the leap, however, and the impact of his body on the already moving boat, may have accounted for it, and apparently did account for it to the passengers and the crew. Certainly a craft so light would oscillate to the slightest touch, and no one seemed to wonder that the leaper had lost his equipoise. He dropped with a splash, half-doubled up, and attempted to save himself by clutching at the gunwale; but when he rose to the surface he straightened himself out and struck at once for the shore. His fez was bobbing in the wake of the launch. The skipper signalled for the reversal of the screws. But as he scrambled, dripping, up the steps he shook his head and waved the launch away; and, indeed, he was in no condition for the journey. The signal was cancelled; the launch, which for a moment had hung in its track, made way again; and we were followed across the harbour by the would-be passenger's malignant gaze.

'That's the fellow who shot at you last night,' said I in an undertone as we cleared the harbour and entered the Canal.

'You've made a shrewd guess, Jim,' he replied; 'that's the man.'

'Ahmed dropped him overboard purposely.'

'As you say, purposely, to save possible trouble between here and Cairo. You saw it, then?'

'Yes—at least I half saw it; the trick was done so neatly that I could not be quite sure.'

'You've sharp eyes. No one else except myself half saw it; and I should have been in doubt, like you, but for my knowledge of Ahmed. A cleverer servant there could not be. Thanks to him, we are free from a decidedly unpleasant espionage, to put it mildly; it might even be from an attack like that of last night—an attack upon myself, of course, not upon you. How are your nerves, Jim?'

'Fairly fit. I don't jump at a little thing.'

'Because I shouldn't forgive myself, and I'm sure Fozard wouldn't forgive me, if you were to begin to worry and wear 'em to fiddle-strings. It's nothing—a mere bagatelle; only the chap seems to be a bit persistent. I thought I'd shaken him off. I didn't expect he would follow me to Port Said, else I wouldn't have come. I could have met you in Cairo.'

'I'm glad you came, Dick, for all that.'

'Are you?' and he turned upon me his dreamy gray eyes. 'Well, he'll not trouble us now; perhaps not again. You may dismiss him from your mind;' and he began to talk about other matters, calling my attention to the sandy banks of the Canal, to the camels on the ridges, to the dredgers scraping up the silt, to a large Far-Eastern liner approaching us, as if he had entirely forgotten the man whom Ahmed had tipped into the tide.

When we entered the Canal, Ahmed, certain now that the man could not follow, retired into the saloon, stretched himself at full length on one of the cushions, and fell fast asleep; nor did he waken until we curved into the wider waters and ran alongside the landing-stage at Ismailia. From this I concluded that he had had no sleep during the night. Straight from the landing-stage, up the dirty avenue of stunted trees, we walked to the railway station, leaving Ahmed to bring on the luggage. There was barely time for a hasty luncheon before the starting of the train. On we went through Tel-el-Kebir, with the pleasant little English cemetery beside it, to the junction at Zag-a-zig, there to be delayed a while, and then forward to Cairo, where we arrived a few minutes late.

'We will put up at the Esbekieh, Jim.'

'You know best, Dick. I am in your hands.'

'It overlooks a public square and the gardens, and is not so retired as some of the hotels; but it will suit us very well. It is Nubar Pasha's old place. The bazaars are near, and we can get away conveniently wherever we like from there.'

When we were settled and dinner was over, Dick and I sought a balcony on the second floor upon which our double-bedded room opened, and, smoking serenely, watched the changing scene in the square below. Much more lively was it than in the square at Port Said, and the mingled noises from the bazaars at the back fell pleasantly on our ears. When the evening was far advanced Ahmed presented himself, and received his instructions for the morrow.

'He cannot reach Cairo until the day after to-morrow,' said Dick when the other matters had been disposed of.

'Not easily, Mis'r 'El'field. There is no boat.'

'Can he at all?'

'By hiring.'

'You will keep your eyes open?'

Ahmed shrugged his shoulders and spread out his palms, as much as to say, 'You may safely trust me to do that,' included both of us in his ceremonious bow, and silently withdrew.

'He is invaluable,' remarked Dick when he had gone; and I was inclined to agree with him. But I wanted to know more. Dick, however, was not disposed to satisfy my curiosity. He began to chat about home, and I had to wait.

(To be continued.)

NIGGER STORIES.

By JOHN D. LECKIE.

WE are all apt to form very erroneous impressions regarding races of people of whom our total knowledge has been gained by reading about them—perusing accounts which are too often the superficial impressions of transient travellers. Even a short and witty epigram has sometimes unjustly branded a people with a defect or bad trait which they do not really possess. For example, the Scotch visitor to London soon finds that his countrymen are regarded in the Metropolis as the possessors of two unenviable traits—namely, stinginess and the inability to perceive a joke. The latter of these impressions is to be traced to Sydney Smith's celebrated saying that it requires a surgical operation to get a joke into a Scotchman's head, although the editor of *Punch*, who may be taken as an authority, has stated that his best jokes come from north of the Tweed, a part of the country which has certainly produced its share of literary humour. With regard to the imputation of stinginess, if we were asked who were the most generous persons in existence we would be inclined to mention Mr Andrew Carnegie, who is a Scotchman, and the next half-dozen names of most generous persons (excluding Americans) would probably be Scotch, Scotch-Irish, or Scotch-Canadian. In short, the imputation of stinginess and stupidity cast on the Scotch can only be the result of second-hand impressions as distinguished from actual acquaintance with the people, and few Englishmen who have lived north of the Tweed will dispute the statement.

This digression is merely intended to show how erroneous may be the impressions we have of our nearest neighbours; and, if so, how much more erroneous will be the impressions we have of races of whose members we have no personal acquaintance! We are apt to base our impression of the negro on a few epigrams in the same way as we have done regarding the Scotchman.

People who have no intimate acquaintance with the negro race are apt to take it for granted that the only difference between a black man and a white man is the colour of the skin; in fact, we hear the assertion daily in the mouths of stay-at-home Englishmen. Alas! if this were the case, the racial problems which figure so prominently in the United States and some of our own colonies would be of easy solution; but unfortunately any one who has lived long among negroes is aware that the two races are cast in an entirely different mould, physically and intellectually, and the ignoring of this fact (even by would-be philanthropic legislators) has led to more than one insurrection and racial war. Again, many of our own countrymen in the general appellation of 'negro' include all races which possess a black skin, such as the Hindu, who, though of swarthy colour, belongs to the same Caucasian race as ourselves.

The word 'negro' in this article is used in the restricted sense and more general acceptance of individuals of the Bantu stock, which includes the blacks of Central Africa and their descendants in America. It is foreign to our purpose to discuss the vexed question of whether the African negro is capable of acquiring the intellectual abilities and high civilisation of his white brother; but there can be no doubt about the capabilities of the Hindu in this respect; in fact, the inhabitants of India enjoyed a high civilisation at a time when our British ancestors were bare-backed savages.

Neither is it the object of this article to describe in detail the peculiarities of the negro character. To do justice to such a subject nothing less than a complete volume would be adequate. On the contrary, the following anecdotes, as will be gathered from the preceding remarks, must be taken with the same grain of salt as Sydney Smith's epigram on the Scotchman—to a certain extent exaggerated and perhaps of doubtful veracity, though not devoid of local 'colour,' and to a certain extent they reflect the opinion held of our black brethren in the United States.

Stories with regard to the physical peculiarities of the negro are numerous, and of these not a few refer to the supposed thickness of the African cranium. Two planters in the West Indies, A. and B., made a bet in this connection. A. wagered a considerable sum that a negro could break a cheese with his pate, B. taking up the bet in the negative. The cheese, of portentous size, was duly produced, wrapped up in paper, and placed on a suitable pedestal. While A.'s attention was distracted, B. abstracted the cheese and put in its place a grindstone of equal size, wrapped, as the cheese had been, in paper. The negro, quite unaware of the change, ran full tilt with his head against the supposed cheese, the result being that the grindstone was

smashed into a thousand fragments. But Sambo afterwards admitted that it was rather a hard cheese! Perhaps this is the origin of the slang expression which was current in our schoolboy days, 'to get a cheese,' in the sense of being 'sold' or 'taken in.'

A gentleman owning a sugar estate in Demerara went out to visit it for the first time. The day after his arrival he stood watching the punts bringing the cane home. A young negro boy who was driving the mules, wishing to increase the speed of these, struck one of them with his whip. The mule promptly responded by launching out with his heels, and dealt the boy a kick on the head which stretched him on the ground, where he lay rubbing his woolly pate on the spot where the kick had been received. 'Is he hurt? Is he hurt?' cried the planter in alarm. A full-grown negro, hearing the expressions of concern, sprang forward hastily, and, raising the mule's heels, shouted out, 'No, boss! That mule him walk tendah fo' a day or two, but him no' hurt.

Stories of the kind might be repeated indefinitely, as that of the negro who fell on to a granite pavement from the twentieth story of a New York sky-scraper, but miraculously escaped injury owing to the fact that he fell on his head; or of the negro who, when passing along the street, exclaimed, 'Who's that spitting up there?' when a shower of bricks fell on his cranium from an equal height.

Another source of mirth is the negro's pedal extremities. According to Tom Cringle, they are built on the broomstick principle—quite as much of the foot on one side of the shank as on the other. 'What for you tread on my heels?' exclaimed one indignant darky to another. 'What for you got heels like toes?' was the prompt rejoinder. If Nature has provided the negro with an invulnerable cranium, we are told (also on Tom Cringle's authority) she has adjusted the balance by constructing his shins in such a manner that they form the weak point of his anatomy. No one would ever think of giving a darky a blow on the head, but a few raps on his nether extremities will send him howling with pain. Yet the soles of his feet, in close proximity to his shins, would seem to be endowed with a toughness almost equal to that of his skull, if the following story is to be believed. A Southern planter was out hunting with some friends, and camped out at night in the woods. A fire of pine logs was kindled, and round it the party resigned themselves to sleep, each one with his feet pointing towards the blazing pile. During the night the planter awoke, and was surprised to perceive a distinct smell of roast-beef. Waking his black servant Pompey, he resolved to solve the mystery. Pompey sniffed for a moment, and then replied, 'Seems to me, massa, some one is burning his foot.' The fact seemed incredible; but after further investigation Pompey ejaculated, 'Why, sure 'nough, it is my own foot that is burning;' and he pointed to his naked pedal extremities. His sense of smell had been aroused before the sense of touch.

Illiteracy, as might be expected, is very general among the Southern negroes, and there are (or were) few who have even an elementary knowledge of arithmetic; though not wanting in natural shrewdness, they are apt to be overreached by their unscrupulous white brethren. A negro, who had made an arrangement with a Southern planter to sow a plot of land with corn, had agreed to receive in return a certain proportion of the crop. Relating the transaction afterwards to a friend, he remarked, 'Colonel X. wanted me to take the land on shares, and offered me a fourth of the crop; but I was not satisfied. I held out for a fifth, and I got it. You can't fool this nigger.'

Among the charges brought against the Southern negro, and also against his West Indian brother, is that of a propensity to petty larceny—he is supposed to have a special weakness for his neighbours' fruit and poultry. A Southern negro had been charged with the offence of chicken-stealing, and among the witnesses summoned was a brother darky. On being asked what he knew about the character of the accused, he refused, with characteristic caution, to make any incriminating charge. The prosecuting lawyer, who was well acquainted with the negro character, had to use a little diplomacy. 'I don't want to say anything against Abe Johnson, the accused,' he remarked; 'but if you were a chicken, and Abe Johnson were around, what would you do?' 'I would roost high,' was the prompt reply.

An excellent, if perhaps unjust, picture entitled 'Injured Innocence' depicts a darky boy who has been charged by a neighbour with stealing his chickens, to which he indignantly replies, with a face which is the very picture of injured innocence, 'Get away, white man! Don't insult a boy if he am brack. Do I look as if I could steal chickens? Do you see any chickens about me?' all the while in blissful ignorance of the fact that half-a-dozen small chickens are thrusting their heads out of his tattered hat, which he had trusted would conceal them.

During the Civil War in the United States, especially during the last years, the Southerners were often in sore straits for supplies of all kinds. During this period a Southern judge was rather surprised to find a turkey on his table, stuffed according to the best rules of the art. As he had no turkeys in his poultry-yard, and he knew that the sum he had given to his cook for household expenses did not run to a turkey, he called the sable servant and asked for an explanation. 'Why, massa,' replied Sambo, 'it is like this. That turkey has been roosting three nights on our fence, and last night I grabbed him for the rent of the fence.' It is not on record whether the judge was satisfied with this explanation.

In the West Indies colour is the badge of rank even more than trade or occupation. Imagine, therefore, the disgust of a white lady who called from her carriage to a coloured woman, when, not

receiving a reply, another 'fair' darky hailed the woman as follows, 'Say, brown lady, you no' hear white woman call you?'

Some time ago, when it first became fashionable to drive in a carriage with a raised seat behind for the page or footman, this new style of equipage attracted the attention of a black woman passing in the street. A young lady was seated in the carriage, while on a raised seat behind a coloured page sat with folded arms. 'Bress de Lord! bress de Lord!' exclaimed the negress, as she held up her hands in astonished rapture, 'many a time I have prayed for it, but I never expected to see it. I wonder how much that young coloured gentleman pays that white woman to drive him out.'

It is to be regretted that nearly all the foregoing anecdotes show the negro in an unfavourable or ridiculous light. Yet it must be admitted that the descendants of Ham possess many amiable qualities, not the least of which is an intense devotion to their masters and an extreme attachment to the plantations on which they were born and bred, sentiments pathetically expressed in many a fine plantation-song. At no time was their fidelity more noticeable than during the Civil War in the United States, when the South was almost depleted of its male white population, nearly all the able-bodied whites having been sent to the front. Yet, notwithstanding the fact that the Southerners left their plantations practically at the mercy of their negro slaves, and in spite of the efforts made by the North to produce a servile insurrection, throughout the whole course of the war there never was the slightest attempt on the part of the slaves to rebel against their masters; on the contrary, they followed their owners as camp-servants in the field, and their devotion seemed to be in no way abated by the emancipation proclamation of the enemy. So much confidence did the Southerners place in the fidelity of their slaves that a Bill was introduced in the Confederate Congress towards the close of the war for the arming of two hundred thousand negroes, and no one acquainted with the actual state of affairs in the South will doubt that the planters' confidence in the fidelity of their slaves was well deserved, though the latter well knew that their adhesion to their masters had the effect of riveting the chains of slavery more firmly round their necks.

Previous articles on this subject are 'Hayti under Negro Government' and 'The West Indian Negro' in *Journal* for 1901, and 'Up from Slavery' in 1902.

A WAX-CANDLE.

By THEODORA WILSON WILSON, Author of *T' Bacca Queen, Langbarrow Hall, Ursula Raven, A Navvy from King's, Helen and Cecil Sketches in 'Punch,'* &c.

PART I.

BILL HENDERSON was not liked by the men. He was silent, reserved, and 'queer.' Yet he had a way with the women, and the miners' daughters watched his movements with jealous interest. He was of medium height, plump in countenance, and slightly round-shouldered. He shaved three times a week, and wore a velvet coat on Sundays.

Henderson was, moreover, better educated than his mates at the lead-mine, and he never wore quite so self-satisfied an expression as when he thought he had discovered some mistake in the management. His schemes were a regular cause of jest amongst the men; yet he said his say, and demanded interviews with the young manager; and Leigh Masters, who believed in living in good fellowship with his workpeople, always paid Henderson the compliment of listening seriously to his suggestions.

Henderson's latest fad was on the subject of candles. He objected to the tallow-candles served out by the storekeeper, insisting that wax-candles would give a better light; and one Saturday in early October he informed his mates that on the following Monday he intended to prove his point.

The suggestion was received with the usual good-humoured howl of derision; and Jimmy Graves, Bill's fellow-worker in the same stope, voiced the general sentiment when he remarked scornfully, 'Wax-candles! They'll blow out before you've chucked your match away. More like you're wanting them to wax your moustache to go courting with.'

But time was too precious to waste over the discussion of Bill's fads, and every one rushed off to clean up for the afternoon's enjoyment.

Henderson, accustomed both to scepticism and chaff, went to clean up like the rest. Yet, when he had accomplished that somewhat lengthy process, he eschewed the crowd at the football-field, and wandered off alone.

It somehow happened that as he passed the old mill, Janey Bowker, the miller's daughter, also dressed in her Saturday best, was standing at the little gate, wondering how long her careless lover, Jimmy Graves, intended to keep her waiting.

Janey was all on edge with Jimmy. He was certainly the biggest and handsomest young fellow in the village; but handsomeness was not everything. Even an easy-going good-nature palled when it degenerated into careless selfishness. Jimmy and

she had been walking out for nearly two years; and though Janey could not have expressed her dangerous irritation, she instinctively felt that he was using this fact as though it gave him the right to take or leave her as he chose. 'We might be married, the way he goes on!' so she grumbled. Even this very afternoon—oh dear, yes! Janey could guess well enough where he was—Jimmy was doubtless watching the League match. If he had been playing and messing himself up from his boot-tops to his curly pate she might have excused him, for football was football, as all the village knew, and she might even have gone down to the field to watch him. But Janey knew that Jimmy had been sent back to reserve because the committee was uncertain whether at any critical moment he would exert himself to buck up. He had, no doubt, on this afternoon entirely forgotten that he had promised to take her nutting. Well, if he didn't care, she was sure she didn't either.

Having come to this convincing conclusion, it was noticeable that when Bill Henderson happened to walk casually along the lane, Miss Bowker did not retire from her position at the gate, but passed the time of day in response to a deferential greeting. Then she bridled and tossed her head, and remarked with some asperity that menfolk were neither worth raising nor bothering over when they were raised.

'You shouldn't smear all folk with the same wash, Miss Bowker,' said Bill, with a grand enticing indifference.

'And why not?' she demanded, sure of the answer.

'Because—— Prove the answer for yourself, miss. It is a grand afternoon.'

Janey gave a short giggle, snapped the gate behind her, and the two strolled away.

By dint of judicious management—hedge-hugging and standing in tree-shadows—Janey and her companion managed entirely to evade the eyes of the neighbours.

The walk was quite the most exciting Janey had ever had. Certainly Mr Henderson was not so big as Jimmy; but his arm swept round her waist quite easily, and tightened more comfortably. Besides, his handkerchief was scented.

Perhaps she missed the vivacious, gossipy chat she generally had with Jimmy; but then this man said such wonderful things about herself in such beautiful language. And when she remembered the number of girls who, she was sure, would now wish to strangle her, and all the chilling speeches she could now pour forth upon Jimmy, she decided that excitement was life, and that life was worth living.

On reaching home at a reasonable hour—for Henderson always courted respectably at the beginning—her mother demanded why she had not brought Jimmy in to supper.

'He can get his supper anywhere he likes for what I care,' said Janey recklessly. 'I've had my fill of him. He thinks I'm nothing but an old spade lying in the hedge-bottom, that he can use, or shift, or leave to rust just as he has a mind. Jimmy can find himself another.'

'What do you mean, lass?' demanded her mother. Mrs Bowker was a middle-aged person who for long years had been under her daughter's thumb. 'Wasn't yon Jimmy, then?'

'Jimmy can go and hang himself! I was walking out with Mr William Henderson, and I don't care who kens it.'

On Sunday Janey went to church, and so did Bill. He wore his velvet coat, and a late rosebud in his button-hole, and he sang in the choir.

In all this he scored, for Jimmy believed in a day of material rest, and only rolled himself out of bed as church 'came out' and the scent of his mother's Irish stew became insistent.

That afternoon he spent sitting on the parapet of the bridge, gossiping to his mates, until it struck his weary mind that he might as well be off home to get his tea.

After tea, of course, it was absolutely necessary to have one pipe before starting out to see Janey.

During this operation Joe Waters, the clown of the mine and the village, looked over the wall.

'Come in, Joe, my lad,' called Jimmy affably. There was always fun to be got out of Joe, and there was no hurry to start for the mill.

Joe vaulted the gate, and came up the path with an ironical grin quivering his long slit of a mouth.

'The joke, you born fool!' demanded Jimmy composedly.

> **'Where 's your lass to-night, Jimmy—**
> **Jane o' Bowker's mill?**
> **Better hurry yourself, Jimmy,**
> **Or t' lass will get her will.'**

So he sing-songed out the impromptu doggerel, pointing with his thumb over his shoulder in the vague direction of the mill.

'What do you mean?' demanded Jimmy.

'Ay, what?' laughed Joe. 'When folk holds a young filly over loose in the halter, a toss of her head and she's off.'

'Talk sense,' said Jimmy, his colour quickly rising.

'And who isn't? If a lass can't get what she's after from one, she'll get it from another, you bet, you young chimney-pot lunatic! If you want Janey Bowker you'd best get t' banns called out on Sunday. So long.'

Joe vaulted over the gate and ran off down the road, almost bent double, and laughing hilariously.

Jimmy bestirred himself unwillingly, yet resolutely. His Janey walking out with any one else! The idea was quite unthinkable. Why, every one knew they were going to be married. Hadn't she

started her bottom drawer? Hadn't he given her a sewing-machine, and bought a chest of drawers only last week, with the handsomest glass handles in the village?

And yet—— A flush shaded his handsome cheek, and a look of genuine anxiety worked its way into his eyes. In a flash little awkward happenings crossed his mind. He remembered certain odd sentences from Janey or her mother that had been uttered lately. He had been slack—that was all, hang it! Yet Janey had a comfortable home. Why should she want to hurry? He was earning and saving good money, and—well, of course a married man had duties, and was tied up to a thousand curtailments of his liberty, and so he had to put her off. Only last week Mr Masters had offered him one of the new model cottages, with a garden attached.

Mr Masters was a man of instinct, and he had said in a decidedly meaning way, 'Look here, Graves, I have an idea that you would do better work if you got yourself fixed up. Can't you bring that young woman of yours up to the scratch? You shall have the offer of No. 5 until the end of next week.'

And it was because of this same offer of No. 5 that Jimmy now realised, with a revelation of honesty, that he had shirked an intimate talk with Janey ever since the manager had spoken to him. And now, what did that fool mean? Who was it?

Jimmy was no saint. He was good-natured enough when nothing mattered, but when roused his lips whitened and his brown eyes threatened. The desire to know cut him like a leather thong as he dashed along by the river's edge to find out the truth.

He crossed the empty courtyard and knocked with some diffidence at the door.

'Nay, now, my lad, you're over late,' laughed Janey's mother. 'She's about sickened of you. She's off with a better man, and quite right, too. You've turned out to be nowt but a slacker, and she's had enough of pie-crust promises. Them's her own words this afternoon;' and the woman broke into a weak, tormenting laugh, roused thereto by Jimmy's countenance.

'The devil!' said Jimmy, and turned on his heel.

He entered a rough bit of copse-wood and waited. There was plenty of time, and Jimmy's wrath rose with the rising of the moon, and the chill night-air sought in vain to cool his blood.

It was after nine o'clock when he saw them return. Some one had an arm round Janey in the approved style. They lounged across the yard; the light through the white blind showed the figure outlines.

There were low murmurs of talk. Jimmy could not distinguish the words.

But at the porch Janey lifted her face. Then came a quiet sound which sent the onlooker crashing through the wood as though he were flying from the devil himself.

'To-morrow! to-morrow!' so he ground out the words. To-morrow he would 'show' Bill. Bill might do his dirty tricks in the night. He would act in the day, and it should be to-morrow.

PART II.

EARLY on Monday morning Bill Henderson appeared ostentatiously carrying a bundle of wax-candles. His appearance was the signal for a volley of chaff from the men standing at the top of the shaft.

Leigh Masters, taking his early round, saw that a joke of some sort was in progress, especially as Joe asked him, with a twinkle in his eye and a slap of his capacious bosom, whether his master had 'a 'lectric lamp' to spare.

'What for, Joe?' asked Masters.

And Joe, being always a privileged personage, laughed out, 'Because t' tallow from these here common sort of candles drops on my shoe-leather, sir, and t' rats gnaws them into holes.'

There was a subdued guffaw at the smartness of this fabrication; and Masters, not quite understanding the point, and not choosing to inquire, merely returned good-humouredly, 'Get along, Joe! There are no rats about here so hard up as to depend for their living on your shoes.'

But the moment his back was turned Joe offered handsome bets all round that 'yon candles would go out when most wanted.'

It was while the men were meditating on these generous chances that Jimmy Graves, with black thunder on his brow, strode into the midst of them. In a couple of strides he stood close up to Henderson.

'To-night, my lad—at six sharp—you take off your coat. Think on—six sharp!'

'What do you mean?' asked Bill, stepping back, and trying to look imperturbable. A careful onlooker might, however, have seen a suspicious whiteness steal along his temples.

'You ken well enough what I mean. I mean that we've had about enough of your sneaking devilment. I mean that if other lads let you sneak their lassies, they can do as they have a mind. But it means that when you set your line at my lass you met your match. I could have wrung your neck like a cock-chicken from the perch last night, and never given you a second to squeak in. But—give every man his chance, and here's yours. If you've any psalm-singing to get through before six o'clock, get at it sharp.—All of you lads is welcome to come along and see fair-play, and that he gets no more nor he has earned.'

So Jimmy looked round with flushed countenance and straightened shoulders. Every one knew that such a challenge must be met. Every one knew

who would get the thrashing and who would give it, and the sympathy was not with Mr William Henderson.

After all, though they all knew that Jimmy had played fast and loose with his girl, as indeed he had played fast and loose with his football and his prospects at the mine, there was no mischief in him. There was no girl living within a walking-distance of the mine who had ever had reason to curse the great, careless youth.

'Bill will get snuffed out like one of his own candles,' chuckled Joe the fool, digging a mate in the ribs too violently for his friend's comfort or temper.

Bill gave a glance round; then he too tried to straighten his rounded shoulders. The effort failed; but he poked his chin forward, and, looking reproachfully at Jimmy, said slowly, 'You should feel obliged, Jim Graves, that I care to take pity on one of your cast-offs.'

The taunt cut, and the men expected that nothing could save Bill's face from Jimmy's clenched fist.

'Cast-offs!' he yelled. 'I'll wed her afore you can break her heart, you'——

But a burly foreman, Tom Benson, stepped up authoritatively. 'Time's up, mates,' he said. 'Get along.'

Jimmy let the wild words that were coming die on his lips, and dropped his half-raised hand. He turned and stepped into the cage, as did a few more. It seemed as though Bill hesitated to follow.

'You needn't fear nothing till six o'clock,' said Jimmy scornfully. 'I'll not soil my fingers on you till then.' So they descended the mine in bitter silence, and went, mates as they had been for some time, to work in the same stope.

Now, Leigh Masters was undoubtedly puzzled. He had noticed the budding of some joke above-ground, and now, below, he perceived there was an atmosphere of expectancy wherever he went. The men stopped talking as he approached, which was an unusual trick, for master and men were on the best of terms, having fought through many a mining trouble together. Once he had been surprised to come across Joe the fool away from his proper job closely examining a bundle of candles which were hanging at the foot of Bill Henderson's and Graves's ladder. Joe hurried off when he saw the manager, and perhaps all the quicker as he saw Bill appear from above to get his dynamite and fuse to charge a hole that was ready for blasting.

It was the practice to charge the hole with dynamite, leave a fuse hanging out, and then to place a piece of candle under the fuse, and so allow the candle to burn through to the fuse. The use of the candle naturally gave the men a longer time to get away than if the fuse had been lighted direct.

Bill unhooked a candle from his bundle, and took the opportunity of remarking to Leigh Masters that he was trying an experiment with wax-candles which he had bought himself, and which in his opinion were far superior to the common tallow ones.

'Ah!' said the manager, 'it was you, then, with whom Joe was having a joke? Well, Henderson, make your experiment; only, mind you give me the true result later.'

Bill nodded and disappeared up the ladder.

All the long morning the two men worked in silence. Jimmy now and again ostentatiously felt his strong muscles with exceeding satisfaction, thinking hard of six o'clock. Bill meditated on many things, and as hour by hour he furtively glanced at his mate a great terror settled heavily down upon his spirit. How to avoid that fight at six o'clock—that was the ghastly problem; for this was a fight for which the challenge had been openly given, and which must be openly and honourably taken up.

His interest in his new experiment faded away before this difficulty in which he found himself. Yet when the time came to set the fuse Bill doggedly brought out his wax-candle.

Jimmy watched him, but scorned to make any comment. To-day was no day in which to chaff his mate about a mere fad. Yet, to let off his feelings, he gave an extra vicious pick at the side of the cutting.

'Confound you, you fool!' cried the startled Bill as a great piece of rock rolled down the face of the level.

In an instant had happened one of those accidents which are common enough, yet dreadful always, and Jimmy was thrown senseless against a beam of wood.

It was precisely at that moment, after one glance at his fallen mate, that Bill Henderson stooped deliberately to his work.

PART III.

HALF-AN-HOUR later Leigh Masters returned that way. He found Bill standing at the foot of the ladder; his face was ashen-gray, his arms were trembling, and as he clutched at the ladder-rung his knees were bent as though too weak to hold him up.

'For God's sake, what is the matter?' cried the manager. But the man merely looked round with a wild, vacant stare.

Masters pushed him violently to one side, so that he staggered helplessly across the level. He dashed up the ladder and peered anxiously through the dimness, calling aloud for Graves.

All was very still. The long, irregularly lighted stope was silent as death. There was no sound to be heard but a kind of gasping, choking sob from Bill down below.

A mine-manager is not supposed to have nerves; but young Masters felt his throat tighten as at last

he perceived Jimmy Graves hanging over a cross-timber at the working face, a drip, drip of blood falling from his rough, coarse hair. In an instant the manager was all activity. He examined the wound hastily, raised the limp form to some sort of better position, then dashed down the ladder to call the ambulance-men.

Bill was uselessly leaning against the rock, with the same vacant stare in his eyes.

With business-like expedition Jimmy was brought carefully to the surface, and Masters, assisted by his brigade, rendered first aid, pending the arrival of the doctor.

And meanwhile Janey Bowker was hurrying along from the village, her chin raised, and her eyes bright with offence and excitement. At the post-office she had been told that Jimmy and Bill were to fight out some matter at six o'clock, and the woman had hinted that she should know what it was all about, and that she should shame.

Then Joe Waters, out on an errand from the mine, had raised his cap to her, and said mockingly, 'Well, miss, and which of 'em do you want to get smashed up, eh?'

'Which of them?' That was the horrible question. 'It was all Jimmy's fault;' so she murmured to herself, and she was just deciding to go a longer way home to avoid passing the shaft-mouth, when a rushing and excitement attracted her attention.

Something was wrong at the mine! Janey knew the signs only too well. A woman's voice uttered a wild cry, and Janey began to run. Some one was being carried; and the woman—Janey recognised the shawl and the bonnet—yes, and the face—the woman was Jimmy's mother! It was Jimmy, then!

Which did she want to get smashed up? So came the question as, impelled against her will, she struggled forward. Jimmy—her big, strong Jimmy—was hurt—was——

But the manager, raising his eyes, saw her coming, and called hastily to his foreman, 'Here, Tom, keep that girl back, can't you?'

The man came along and laid a firm hand on her arm. 'Here, my lass,' he said kindly, 'shift yourself for a bit. Your Jimmy has got himself lamed, and'——

She knew now, and in an agony of apprehension she broke out, 'He is dead, you liar!' every shred of colour wiped from her face.

'Not he,' retorted the foreman bluntly. 'No; but the manager says as you must shift. He don't want no women-folk about, so clear yourself out, there's a fine lass.'

The girl knew that in all things the master had his own way. As something or some one was carried into the little office she dared not go nearer, but stood by the fence alone, struggling with her anxiety. To think that she had ever spoken and thought of Jimmy as she had spoken and thought! Excuse after excuse rushed tenderly through her heart for this village miner; and above all came the overwhelming thought that, whatever Jimmy's faults, he had never gone with any girl but her. In her grief and humiliation she leaned against the fence, forgot her wrongs, and sobbed her heart out; and, as the long minutes passed, many looked towards her, but none came near.

When the best had been done that could be done, and a vague consciousness had returned, the manager suggested that they might move Jimmy home.

Then it was that the foreman came close up, with news in his eyes.

'Well, Tom, and what next?' asked the worried young man.

'Just above the timber, where Jimmy was lying, sir, there was a blast-hole ready charged, and under the fuse was a wax-candle.' Tom paused.

'Well?'

'Joe the fool had cut the wick beforehand, sir, so that it would not burn, as a trick on Bill.'

'Yes, yes!' said Masters impatiently. 'But this isn't a time to be discussing any of Joe's tricks.'

'No, sir.' Yet the foreman dropped his voice ominously. 'Only, sir, the wick was black. Bill had tried to fire the charge *after* the accident to Jimmy.'

'How do you know?' said the manager hoarsely.

'Bill told us himself, sir. He is clean mazed. He is at the foot of the ladder still. He—he is waiting for the explosion, and—and he wants to go back and stop it, and—and will you come, sir?'

CUPID'S CORNER.

This life is but a winding road, and men the pilgrims on it;
At times 'tis hot and dusty work a-travelling thereon.
Away back in the fairy past they first set foot upon it,
And gaily then the future way before their vision shone.

In truth it proves an up and down of pleasures and disaster,
Of victories and vanquishings, of failure and renown;
With many long and weary tracts they fain would travel faster,
And many hills they fail to climb before the sun goes down.

But yet there waits for every man along this highway passing—
No matter what the odds have been—one hour of sweet content;
A sudden touch that lulls the pain of memories harassing,
A voice that cheereth wondrously the courage almost spent.

Ah me! the road were drear without that dim, enchanted turning,
That corner where the merry god of love forever hides;
For, faring thence, the pilgrim feels within his bosom burning
A mystic joy and ecstasy that still with him abides.

SCOTTISH ARMS IN THE TOWER OF LONDON.

By Viscount Dillon.

BEFORE the disastrous fire of 1841 there appear to have been in the Tower collection 'some curious carbines taken from the Highlanders in 1715,' and many Scotch broadswords; also, 'the Earl of Mar's fine piece exquisitely wrought and inlaid with mother-of-pearl; likewise, the Sword of Justice (with a sharp point) and the Sword of Mercy (with a blunt one) carried before the Pretender on his being proclaimed King of Scotland in 1715.' These and many other objects were consumed in 1841.

The great bombard Mons Meg, whether of Scottish or foreign make originally, at all events was in Scotland in 1489; but in 1754 she was shipped off to the Tower of London, where she was to be seen till 1829, when George IV., at the earnest solicitation of Sir Walter Scott and others, allowed her to be returned to Edinburgh. The only memorial of her temporary sojourn in the Tower is a model there on a scale of about one-eighth.

Apart from arms and armour connected with Scotland, the block on which Lord Lovat paid the penalty for the part he took in the events of 1745 must have an interest for many. As to its history: it is not unnatural that Governments should be disinclined to preserve objects connected with those who have incurred punishment for actions against those Governments. Hence we find that after the execution of the offenders everything concerned with their death should be destroyed. Thus it was that the block on which Lords Balmerino and Kilmarnock lost their heads on Tower Hill, 18th August 1746, was afterwards burnt. Lord Lovat, who was not captured on an island in Lake Morar till 12th June of that year, nearly a month after the battle of Culloden, at which he was not present, was tried on 9th March 1747, and that day month was executed on a new block made for the occasion. Why that one was not also burnt is not known; but in a letter dated 15th March 1825, and addressed to Mr John Poynden by Mr John Bayley, the historian of the Tower, now in the possession of General Sir Bryan Milman, K.C.B., the latter returns his thanks to Mr Poynden for the 'block on which Lord Lovat was beheaded.' Evidently Mr Bayley believed in the authenticity of the object. As to the body of Lord Lovat, the coffin-plates of that nobleman and of his two co-rebels were still to be seen in the chapel of St Peter ad Vincula within the precincts of the Tower. But the late Sir Charles Fraser, K.C.B., V.C., only the day before his death on June 7, 1895, in a letter addressed to the present writer, quoted from a note written by his brother, Sir William Fraser, Bart., the following: 'Lord Lovat's body was at first deposited in the chapel of St Peter ad Vincula in the Tower, the Government fearing popular excitement if it was conveyed to the Highlands. In a short time it was carried to Kirkhill, where it now lies—Inverness-shire.'

Of Scottish arms in the collection of the Tower of London there are not so many as might be expected, and the events of 1715 and 1745 are not recalled by many examples of the spoils of war. Of these, however, the following may be mentioned: a steel-faced target with a thistle in the centre, and also one of those concave-faced targets with central spike which are peculiar to the northern kingdom. There is also another concave-faced target with a thistle-shaped umbo, and with the surface of the shield covered with small brass studs; but this came from the Bernal sale in 1855.

There is in the Musée d'Artillerie at Paris a small gilt buckler of this same pattern, with the arms of England and a portcullis engraved on it. This last target is probably one which belonged to Henry VIII. The English buckler of the sixteenth century was of sufficiently good repute to be considered a fit present among Sovereigns. In 1519, in an inventory of arms at Augsburg, a buckler, a present from Henry VIII. to the Emperor Maximilian, is mentioned. In 1525 Magnus, writing to Wolsey about the young Scotch King James, then thirteen years old, says that the youth 'wishes much to have a buckler, and admires the London

[*All Rights Reserved.*]

bucklers worn by Magnus's servants. It should be made not as if for a child, for that his Grace loveth not but to have everything like unto a man, insomuch that the swords he daily useth are a yard afore the hilts, which his Grace woll as roundly and quickly draw forth and put up again as any man in his Court. His Grace hath heard that the King's Highness, his said uncle [Henry VIII.], at some times weareth and useth a buckler, and that moveth his said Grace to be the more desirous thereof.'

Of staff weapons connected with Scotland there are two specimens of the Jedburgh and Lochaber axes, taken in 1745, and one of these was reported to be the weapon with which Colonel Gardiner was slain at the battle of Prestonpans on September 21. There are also a few of those home-made weapons of the bill class, many of which are to be seen in the northern museums, and which till recent years were the arms of the town-guards and watchmen. Of swords there are a few of the more modern type, but none of the old claymores.

It is worth noting that Lord Archibald Campbell now possesses among his collection some one hundred and thirty-seven sword-blades from the field of Culloden. These, after a certain amount of mutilation, formed the palings of a house at Twickenham. Among them were some Andrea Ferrara blades, and a paper describing this very interesting lot of blades was contributed to the Highland Society of London by their noble president in 1894.

Of Scottish firearms there are some four or five muskets, with the narrow and curved stocks often ornamented by shallow carving which seem peculiar to Scotland. Of these muskets some are transitional, showing the evolution from the snaphaunce to the flintlock. It may be worth noting that first we had the matchlock, which name explains its action; then came the wheellock, in which a piece of iron pyrites was held against the grooved edge of a small wheel which was, by a spring acted on by the trigger, made to turn very quickly some three-quarters of a circle, and so to generate the necessary sparks; next came the snaphaunce, in which a flint was dashed against a 'steel' at the moment that the pan-cover over the priming was moved off. Later came the flintlock, in which the pan-cover and the steel were combined. The word petronel, often wrongly explained as a class of weapon held against the chest (*poitrine*) and not the shoulder, is in reality only applicable to firearms in which the necessary fire is provided by a stone (*petra*), whether of iron pyrites or of flint. All these varieties of locks were in use with guns and with pistols, except the matchlock, which was only (except in very rare examples) applied to guns arquebuses, muskets, culverins, &c.

To return to the Tower firearms, there are a few pistols of Scottish design, but all of poor execution —none of the famous Doune weapons.

There are a number of coarsely made pistols of Scottish design, with the flintlocks constructed on a principle which appears to be peculiar to Scottish firearms. Some of these are entirely of steel or iron; others have gun-metal stocks; but all are exactly similar. Now, in 1739, when the Forty-second or Black Watch was raised, the Highland dress was preserved in their uniform; and Grose, the famous military antiquary, mentions having seen some of the Black Watch still carrying targets and dirks. These were, of course, not parts of the Government outfit. The pistols under consideration appear to have been supplied by the Government, for there was no place in Scotland at that date capable of turning out some hundreds of pistols all exactly alike; and their southern origin is further proved by these Scottish-pattern pistols all bearing on the butts the name Bissell. This name belonged to a firm of armourers working in Birmingham in the eighteenth and nineteenth centuries.

There are in the Tower, also, two weapons of evidently Scottish origin, but in no way connected with the struggles between the English and their northern neighbours. The first of these is a small but well-finished flintlock fowling-piece, formerly preserved in the Rotunda at Woolwich, and always considered as having been made for Charles I. in 1614, when he was a boy of fourteen. The rose-wood stock is inlaid with figures of a rose and a thistle, and the brass lockplate is engraved and bears the stamp R. A. On the end of the priming-pan is the date 1614. Some parts of the lock are wanting, but on the whole the weapon is very interesting. Close to it has been placed a small left-hand pistol of exactly similar design, but with the date 1619 on the pan and the letters C. A. on the engraved brass lockplate. This arm is in perfect condition, and has the lockplate on the left side, Scottish pistols being generally made rights and lefts. It came from the Londesborough and Gurney collections. In concluding this note it may be of interest to some to know that Scottish pistols are to be found in many foreign armouries, as those of Paris, Berlin, Dresden, Sigmaringen, Schwarzburg, and other places.

A PAWN IN THE GAME.

CHAPTER III.—AT BRIENNE.

IT was a late September afternoon in the year 1784. The slanting rays of the sun poured in white flame through the archway into the great court of the military school at Brienne, and burned on its white pavement; but shadows black and cool filled the low colonnade that ran round three sides of it. From one angle of the colonnade there floated out on the drowsy afternoon air a clamour of youthful voices rising and falling in pulses of anger. The trained ear could distinguish the liquid accents of the south, the deeper tones of Brittany and of the west, the hard and nasal tones of eastern France; but all were shrill with wrath.

A boy wearing his coat turned inside out—a token of offended discipline and its penalty—stood in the middle of the court and watched the tumult in the shadowy angle. He was for the moment an outcast from his comrades, and could only look on the scene from a distance with eager, regretful eyes. From a window in the steep roof above, on the opposite side of the square, a Benedictine monk, one of the college Fathers, looked down with an air of detached interest, a smile on his fat and inexpressive features. It was 'a row amongst the boys,' a common incident in a school where monks taught soldiers, discipline was lax, and rebellion chronic.

The sound of angry voices rose suddenly to a shout, and the lad with the turned coat, drawn by an attraction he could not resist, ran towards the crowd of struggling figures from which the clamour came. They were all lads under fifteen, but looked like dwarfed men, for they wore the costume of men—cocked hats, breeches with gray or black stockings, coats without lapels that buttoned at the neck and ran back in a long curve to the tail, revealing vests (with deep pockets) that stretched to the hips. These were the soldiers of to-morrow, and they wore a uniform borrowed from the grenadiers of Fontenoy and Louis XIV.

It was a crowd that effervesced with French rage—a very noisy variety of anger. The queer little military figures shifted their places continually, gyrating in eddies of fury. Their faces were white with anger. They gesticulated like soldiers in the charge. A crowd of British boys at an equal temperature would have been resolved into a mere whirlwind of battle. Blows would have taken the place of epithets. There would have been a general fray, from which they would have emerged battered and breathless, but with good temper restored and the cause of the fight forgotten. But these were French boys, with shrill speech as the chief vehicle of their wrath; and certainly the speech was very shrill, and rose every moment still higher.

A dark-complexioned lad with Italian features was the object on which so much fury was being expended. His brow was black with scornful anger; his eyes gleamed like sword-blades. He was a queer bundle of facial and physical discords. His head was too big for his shoulders. His face was too old for his years. It was the face of a man on the shoulders of a boy. His legs were ridiculously thin for the frame they supported. A hundred shrill epithets were being emptied on him. 'Corsican' was the phrase used oftenest; but 'big head,' 'spindle-shanks,' 'straw on nose,' were also used.

'*Paille au nez.*' Yes, the rigid set of the head, the scornful tilt of the uplifted chin, *did* suggest one who was balancing a straw on his nose. But a glance at the deep-set, wrathful eyes, the menacing lines of the face—a boy's face with no hint of boyish softness—showed that their owner was thinking of something else at the moment than the business of balancing straws. Yet, in schoolboy vernacular, '*Paille au nez*' sufficiently resembled 'Napolione,' the name of the lad with the Corsican face; a name which, slightly altered, was destined to send its vibrations round the world.

The anger fermenting in the boyish crowd was trivial compared with the wrath that glowed darkly in the eyes of the Corsican lad; and the look of deadly menace on those frowning brows, and of power behind the menace, sent every now and again a curious chill through the noisy crowd. But the angry lads in the shady colonnade at Brienne that afternoon had no hint of the stage of tremendous events on which their victim was about to step. They saw only a sulky and unpopular lad who, in some way, had affronted them all; who was a Corsican—that is to say, a foreigner; who was poor, and had no manners; and who pronounced his 'c's' like 'g's'—all of them deadly offences in the code of schoolboy ethics.

The clamour of voices grew steadily in volume. One tall lad named Chambon thrust his jeering face close to the uptilted chin of '*Paille au nez*,' and shouted some mortal insult. The dark, eagle face of the Corsican went white—the white of deadly anger—and he struck at his tormentor, not in English fashion from the shoulder, but as if thrusting with a small sword; and in a moment a dozen pairs of hands were clutching at him and striking him. His coat was rent half off his back; he was bareheaded and dishevelled.

The lad in the court had watched the scene with disgusted eyes. 'The rats,' he said softly to himself; then added in English, 'The curs! A dozen to one!' Then, forgetting his turned coat and his sentence of isolation from his comrades, he ran into the fray. He plainly knew better how to use his

fists than did his opponents. The ring of boys striking at their victim was broken by his attack, a couple of the assailants were knocked down, and the lad with the reversed coat, his face suddenly bright with the joy of combat, stood beside the Corsican.

'They are cowards,' he said; 'and,' he added cheerfully as he stood with his comrade, their backs against a pillar of the colonnade, 'we'll make it rough for them.'

The Corsican made no reply and offered no thanks. With black, unchanging face he steadily watched the little crowd. If looks could have killed, the death-rate at the military school at Brienne that afternoon would have gone up to an alarming height. The interference of the lad with the turned coat added fuel to the human conflagration.

'Cursed Englander!' cried the tall lad Chambon; and a score of shrill voices took up the cry. Then the crowd became less noisy but much more dangerous. The Corsican still stood, chin in air and murder in his eyes; but the other lad fought with vigour and with an oddly cheerful face, and the slender-chested French lads went down before him one after another. But suddenly a stone came whizzing through the air; it struck him on the bare white brow, and left a red splash of blood. Another stone struck the Corsican lad on the shoulder, but he might have been a figure of wood for all the effect it had upon him. Anger held him rigid, with his chin at a yet more defiant angle. The stones were now flying fast; one crashed into the window above the heads of the crowd.

There was the quick sound of hastening sandalled feet, the swish of robes.

'Father Berton!' cried one of the lads in tones of warning, and at the word the crowd scattered and fled.

A Benedictine monk, tall, gaunt, and stern of face, came swiftly along the colonnade; another monk followed him, red-faced and panting. The Benedictine looked coldly at the two lads who remained.

'Another disgraceful squabble, Napolione. You shame His Majesty's bounty.—As for you, Laurente,' said the monk, turning to the younger lad, with angry dislike in every line of his gaunt face, 'you come of a race of savages, and you have the habits of a savage. You disgrace the school. You are a dishonour to the coat you wear.'

'I don't want to wear the coat,' said the lad defiantly. 'And we were attacked. We didn't break the window.'

The Corsican lad was obstinately silent.

'General Keralio has recommended you for transfer to Paris,' said Father Berton to Napolione; 'but'—— and the pause was significant, while the thin lips grew bitter.

The elder monk continued for a moment to look with frosty eyes at the two lads. 'Father Leyrault,' he said, 'take them to No. 10.' Then he paused and reflected. He would not give the two lads the solace of companionship; he had a monkish belief in the virtues of solitude.

'No; let Napolione be in No. 10 by himself.—You, Laurente,' he added, turning to the English boy, 'go to your own room.'

'But,' said the English lad stubbornly, 'we were attacked; we were only defending ourselves.'

'Were *you* attacked?' asked Father Berton coldly.

'No; but the whole crowd was attacking *him*;' and Laurente pointed to his silent comrade.

The two lads were marched off, with Father Leyrault walking majestically behind them.

'You'll lose your commission, Napolione,' whispered the English lad. 'What a shame!'

From an angle of the building, as they passed along, peeped a line of grinning and triumphant faces. A hum of whispered jeers pursued them; it brought a touch of angry red into the cheeks of Laurente. The dark face of the Corsican betrayed no consciousness; but he heard, and his hand went suddenly to his side as though to grasp a sword. No sword hung there; but a light almost more menacing than the gleam of a sword was in his eyes. The fierce look—that had a point of flame in it like a tiny flake of molten steel—scorched the grinning crowd of boys into a sudden and half-disquieted silence. They shrank back as from the actual thrust of naked steel.

CHAPTER IV.—COMRADESHIP.

THE long September twilight had died away; the hum of the school had ceased. Silence lay on the great building under whose steep roofs a small army of lads was being trained, as they imagined, to serve Louis XVI., but in reality for fiercer battlefields than French soldiers had ever yet known. Jean Laurente, as he was called, sat in his room sleepless and fretting. He had listened to the tramp of feet as the cadets passed along the echoing passage to their dormitories. Sleep and silence seemed to envelop Brienne; but the English boy was thinking of his room-mate in No. 10.

'It is a shame,' he muttered to himself, again and again. The instinct of comradeship, the resentment kindled by injustice, and a certain fire of hero-worship which burned in him towards the dark-faced Corsican kept him awake. He pictured '*Paille au nez*,' with his fierce eyes, sitting in the room which served as a prison. He was certain that his comrade would not sleep, and with a boy's unreasoning comradeship he felt he must speak to him and do something to help him.

He was himself a prisoner; but his adroit fingers, with the help of a pocket-knife, slipped back the bolt of the door with an ease which showed the process was familiar. He stepped softly across the threshold of his room and looked down the black

ness of the long corridor. No sound came along it, and with barefooted noiselessness he crept through its gloom.

Midway the great stairs running down to the main entrance broke the line of the corridor, and as the lad stood for a moment at its head he caught a faint sound that sent a thrill along his nerves. He listened and watched. Presently two figures became for a moment visible as they flitted across the light that fell from the window above the great door. The long sloping shoulders of one figure suggested Chambon, but in a moment it melted in the darkness. Something was afoot, some freak of impish mischief, some breach of discipline. Jean listened, but no fresh sound crept through the gloom, and he stole on until he reached the door of No. 10. He scratched on it softly to attract the attention of the prisoner, and then with patient slowness drew back the heavy bolt. The metallic creak seemed to run, a thread of penetrating sound, down the corridor; but Laurente persevered till the heavy door swung open. He whispered his comrade's name, and the next instant felt himself grasped by the hot and nervous hands of the Corsican. For a space the two lads stood listening.

'Why did you come?' asked Napolione at last.

'I thought,' said the other, a little chilled by the question, 'you would be lonely.'

'No; I have my thoughts for company;' and he laughed softly and oddly.

'They are treating you shamefully,' said Laurente; 'and why? Because you are a Corsican.'

'Yes; and you because you are English. I hate these French,' he added in a fierce whisper, 'and I will do them all the harm I can.'

'Will they let you go to Paris?'

'They do not want to keep me here, and the others hate me only the more because M. de Keralio declared I should be one of the first to go. But I *shall* go,' he said with energy. 'It is fate. They cannot stop me. I love Corsica, and sometimes I picture myself there. But Paris is the field! Paris is the world!'

The darkness seemed to thaw his reticence, and the Corsican lad went on to talk of his dreams—talking more to himself, indeed, than to the English lad listening.

He used broken phrases, as if half-reluctant to talk of his ambitions and hopes—hopes and ambitions extravagant enough for a lad sitting in the darkness of a punishment-cell, but which were destined to fall far short of the amazing reality. Presently he stopped, and silence fell on the two lads.

'Get back, Jean,' the Corsican at last whispered. 'The Fathers have quick ears. If they found you here it would be worse for me;' and he pushed the other lad out, saying, 'I will take no risk. I won't give them any new excuse for injuring me.'

Jean felt sore at being dismissed in this abrupt fashion; but the stronger will of his comrade prevailed. He slowly and carefully worked back the bolt into its socket, and then made his way through the darkness to his own room.

As he went his foot struck against some rustling object on the floor. He stooped and picked it up. It was a book; and, holding it in his hand, he went on his way. A deeper shadow seemed to lie within the doorway of his room as he came near it, and the boy hesitated before he stepped into its darkness.

While he still paused a strong hand seized him, and Father Leyrault's voice demanded sternly, 'Where have you been? Why are you out of your room?'

Jean hesitated. To tell would injure Napolione.

'I have been down the corridor,' he said sullenly.

'But where? Who was your comrade? Into whose room have you been?'

The English lad was obstinately silent. The angry Father shook him furiously, but he could shake no answer out of the boy's stubborn lips.

'This will be inquired into in the morning,' he said at last; 'then everything must come out;' and he locked the door with angry emphasis, leaving the lad a prisoner.

In the morning Jean listened with disquieted ears to the familiar sound of the awakening school, the clang of the bell that called the lads to morning service in the school chapel, the tramp of their feet as they passed along the corridor. Presently, and much sooner than he expected, came the sound of returning feet. A note of unusual excitement was in the boys' voices as they went past. A little later the door of the room opened, and Father Berton and Father Leyrault entered. They looked at the lad with a silent and questioning sternness, at which Jean's heart, in spite of himself, sank.

'Your wicked crime is known,' began Father Berton.

Jean stared with uncomprehending eyes.

'You come,' said the monk, 'of a heretic race; but even a heretic might have shrunk from a deed so blasphemous;' and the two monks crossed themselves piously.

'What have I done?' asked Jean in awe-stricken accents.

'You know,' replied Father Berton curtly, 'and so do we;' and with an imperious gesture he led the astonished boy from the room. They took him along the corridor, and thrust him without further explanation into the room which served as a prison, where Napolione sat.

Here Jean learned the details of the crime of which he was accused. Two figures, one of Benedict Nursia, the founder of the Order, and one of Benedict of Aniane, its restorer, stood on either side of the door of the school chapel. In the night some wicked hands had wrought a strange transformation in the appearance of the two saints. A cocked hat set at a rakish angle had taken the place of the nimbus on the head of the elder Benedict; a fierce moustache adorned his lip; an old musket was substituted for the cross in his hands. The

ascetic of the fifth century was transformed into a drunken-looking grenadier of the eighteenth century. The twin figure of the restorer of the Order had undergone a still more astonishing restoration. His saintly, if wooden, face was painted into the resemblance of a clown. A wooden pipe was thrust into his mouth; a ragged coat hung over his shoulders.

Father Bibron, who opened the door of the chapel, was old and unobservant, and had failed to discover the sacrilegious act; but the procession of lads, as they came to the chapel door, saw it. They even seemed to look for it; and a hundred grinning faces and delighted gestures greeted the strange spectacle offered by the two ill-used saints. So great was the excitement that the cadets had at last been ordered back to their rooms. Here was an act of the blackest sacrilege, and, in monkish logic, who could be the guilty author of it but the English lad?

Jean told Napolione how he had been detected by Father Leyrault on returning to his room.

'That will convict you,' said the other lad with curious indifference.

Jean went on to describe the two figures he had dimly seen on the stairs, and how one resembled Chambon. On his way back to his room he had picked up a school-book, in which, when he examined it, he found Chambon's name written. As he listened the dark face of the Corsican lad flushed, his eyes grew eager.

'Tell that to the Fathers. It will ruin him.'

'But I am not sure that it was Chambon I saw; and perhaps he dropped the book in the corridor as he went to his room.'

'But say it was Chambon, whether you are sure or not. Why should you spare him? It is a chance against your enemy.'

It was the Corsican blood in Napolione that was speaking.

'I could not,' said Jean obstinately; 'it would be mean to tell.'

'It is always right to stab an enemy,' replied Napolione, with the fierce ethics natural to his blood. 'Tell the story,' he went on vehemently; 'it is your chance to destroy him.'

But Jean shook his head obstinately. It was not merely the schoolboy's instinctive dislike to 'tell' which restrained him. There was unconsciously a deeper feeling behind that shake of his head. The touch of a dead mother's hand kept his conscience tender, and he would not lie either to escape an injury or to revenge a wrong. His companion looked at him with scornful eyes. He plainly thought it was weakness to hesitate, and he despised the English lad for the weakness. The two lads, in a word, represented unlike schools of thought, and were governed by different ideals.

'To let an enemy escape when you can destroy him,' said the Corsican fiercely, 'is folly.'

Jean's obstinate silence increased his wrath.

'You are stupid,' Napolione went on, with cold distinctness, as though closing the incident, and explaining it. 'You cannot learn. You will never make an officer. You must keep a shop.'

Yes, poor Jean's 'stupidity' was a byword at Brienne; and the English lad himself neither doubted the fact nor resented it. The nimble-witted French boys, who beat him in every lesson, made him their constant butt, a process which Jean bore with stubborn and unresisting patience. A slow stubbornness, indeed, was his characteristic. His very anger, when kindled, was of the slow but unquenchable sort. When once kindled, however, it outlasted the effervescing resentments of the other lads, and made him, at least, a fighter to be dreaded. His stubbornness extended to his memory. He did not learn quickly, but what he once learned he never forgot; and wiser teachers than the Fathers at Brienne might have seen in that circumstance some gleam of promise. He had, moreover, a dogged and undiplomatic honesty. He could not lie adroitly, or, for the matter of that, lie at all.

An unpopular youth, he had only one friend—the Corsican, and he endured poor Jean's affection rather than returned it. And now the English lad's one friend had turned upon him.

(To be continued.)

THE GATHERING AND DISTRIBUTION OF NEWS.

IT has been truly remarked that the telegraph, reinforced by the telephone, supplies the news which now forms the backbone of the daily paper. Newspaper methods have been revolutionised by their agency, and it is not difficult to remember when the average daily might have but a slender column or so of telegraphed news, as compared now with a daily average of thirty or forty columns. This may cost the daily paper anything from ten thousand pounds a year upwards. The amount of material telegraphed is on an ascending scale. In 1871 the number of words handed in for transmission was twenty-two millions, which had increased to eight hundred and thirty-five millions in 1900. But lately the Postmaster-General (Mr Buxton) complained in the House of Commons that the loss on press telegrams was about a quarter of a million sterling annually. These are sent at a specially cheap rate.

Fresh, first-hand news commands a high price, and the journal with most of it scores. The multiplication and rapid sale of the halfpenny evening paper, in many editions, show how greedy the public is for the very latest news. No paper could exist for a day unless it met this demand for news,

received, it may be, through its own independent channels at great expense, as well as flowing in from news agencies at home and abroad, which have developed alongside the growth of the newspaper press. And amongst the more important of these agencies for gathering and distributing news, about which we set down some information, are Reuter's Telegram Company, Press Association, and Central News; only mentioning Marconi's Wireless, Dalziel, Laffan, Havas, and the Associated Press Agency of the United States. These gather and transmit news to feed the omnivorous maw of the daily press.

The reader may notice without comprehending its meaning the word 'Reuter' at the tail-end of an important message from thousands of miles away regarding a public calamity, revolution, earthquake, or the death or serious illness of some notable person. For instance, the death of General Gordon, or that of R. L. Stevenson sent by Reuter from Samoa, started thousands of pens a-scribbling, as did also the announcement of the birth of an heir to the Spanish throne. We get the news and think nothing of the medium of transmission, and have long ceased to wonder at the miracle of reading about events which happened a few hours before on the other side of the world. We accept the thing as a matter of course, as we do so much in modern life. What Puck proposed to do in putting a girdle round the earth in forty minutes is a daily achievement.

The single ambition to be true, according to M. de Blowitz, was the highest aim of an influential editor like Delane of the *Times*. This is more difficult to accomplish than may appear on the surface. However easy it may seem to the uninitiated, there is a right and a wrong way of dishing up news, of writing a paragraph, as well as in editing a newspaper. If the reader cares to make the experiment, let him try to write a short paragraph giving an item of news or the description of some incident, and he will find that he may have overstated or understated the matter, and may completely miss the point. It is not so easy to be true, as any one knows who listens to average conversation, which if printed and published to the world would set many folks by the ears and keep the law-courts busy.

Lord Cockburn notes in his *Journal*, as a great feat, what the *Times* did in reporting the speeches at the dinner in Edinburgh to Earl Grey in 1834. Special reporters came down from London, left Edinburgh at twelve P.M. on Monday, 15th September, and at one o'clock on the afternoon of Friday the 19th the *Times* reached Edinburgh by the mail with a full account of the proceedings. Post-horses, macadam roads, shorthand, and steam printing, Cockburn remarks, never did more. The reporters had posted up to London in thirty hours, arriving on Wednesday morning at six o'clock. The paper was thrown off that forenoon, and left London for Edinburgh by the mail that evening. Express trains and the telegraph enable the inhabitants of Edinburgh to read such a speech, so delivered, in the London dailies by the following afternoon, while the local dailies make it possible to discuss the points of the speech at the breakfast-table. Charles Dickens once recalled the old methods of gathering news for the *Morning Chronicle*, and mentioned that he had been in his time upset in almost every description of vehicle, belated on miry byroads towards the small hours, forty or fifty miles from London, in a wheelless carriage, with exhausted horses, and got back in time for publication. Even earlier in the thirties and forties intelligence of important events was brought into London by mounted horsemen. A pace of twelve miles an hour was thought very quick indeed.

Sir John R. Robinson of the *Daily News* was a pioneer in the art of sending newspaper correspondence from special correspondents over the telegraph wires. It had not, apparently, occurred to any one before 1870 that letters by telegram from France or Germany could hardly be more expensive than the old expresses, which cost so much in the pre-telegraph days. Editors were getting into the habit of relying almost exclusively upon Reuter for their foreign intelligence. When Robinson chartered Archibald Forbes as war-correspondent of the *Daily News*, a great hit was made by having his correspondence from the seat of war wired to the London office. In the Franco-German war, and later in the Russo-Turkish war and in South Africa, wonderful feats were performed in the way of gathering and transmitting news. After being in the saddle all day where the fight was fiercest, Forbes would ride all night to some place whence he could despatch his message. Forbes said that only exceptional men were fitted for the life of a war-correspondent. He was exceptional, and was decorated with fourteen medals or crosses. In the war between Japan and Russia the correspondent had by no means such a free hand, and thousands of pounds were spent by the press in sending out correspondents who never properly fulfilled their mission.

It was the power of the telegram which made M. de Blowitz, who was a born journalist, such an acquisition to the *Times*. Laurence Oliphant, while *Times* correspondent in Paris, asked M. de Blowitz to draw up a note regarding an interview with M. Thiers, about which Oliphant said, 'A genuine hit. There is not a word to alter in it. You are a born journalist.' It was telegraphed to London; and the clever Paris journalist, in walking along the Boulevards the following afternoon, bought a French newspaper, and therein read the telegram sent the previous night to the *Times*. 'I experienced,' he says, 'one of the strongest emotions I ever felt in my life. The power of the telegram in its connection with journalism flashed upon me at that moment, and I felt I could turn it to account.'

Any telegram received through the medium of Reuter may be looked on as reliable. The founder

of Reuter's Telegram Company was Baron Julius Reuter, an Englishman by adoption, who was born at Hesse Cassel in 1816. He was trained to business life in the office of an uncle, and early became interested in the electric telegraph and in the opening of a circuit between Berlin and Aix-la-Chapelle in 1849. He saw his opportunity, and opened an office in Aix-la-Chapelle, the first for collecting and transmitting news by telegraph. The early problem was to establish communication with places not already connected by telegraph. This was done by preparing news in the railway train and sending it by carrier pigeon; and amongst his early successes was that of getting pigeons to cover the distance between Aix-la-Chapelle and Brussels in an hour, beating the mail-train by several hours. Three birds were employed for each message in case of delay. A break in the wire between Paris and Berlin was once surmounted by means of relays of horses.

The censorship and vexatious laws bearing on the Continental press led Reuter to decide to come to Great Britain. He sold his Aix-la-Chapelle business in 1851, and opened an office in London at Royal Exchange. Sir John R. Robinson has left rather an amusing account of how Reuter set about capturing the London editors. Fleet Street at first looked askance at the project, and managing editors were not anxious that the control of their news should be in private hands. 'Mr Reuter,' says Robinson, 'was a most plausible man, but it was in vain that he broached his project in one office after another. He was not to be daunted. If he could not get any promises of support, he would begin operations without them. Accordingly he arranged with correspondents in all the principal capitals of Europe, and when his messages began to come in he took them round to the newspapers and offered them for nothing, the only condition being that his name should be associated with them. "Try them," he said in his most insinuating way, "for vun month; if they do not answer, vy, it signify nothing." At last one paper tried them, then a second and third, and so on until at length all were in the net; and the little man danced about the City, his face full of glee. On calling and finding his messages gave satisfaction, he came to business: "Of course you must know that the expense to me is very great. If I am to continue I must ask you for a *leetle* subscription." The demand was complied with; and gradually all telegrams, such as they were at that time (just after the Crimean war), were practically abandoned, and for many years from Reuter's office proceeded nearly all the messages from foreign countries that were given to the world.'

Reuter's first efforts in London were for the circulation of commercial intelligence. About 1858 a scheme he submitted to the *Times* was declined; he turned to the *Morning Advertiser*, which was then paying forty pounds a month for its foreign telegrams. Reuter offered to improve on this service at thirty pounds a month. The *Advertiser* closed with this offer, and six other London papers, including the *Times*, became his clients. This was the turning-point of his enterprise, which has been characterised throughout by accuracy, completeness, and rapidity of transmission and distribution. Before the laying of the Atlantic cable, Reuter arranged that his agent should meet the American mail-steamers off the coast of Ireland by a fast-sailing yacht. News despatches were packed in hermetically sealed boxes, which were thrown on board the yacht from the mail-boats, and forthwith carried to Crookhaven, on the Irish coast, from whence the news was telegraphed *vid* Cork over some sixty miles of wire which was laid by the indefatigable agent for news, for quicker despatch to London. Reuter gave the first news of the death of Lincoln after he was shot, news of the *Trent* affair, and the calamity at Isandula. As has been said, 'its agency is ubiquitous, and neither oceans nor mountain-ranges, deserts nor forests, can divert its activity or thwart its purpose.' No event of any moment escapes its observation. There are branches or agencies in every important city in Europe, in North and South America, Australia, India, China, Japan, Africa, and East and West Indies. Reuter turned his business into a company in 1865, and remained its managing director until 1878. His elder son, Mr Herbert de Reuter, now Baron de Reuter, was his successor; and his second son, Baron George de Reuter, has also a seat on the board of directors. The founder of this great concern died at Nice in 1899.

Reuter is fully equipped for anything that may happen in India, with branches at Bombay, Calcutta, Madras, Colombo, Rangoon, Karachi, and Cawnpore. When war breaks out, Reuter must keep one or more correspondents on the spot to send on news. Quite a number were so engaged during the war between Russia and Japan, and the company's prestige as a distributor of news stands as high in Japan and China as in Europe. Reuter gave to the world the Ameer's speech after his visit to India. Reuter's agents in China are closely watchful of the intellectual upheaval taking place there. Lord Cromer's farewell speech in Egypt, containing several thousands of words, one of the longest and one of the most informing messages ever despatched by Reuter, was transmitted in little over four hours. A code which cost some thousands of pounds, the result of three years of hard work, and which contains half a million phrases, is now available.

The Press Association—the largest of the various news agencies operating exclusively in the United Kingdom—was founded by the owners of the provincial newspapers in 1868 to meet the situation created by the Telegraph Act of that year, by which the Government was authorised to acquire the telegraphs hitherto owned by private companies. The latter gathered press matter in addition to transmitting it; but this dual system had then to cease —

hence the inception of the Press Association for the purpose of organising the collection of news on a more satisfactory and complete basis.

The Association commenced its labours simultaneously with the taking over of the telegraphs by the State on February 5, 1870, and ever since its career has been one of increasing usefulness and prosperity. Established as it is on strictly co-operative principles, its shares are held by the provincial newspapers alone, and each member can possess only a certain number according as the paper is a morning, evening, or weekly publication. But though debarred from the privilege of membership, the London papers are, and always have been, very large customers.

The original capital was nominally eighteen thousand pounds, of which less than half was actually paid up; but, owing to the remarkable growth of the business, it was decided three years ago to increase the nominal capital to one hundred thousand pounds, and the paid-up capital to fifty thousand pounds, the latter being effected without any call whatever on the members, by utilising the savings of the thirty-four years in order to give three additional fully paid-up shares for each one then held.

The company's affairs are directed by a committee of management, each member of which serves for a term of five years, and the election of one new member every year ensures the regular infusion of 'new blood.' A consultative board, consisting of the same number of members (five), all of whom have usually served on the committee of management, meets twice a year in conjunction with the committee.

At the outset of its career the Press Association entered into an agreement with the world-famed Reuter's Agency for the monopoly in the United Kingdom outside the Metropolis of that organisation's foreign news; and the alliance has been maintained and developed in a variety of ways. One of the outcomes of this close working is the supply of supplementary telegrams of specially interesting events, which in London are read as 'Reuter's Special Service,' and in the provincial journals as 'Press Association Special Service' or 'P.A. Foreign Special,' the matter being identical.

The Press Association, besides a large headquarters staff, has special staffs for parliamentary, law courts, racing, cricket, and football, and Stock Exchange and commercial intelligence; and it utilises the services of over thirteen hundred duly accredited correspondents throughout the country, besides innumerable occasional correspondents.

The chief offices at 14 New Bridge Street, E.C., are never closed, a staff of sub-editors being always on duty to deal with the mass of 'copy' that is continually being received. The largest individual item in its accounts is the sum paid the Post-Office for the telegraphic transmission of its news. This amounts to about one thousand pounds a week, which makes the Association easily the largest single customer possessed by the State.

In its news services, which are classified so as to meet the wants of the wealthiest paper down to the requirements of the smallest weekly publication, the P.A., as it is familiarly called, aims at supplying matter of general importance with the utmost accuracy and speed, while it also undertakes to watch the local interests of the provincial papers. It has special wires to the General Post-Office for the reception and transmission of its telegrams, a special wire from the House of Commons to the head office as well as to the General Post-Office, and other private wires and innumerable telephones. A great feature of its supplies is in the verbatim and summary reports of public men, for which work the Association deservedly enjoys a high reputation.

During the last three or four years telephony has been more and more utilised by the Press Association for the distribution of racing, cricket, football, and general news; and its telephonic services represent the highest and most up-to-date development in the increasingly rapid—one might almost say practically instantaneous—dissemination of matter.

The late Mr John Lovell, a well-known journalist and afterwards editor of the *Liverpool Mercury*, was the first manager of the Association, and on his resignation in 1880 was succeeded by the present manager. Mr Edmund Robbins, who had joined the staff as a sub-editor prior to its commencing operations, and who in 1874 had been made secretary and assistant manager.

The Exchange Telegraph Company's system of transmission of news locally in the Metropolis by means of tape and column printing instruments is well known in London. Hotels, clubs, bankers, and stockbrokers avail themselves of the system, as well as the newspapers. The company has two distributing stations, one at 17 Cornhill and the other at 64 Haymarket. There are a thousand receiving instruments connected with the two stations, two hundred in newspaper offices between Temple Bar and Ludgate Circus. It has a system of agencies for the collection of news in town and country, and supplies Reuter's and the Press Association with instruments for the distribution of news to subscribers. The ingenious instruments, which print messages in bold type on a tape continuously or in column, are the invention of Mr F. Higgins, the chief engineer of the company.

The Central News Agency has over eighty agencies for collecting and transmitting news, all subsidiary to London. In the United Kingdom the agency has correspondents in every town and village of importance. A staff of something like twelve hundred men gather the news and transmit it to the head office, where a process of weeding out or strict editorial control is exercised over it. The amount sent in from the various correspondents in

one day would, it is said, be sufficient to fill a three-volume novel. Only a certain amount of this is marketable.

The system of gathering and distributing news may be of the most perfect kind, but if the distribution of the finished product be not equally good all that is gained may be lost. Mr C. A. Cooper, late editor of the *Scotsman*, in his *Editor's Retrospect*, says that newspaper managers must be restless, and go from one effort to another, and in this connection pays a high compliment to Mr James Law, the business manager, a pioneer in securing special wires, special trains for early delivery of papers, and special correspondence printed under the heading of 'From Private Correspondence.' Mr Law travelled over the whole of Scotland, corresponded with every railway company, and made it possible for his newspaper to reach the remotest village or town at the earliest time. Newspaper railway parcels came to be carried by contract. The opening of the Press Gallery in the House of Commons to provincial reporters was another advance. As a result of these efforts a dweller in Fort-William, one hundred and forty miles from Edinburgh, can have his daily paper by ten A.M. Mr Cooper gives Mr Law the credit of being the head and front, the brain and eye, of the movements which since 1860 have brought about a complete revolution in the press of Great Britain.

DICK HELLIFIELD'S DOUBLE.

CHAPTER II.

AHMED reported on the evening of the day but one following that the man of the red fez had not come in by the train from Ismailia. It made no difference to Dick. He was apparently careless whether the man came or not. Ahmed, as I could see, was more concerned for his master than his master was for himself.

Dick had not yet volunteered to give me any information, and I had refrained from asking him. He would tell me when he was ready, not before. He showed me the sights in and around Cairo. In those early days of my winter sojourn we did not go far afield. I was not very fit for it, and Dick did not wish to tire me. Wherever we went Ahmed went with us—at a respectful distance where the ground was open and there were few people about, but in the bazaars and through the more frequented streets as near and as faithful as Dick's own shadow.

One morning we rambled westward, across the bridge flanked by the bronze lions and through the shady avenues, until we reached the new museum. We passed in, more for the sake of the coolness and a rest than with any intention of inspecting the mummies. Strolling forward, we found ourselves eventually in the spacious room where the rare discoveries from the Valley of the Tombs of the Kings are deposited, conspicuous among them, and most important, the mummy of the wonderful Sesostris, as the Greeks called him, the second Rameses, the great builder, the mighty warrior, the supposed oppressor of the Hebrews. Wrapped in faded cerements and enclosed in a crystal case, there he lay at full length for any one to gaze upon unabashed, smiling with pity even, although in his own day the people had trembled at his nod and worshipped him as the enshrinement of the Deity. There was nothing Egyptian in the lineaments of that attenuated face, with its narrow brow and prominent cheek-bones and aquiline nose (slightly crushed at the tip where the bandages had pressed it) and determined chin—the counterpart of the gigantic statues far away up the Nile. Rather was it Syrian than Egyptian, proclaiming his affinity with the race he had oppressed, and a possible strain in him of the displaced Shepherd Kings. A tall, gaunt man was he, well stricken in years, and with the hair still clinging to the back of the parchment-like skin, which had closed in with the wasting tissue over the long skull. In full view of him, with Ahmed waiting in the doorway, we sat for a long time speechless, until at last Dick found his tongue.

'Poor beggar!' said he, as if in a reverie. 'It all went for nothing.'

'What went for nothing, Dick?' and I turned, and noticed—what I had often noticed before—the peculiar dreamy look in Dick's gray eyes.

Practical though he was for the most part, and though he had devoted his life to a practical calling—that of an engineer—there was a look in Dick's eyes sometimes that almost startled one, an uncanny look, as if he could see things invisible to others; and the look was there now. Since my arrival I had observed people turn from him, when he glanced at them, with a slight expression of fear. They evidently thought he could see too much or too far. Steady orbs of clear gray, with a sense of mystery swimming in the depths of them, are not attractive to the Oriental. Ahmed was never disconcerted by them, but Ahmed was an exception; he had had an opportunity of proving the worth of the man who owned them.

'The careful embalming, and the secret burial, and the attempt to keep the body intact until the spirit, the double, the *ka*, or whatever else you care to call it, came to resuscitate him,' said Dick, in reply to my question. 'Thrice since they walled him up in his rocky burial-place in the mountains have the cycles passed the point of the double's return, but he has never moved.'

'And never will,' I added, with a smile. 'It

wouldn't be worth while;' and I nodded towards the shrunken body reposing in the glass case. 'He would cut a sorry figure now if he were to revive and take it into his head to stalk into Cairo.'

'No more sorry a figure than Cairo itself would cut in his eyes in comparison with the City of the Sun of his own day. Degenerate himself, Jim, he would come back to a no less degenerate Egypt. But you are a sceptic. You don't believe in the double.'

'Not I. Do you?' for Dick was speaking seriously.

'Yes,' answered Dick simply, causing me to stare at him as if he were demented; 'not in the return of the double, but in its existence. The old Egyptian priests had got hold of the tag-end of a truth when they spoke about the *ka*. A desire for immortality supplied the rest.'

'Dick, do you know what you are talking about?'

'Perfectly. I've gone into the thing, and I tell you that the residuum of truth in the belief of the ancient Egyptians was their teaching about the double. If there is a natural body, there is also a spiritual; so St Paul says, echoing the Egyptian priests, for I take it that by the spiritual he meant the double of the natural—its counterpart. I didn't care a brass farthing about it, one way or the other, until it was brought home to me; and, mind you, Jim, I don't pretend to understand it now. I only know that the double exists, and I leave it there.'

'You know! How do you know?' for I was amazed to hear Dick talking in this fashion. 'How was it brought home to you?'

'Well, I'll tell you, and it will lead on to something else I want to say about the dastardly fellow who shot at me in Port Said. You remember the railway accident at Dryclough Junction about five years ago?'

'Yes,' said I, wondering what that had to do with it. It was an unexpected twist in the conversation, and a long leap from the shrivelled mummy of Sesostris to a modern railway smash of only five years ago. Then a recollection came to me suddenly, and I added, 'You were travelling by that train, Dick—yes, I remember—and you had a narrow escape.'

'Very narrow. And I had a strange experience which I have never mentioned to any one from that time until now. I was the only occupant of the compartment. In my hands was an open newspaper, the *Standard*, spread out to its full size, so that my face was hidden, and I was reading one of the leading articles, when, after we had been swinging along quite easily, say at forty miles an hour, the jar came. Lowering my paper, I saw, sitting opposite me—myself. Every detail—down to the paper, and the way I was holding it, with the name *Standard* printed on the title-page—was reproduced, just as if I had been looking at my own reflection in a mirror. But there was no mirror; the exact counterpart of myself, my own double, was looking me squarely in the eyes. I was not startled, and I had no time to wonder. The jar was succeeded by another and another, as rapidly as they could come—caused, I suppose, by the carriage bouncing over the sleepers—and followed instantly by crunching woodwork and splintering glass; then, and again instantly (for it was all compressed into a few seconds), there was a sickening thud, the roof of the carriage was rent asunder, and I was pitched headforemost through the gap. As if by a miracle, I alighted on the embankment unhurt, clear of the débris, and rolled to the bottom, where I picked myself up and began at once to render assistance to the sufferers. You know what had happened. The piston-rod of the engine had snapped, and the details of the catastrophe you would read about at the time.'

'Are you sure you were alone?'

'Quite.'

'Didn't the shock, think you, play a trick with your memory?'

'No.'

'Then it was a pure hallucination, a simulacrum of yourself, produced by your startled brain when the first shock came.'

'I was not startled. My brain was as clear and as calm as it is now. Without seeking for any cause like that you have now mentioned, but perfectly sure that my brain was in its normal state, I nevertheless said to myself that it *was* a pure hallucination, and therefore I mentioned it to no one. When I began to consider the vision—if we may call it so—or the appearance of the double, it impressed me rather seriously, and I refrained from mentioning it partly because I had no desire to be laughed at. Even you, Jim—and you're not one of the cackling sort—might have laughed at me if I had told you sooner or in some other place than this;' and he waved his hand to include the whole of the royal and priestly mummies arranged along the room.

'No, I don't think I should. But the phenomenon is explainable.'

'Is it? I should like to hear it explained.'

'But surely, Dick, you don't believe the appearance was real?'

'I do,' said Dick stoutly; 'as real as you are sitting beside me now.'

'And as palpable?'

'Well, I cannot answer for that. I have never offered to shake hands with my double. It may have been a lack of courtesy on my part. I have had no time to think of courtesies. But so far as my sight is concerned—and they say seeing's believing—the appearances have been real enough.'

'The appearances!' said I, more amazed than ever. 'Have you seen yourself again?'

'Twice since the railway smash, and these have confirmed my impression that what I saw then was real. If the experience had not been repeated I should have persuaded myself in time that the

vision in the railway carriage was a vision only, and purely subjective, something which had happened not outside me but in my own consciousness. I do not think so now.'

'Twice, do you say? Where?'

'Here in Egypt—once in a little village on the eastern side of the barrage, and again on the balcony of the Hôtel d'Angleterre in Port Said where you and I were sitting together a few nights ago.'

'I saw nothing.'

'That may be. Your chair was not turned in the right direction. But my double appeared when the shot was fired; not simultaneously with the firing of the shot, but almost—only the fraction of a second before.'

'Stop, Dick!' said I, for I was beginning to be convinced against my own reason. 'Let me think.'

'Think away.'

'Immediately before the shot was fired you suddenly sat up and passed your hand across your brow.'

'I forget about the sitting up—I suppose I must have done so—but I remember passing my hand across my brow. It is a trick of mine, and I was the least bit dazed. You see, my double was seated at the other end of the balcony.'

'When did the double disappear?'

'With the burial of the bullet in the woodwork over my head.'

'It is strange—very strange. And the appearance in the little village on the Nile—what about that?'

'It came to warn me, like the others. I was in imminent danger. It is a friendly double, Jim, and has never appeared except when I have been within an ace of losing my life. That is something to go upon, if you are interested enough to spin out an explanation that will cover the facts. Another item which you shouldn't leave out is that the appearances are momentary. They never last. I have never been conscious of any excitement. All the three times I have been as calm as I am now, and as sane, so far as I know. The only sensation I have had is the one I referred to just now—a slightly dazed feeling which has passed away with the evanishment of the double.'

'Haven't you formed some theory of your own, Dick, to account for it?'

'No; I have simply accepted it.'

'Well, it beats me,' said I after a long pause, during which I was turning the thing over in my mind. 'But about the appearance in the village—what are the details?'

'Haven't we been here long enough, Jim?'

'Perhaps. But I should like to hear the details of that second appearance. I understand they are connected with the man who followed you to Port Said.'

'Yes, and who will follow me to Cairo. He may be in Cairo now. I expected him to turn up before this. But we shall not be back in time for luncheon if I begin to tell you that story, and luncheon is a necessity for you. You'll take a lot of building up, Jim;' and he glanced at my rather wasted form. 'Now, for me luncheon will be a convenience—shall I say an acceptable convenience?—judging by sundry responses which the thought of it has called up; for neither the appearances of the double nor the designs of my follower have affected my appetite.—Ahmed, call a carriage.'

Ahmed disappeared from the doorway, where he had waited motionless, occupied with his own thoughts, all this time; and as we came down the outer stairs and crossed the small garden the carriage was waiting for us at the gates.

We bowled along through the avenues and towards the bridge across the Nile. The wide river was rolling its silt-charged waters smoothly and evenly towards the Delta. The depth and force of it were disguised by the placidity of its surface. On its eastern bank the high masts and long, tapering yards of the dahabeeahs made an intricate lacework pattern in sombre browns against the faded yellows of the buildings and the intense blue of the sky. In patches and short lines from the midst of the buildings, and shooting up into the sunlight, were the feathery green tufts of the stately palms. Here and there—above and below the bridge, but mostly below—dahabeeahs deeply laden skimmed across the river like birds with gigantic wings. The bridge was crowded on either side with foot-passengers, two human streams setting inward and outward, brushing softly past each other, and forming where the tide was fullest into tiny eddies ere they disengaged themselves and were silently swept along. For it was a silent crowd, soft-footed, ungreeting, with none of the clatter which distinguishes a crowd in the West. Vehicles were few, and they moved with little noise. Tall, gaunt camels stalked along the roadway, waving their necks and placing their sponge-like feet down carefully, as often as not led by a gray ass, sober and meditative, and ridiculously small by contrast with its string of ungainly companions. A moment's flurry was caused by the gaily attired outrunners of a closed carriage, clearing the way with wands and uttering short, subdued cries. The carriage came on, drawn by a pair of superb bays. Through the open window, as it passed by, we caught sight of a lady's face barely concealed by a white *yashmak*. She was bending slightly forward, with a beaming smile, apparently answering two chattering children seated on the opposite side of the carriage, else we should not have seen her face at all.

'A pretty glimpse, Dick,' said I as we whirled past, and, emerging from the bridge, entered the square by the Khedive's palace. 'The children seemed very happy, and so did she.'

'From there probably,' answered Dick, jerking his thumb towards the long façade of the building. 'Yes, it was like a peep into an interior—as much as one gets in this land of secret domesticity. She was very beautiful.'

'Very; quite a picture.—Hallo! what is it,

Ahmed?' for, seated beside the driver, Ahmed had half-turned, and was quietly calling our attention to some one or something across the square. Dick had not observed the movement.

'You see him, Mis'r 'El'field?'

'Where?' asked Dick, following the direction of the nod. 'Oh yes, I see him, Ahmed. Thank you.'

'Whom, Dick? The man in the red fez?'

'There are hundreds in a red fez. But you are right, Jim. This is the particular one.'

'Has he seen you?'

'Not yet. If he does he'll follow us to the Esbekieh. Don't look round, Jim,' he added as we left the square. 'His eyes are as sharp as needles. Not that it matters much, for he's sure to find us sooner or later. Ahmed will have to be a trifle more cautious—that's all.'

'And you, Jim?'

'Oh, Ahmed looks after me.'

As we alighted from the carriage at the door of the hotel I instinctively turned my eyes along the road which skirted the gardens, the road by which we had come. Round the corner, under the trees, a man bounded, and stopped dead when he saw the carriage. He was dressed in black and wore a red fez.

(To be continued.)

NAPLES AND PALERMO,

THE TWO GREAT CITIES OF SOUTHERN ITALY.

By George Pignatorre.

NAPLES and Palermo, the twin capitals of the former kingdom of the Two Sicilies—so alike in some aspects, so unlike in others, but each preserving its own individuality—are far from being placed on a par; Naples being by common consent in the first rank (to which perhaps her size, population, and surroundings may entitle her), and Palermo being relegated tacitly to the very subordinate rank of an ordinary provincial town. This greater renown of the Siren City over its Sicilian rival is due to several causes: to the able pens and brushes which have depicted her in glowing colours, and to the glamour of the ancient cities restored to the light of day after more than a millennium and a half; to the stirring events which marked the foundation of the short-lived and ill-fated Parthenopean Republic in 1799, of which Naples was the head and the soul, and which are so intimately connected with the glorious name of Lord Nelson and the questionable one of Lady Hamilton; lastly, to the greater proximity of Naples to the usual route followed by tourists in bygone days, and the comparative inaccessibility of Palermo up to within the last thirty years—that is, ere swift steamers and through trains had linked the two cities together.

Of Naples so many have sung the praises in prose and verse that there is little left to relate or describe. All that remains is the humbler task of commenting in plain prose on what is brilliantly told by others.

Greek and Roman, Goth and Byzantine, Norman and Teuton, finally French and Spaniard, have all wooed and won by turns the unreluctant Siren City. From the day when Belisarius stole into the city through the aqueduct in the first half of the sixth century after Christ to the year 1860, when Garibaldi drove in with a handful of followers, she has almost always welcomed or submitted tamely to her conquerors. The one single occasion on which a portion of the Neapolitan population opposed an armed resistance to the foe was in 1799, when the *lazzaroni* rose in defence of the Bourbon tyrant, and more especially of Saint Januarius, against the unbelieving French Republicans, while the enlightened few greeted them as liberators. Naples has produced many eminent men of letters and of action who have sacrificed life and freedom in their country's cause; but they have not been able to leaven the masses with their spirit, and it is more than probable that if left to themselves they might accept with equanimity a new rule. I do not mean by this to imply that the Neapolitans are unimprovable or have not improved, but that the process is a slow one, and that they have not had time to shake off the numbing influence of centuries of misrule and oppression.

Needless to say, therefore, that the Neapolitans of the twentieth century are the same unstable, impulsive, unreliable creatures they were in the seventeenth, when, after idolising Masaniello for five days, they forsook him on the sixth, and when he was done to death never raised a hand to save or to avenge him. These are national traits, and no amount of education can obliterate, though it can modify and neutralise, their effects. But even this has not been done; thus they continue to be the same identical brawlers, as prompt with their knives as the Romans, but less wantonly murderous, and extortionate in their dealings with foreigners to a degree certainly unsurpassed, perhaps hardly equalled, elsewhere. So convinced are they that foreigners are a lawful prize, of their own indefeasible right to fleece them to any extent, that they resent not only any attempt on the part of the stranger himself to avoid parting with his fleece, but also the conduct of those among their own people who may think otherwise, as a bad example. For instance, I have hardly ever been thanked when I have given a fee to a Neapolitan, though I have often been asked

for something more; indeed, the usual reply of the Neapolitan on receiving the extra tip is, '*Poco, signore*' —that is, 'Very little, sir'—instead of the prompt, '*Grazie, signore*,' you are accustomed to in other towns of Italy. Strangers will act wisely in being very chary of their vails, which they may, moreover, have given already, unknown to themselves, in paying double the usual charge for a fare.

Like other 'tender-foots,' I had to pay for my lack of experience in the shape of gratuities grudgingly accepted by the recipients, in overcharges, and in misspent charity. I now steer clear of all these shoals by bargaining for a reduction of fare or price, or by paying what is proper in either case, and, finally, by abstaining on principle from giving alms to vagrants and vagabonds who neither deserve nor are grateful for any dole of yours. The few really *bonâ-fide* beggars are also so attached to a life which is far less hard to endure in sunny Naples than in foggy London, and leaves them to the enjoyment of doing nothing (*dolce far niente*), that they sometimes refuse relief when accompanied by restrictions. Besides these more or less open and tolerated methods of relieving you of superfluous cash, which, if not strictly honest, are perfectly lawful, there is the very expeditious and perilous art of the pickpockets and street-thieves, which is nowhere practised on a larger scale than in Naples, and against which experience is powerless. These gentlemen, who have succeeded and have superseded the old footpads and highwaymen, have acquired a well-merited reputation for skill and daring, for their nimbleness of fingers is only equalled by their swiftness of foot, and both are unsurpassed. So bold have they become that persons have had their watches snatched by these light-fingered gentry in the most-frequented quarters, the thief disappearing up some narrow, dark lane close at hand, leading in its turn into one of those mazes of alleys which still exist, and where he is soon lost to view. These facts are so generally recognised by all that strangers entering a café are often obligingly warned by waiters not to expose to view any trinkets they may be wearing; even visitors stopping a passer-by to inquire their way receive the same warning. I was once advised by a chance-acquaintance whom I met in the Galleria Umberto I. on a sweltering summer day, and who had observed my watch-chain, to button up closely. 'Better lose a few ounces of flesh than your watch,' he remarked; and the remark decided me.

Apart from these nuisances, against which to be forewarned is in a measure to be forearmed, visitors have little to fear, for the smiling, amiable vagabonds you see will scarcely meddle with you if you do not meddle with them; in which respect, by the way, they resemble certain other wild animals. Contagious and infectious diseases are, I believe, rare, thanks to the vast improvements effected during the past thirty years through the agency of the Italian Government, or more properly by the municipality. The opening up of new quarters; the demolition in part of the old, which have been pierced by new wide thoroughfares; and the ample supply of pure water brought from the Serino springs, which is so cold as to cloud the glass when freshly poured out, and render iced-water superfluous, have one and all contributed to make Naples one of the healthiest, as it was one of the unhealthiest, cities of Italy. The Vomero is an especially breezy and salubrious resort for those who wish to take up their residence at Naples. It is reached by a steep funicular line, and so sheer is the ascent that the sensation you experience is like that of mounting a perpendicular shaft. One can travel back to the city on a tram-car, the cost of the whole transit being five soldi or twopence-half-penny, whereas if you engage a carriage and have a fair complexion the fare will be two or three lire.

Nor have the improvements done away with the picturesque, which meets the eye on every side in the quaint medieval churches, in some baronial palaces, in the frowning forts, Castel dell' Oro, Castel Nuovo, and Castel Saint Elmo, one and all connected with so many tragic episodes, real and legendary—all three dark, grim, and fearsome to look at. The picturesqueness and originality is still more marked in the gaudy colours and costumes of the people, in their bright popular songs, in the folklore. Indeed, this local colouring is not one of the least attractions of Naples; it is second only to the interest Capri, Baiæ, and Pompeii inspire as monuments and sites of old pagan splendour and wickedness, or to the burning mountain and the smiling coastline.

From the beauteous City of Saint Januarius we turn our gaze on the other great metropolis of the whilom kingdom of the Two Sicilies, the capital of the island-portion of the realm, as Naples was of the mainland—in a word, Palermo, which, with her three hundred and thirty thousand inhabitants, comes next to Naples among southern cities, and is the fifth in population of the whole kingdom. The old Phœnician settlement was always a thriving port, but was overshadowed by the great Greek colonies of Syracuse and Ægagas, until these perished or decayed, and the Saracens made Palermo the capital of their dominion in Sicily. Under the Normans and Aragonese kings Palermo rose to such pre-eminence that she was called, from her wealth, the City of the Golden Shell (*Dello Conca d'Oro*). The plains around were the best cultivated and fruitful in the whole island, and deserved the name of *Hortus Siciliæ* (Garden of Sicily). The Saracens and Normans have left many traces of their presence in the Oriental and Gothic architecture of palaces and churches. The most remarkable sacred building was founded by King William the Good, who certainly built the stately cathedral of Monreale (Mount Royal); for Sicily has had her two Norman Williams, like England, and Count Roger crossed the Strait of Messina about the same time that Count William crossed the English Channel. The struggle was long and fierce in both cases, and it was only in 1070

that Palermo fell into Norman hands. Henceforth she became pre-eminent over all southern cities, the seat of government of an independent or at least autonomous state, for home-rule lasted down to 1615. She did not share in the general decline of Italian towns, for even in Brydone's time (1770) her population was one hundred and fifty thousand souls, larger than that of most not only Italian but even European towns of the period; and, owing partly to this semi-independence and partly to the admixture of Norman and Saracen blood, the Palermitans have always shown themselves to be of sterner stuff than the effete Neapolitans, who have almost always bowed before the storm. Thus not even the all-powerful Spanish rule was able to enforce in its full rigour the Holy Inquisition. This most unholy institution was, it is true, introduced into Sicily, as into all the other dominions of His Most Catholic Majesty, to burn and rack the unconvinced; but certain checks were set to the religious zeal of its servants by the Palermitans through means that, if not orthodox, were very efficient and summary. The method adopted was peculiarly southern and national. An over-zealous officer of the dread tribunal was duly warned in writing, and if he continued obdurate he always quietly disappeared. 'Thus,' as Brydone says, 'the Inquisitors were taught becoming moderation.' And the Palermitans have often displayed the same spirit against the foreign invader as against the Spanish Inquisitor. They were also during the eighteenth century more advanced in social progress than the people of the mainland; and, among the nobility more especially, there were several families who not only were more liberal-minded and better instructed than those of other Continental countries, but could compare favourably even with English families. Brydone, speaking of the young girls, says: 'The young ladies here are easy, affable, and unaffected; and not, as on the Continent, perpetually stuck up by the sides of their mothers.' His praise of the noblemen with whom he came into frequent contact is equally unstinted; and to his mind the physical characteristics of the surrounding country stood very high —so high, indeed, that Palermo, in his opinion, excelled Naples in beauty and elegance.

If Palermo and the Palermitans have not maintained the lead they unquestionably held in 1770, owing partly perhaps to fortuitous circumstances, they are still well to the fore, and have not stood still. The city had not been, like Catania or Messina, razed to the ground by telluric convulsions or ruined and devastated like Rome; she was, therefore, never wholly or partly rebuilt as they were, but she was enlarged and beautified. The two long main streets cut each other at right angles, as they did in 1770, and divide the town into four well-marked regions; but they have been lengthened, and the interspaces filled with new, handsome buildings; gardens have been laid out, splendid hotels have been opened, and electric tram-cars ply in all directions. The climate is salubrious all the year, but is very hot for Northerners after May and before October. In a word, Palermo of to-day is not a new creation, taken as a whole, but a glorified Palermo of Brydone's time. The eighteenth-century city has expanded into the actual twentieth-century metropolis, has put on more flesh, but has preserved its original framework intact, together with all its medley of Norman and Saracenic architecture, of old mansions and substantial new houses.

As with the city, so with the citizens. The patricians of Palermo are noted for their graceful hospitality, and many of them for their literary tastes, and are worthy descendants of their cultured and courteous forebears of the eighteenth century. The masses in Palermo as in Naples have been neglected by successive Governments till quite lately, and consequently have continued to be much what they were a century and a half ago. They are still plunged in that swamp of ignorance and superstition which has clogged their better aspirations and nullified in a great measure their intellectual development. Their illiteracy is simply astounding, over 70 per cent. being unable to read or write; and the proportion of illiterate women is even higher, reaching probably 90 per cent. This crass ignorance contributes, of course, to foster crime in several ways. The better-disposed have inherited the traditional hatred and contempt, engendered by secular tyranny, for all public officials in general and all police officers in particular. These they look upon as so many licensed spies or *sbirri*, and consequently avoid having recourse to them in an emergency, preferring to take the law into their own hands, and *a fortiori* will seldom assist these detested functionaries even against the most atrocious criminal. This oblique morality and lack of confidence in the proper authorities have generated the *Mafia* in Palermo as they have the *Camorra* in Naples. Both are associations having as their chief objective the defeat of the ends of justice by screening criminals from pursuit or by obtaining their acquittal. Nothing stands in the way when these objects are to be attained: jurymen are threatened; witnesses are menaced with dire consequences; the jailers are suborned, frightened, or bribed into collusion with those members of the association who have, notwithstanding all the exertions of their friends, been condemned to some penalty, though usually a very slight one, for an ultra-savage deed of blood. The difference between the *Camorra* and the *Mafia* lies in the more regular organisation of the former rather than in any essential diversity of object. The *Camorra* has still its rank and file, its sub-officers, and its captains; the *Mafia* has nothing of the kind—it is rather of the nature of a loose alliance between all bad characters and malefactors to defy the law and to shield law-breakers. Wherefore, unless the venue be changed to a distant province, no criminal need fear condemnation.

Another strong point of resemblance between the twain is their fetich-worship of their two patrons. The worship of these local deities is not, indeed, peculiar or restricted to Naples and Palermo, for every city has its patron and patroness; but they are nowhere worshipped with the same pomp as in these two great towns. As Naples adores Saint Januarius, whose blood liquefies every year, and is protected by the saint against eruptions and earthquakes, so does Palermo worship Saint Rosalia, who protects against pestilence; but nowhere are the fêtes in commemoration of patron saints solemnised and celebrated with the same magnificence as at the annual midsummer festival still held in honour of Saint Rosalia, on which occasion the Palermitans outvie and outshine even the Neapolitans. Is it to be wondered at, then, that in such unfavourable moral and social conditions crimes of violence should be but too frequent, and that unorganised brigandage—or, to speak more correctly, highway robberies—should still occur? That these same causes have not been equally operative elsewhere—at Messina, for instance—is owing to the fact that they have been in a measure toned down by the quieter and more peaceful disposition of the inhabitants. But in Palermo itself, and throughout the whole province, lawlessness is still rife. Witness the number of outrages committed by desperadoes on the highways and byways; witness the *latitanti*, or criminals in hiding, who are abetted and assisted by sympathising or terrorised peasants; witness the threats sometimes received by wealthy landowners. It was, I believe, within the prefecture of Palermo, or on its borders, that Mr Rose, a British subject, was captured by some bandits of the old school who had survived the union with the rest of Italy. Their chief, by the way, was so grateful to Mr Rose for the start in life the latter had given him—involuntarily, it is true—that he not only treated his captive most courteously, but never failed for years to testify his sense of obligation to Mr Rose by sending him presents of game or fruit. This event occurred many years ago, and would be impossible now; but it shows that the gentlemen of the road held their own longer in the west than in the east of Sicily. Even down to the eighties of last century the old leaven was still fermenting among the western Sicilians, to judge from the precautions deemed necessary by the local authorities for the protection of our representative, Mr Stigand, who so worthily held the post of consul for all Sicily for several years. When this gentleman had on one occasion to leave the city on business or pleasure he was offered an armed escort. I do not know whether he accepted or declined the offer, or even whether, owing to extraneous influences, the district round Palermo may not have been passing through some of those transient periods of disorder which occur at intervals in Sicily. Anyhow, the fact is a very significant one, and could never have happened at Messina or any other western city.

The moral of all this is that visitors should bear in mind that they cannot count here on the same security which undoubtedly prevails at the present time in most regions of southern Italy; and while I think that the reports on the conditions of public security within the city itself are somewhat incorrect or exaggerated, I have no hesitation in accepting them entirely with respect to the relative insecurity of the country around. And I should strongly advise visitors inclined to be venturesome to obtain the opinion of His Majesty's representative as to the safety of the roads; or, better still, to obtain that of the British vice-consul, who is either a native or an old resident, and generally a man of much more experience and knowledge than his freshly imported and at times ignorant superior. In spite of these drawbacks, which are, after all, not to be compared with the many advantages offered by the city as a winter and spring residence, Palermo is a most fascinating place, where the upper or educated classes are among the most high-bred and well-informed of the whole peninsular and insular kingdom. Materially, too, Palermo exceeds in size and population all the cities of the south except Naples, and all those of the north except Rome, Turin, and Milan; and if she yields the palm to Naples in the number of her inhabitants—three hundred and thirty thousand to five hundred and thirty thousand—as a city she is far more regularly built, is handsomer, and situated in a more fertile and well-cultivated territory, whence the names *Hortus Siciliæ* (Garden of Sicily), *Aurea Vallis* (Golden Valley), and, lastly, *Felix* (Happy), which were successively bestowed on this beauteous city beside the blue Midland Sea.

LAUGHTER IN THE VALLEY.

Come not, friends, to my deathbed
With hushed tones and muffled tread,
Nor with shrouded light and sound
Shut me from life's cheerful round.
Passing as for but a while,
Let me pass with smile for smile!

Crack your jokes and sing your songs!
Nought that to your life belongs
E'er to me could come amiss,
Morning hail or good-night kiss.
Tear-touched though your greeting be,
Let not gloom o'ershadow me!

Day will dawn in common guise,
No strange cloud will blot the skies;
Earth and heaven will show the same,
That day, as the day I came.
Then, as babes are welcomed here,
We the parting soul should cheer.

Yea, for on our ultimate bed
Laughing flowers their petals shed;
O'er earth's myriad graves all day
Sing the birds, the children play.
Why from deathbeds chase the mirth
That, with love, makes heaven of earth!

THE SPIRIT-WORLD OF HAMPTON COURT PALACE.

By Lady ROLLESTON.

IT is remarkable that in this very material age there should be such a recrudescence of the superstitions of the Middle Ages and an apparently enlarging interest in the spiritual world. At the lowest levels of culture of which we have any knowledge the notion of a ghost-soul animating man while in the body, and appearing in dream and vision out of the body, is found deeply ingrained. When a new regiment arrives at Hampton Court Palace the ghost-stories are always revived; but a more increased interest in the spirit-world of the palace has recently been renewed by a constable seeing a group of figures moving along Ditton Walk. The party consisted of two gentlemen in evening-dress and from seven to nine ladies. There were no sounds except what resembled the rustling of dresses. When they reached a point about a dozen yards from him he opened the gates to let them in. The party, however, altered their course, and headed in the direction of the Flower-Pot Gates to the north of the gardens. At the same time there was a sudden movement amongst the group; they fell into processional order, two-deep, with the gentlemen at the head. Then, to his utter amazement, the whole crowd of them vanished—melted, as it seemed, into the air. One rather material explanation of this vision was lately given to me when I was lunching with some friends at Hampton Court Palace. Mrs Creighton, who has a set of charming rooms in the palace, is rather fond of taking evening strolls with her family; and on this particular night that the constable saw the mysterious group of figures they were returning to their rooms in the west front, and disappeared through a door which was hidden from the constable.

There is no more fitting setting for spirits to wander in than Wolsey's splendid palace of Hampton Court, the Versailles of England. Nothing could be more charming than the site. Amid green luxuriant foliage is seen the Thames winding his serene and majestic course, the vivid green or the deeper brown shades of the woods, hamlets, villas, fields, all presenting a panorama of unrivalled brilliance and effect. And, abounding in historical associations, it is almost the perfection of a summer residence, which Wolsey intended, as well as that of York Place in Westminster, for himself. But fearing the increase of envy on account of this magnificence, and desirous to please the king, he made him a present of the building, and told him that from the first he had erected it for his use.

In the year 1514 the manor of Hampton Court was leased by the prior Sir Thomas Docwra and his brethren, Knights of the Hospital of St John, to 'the most Reverend Father in God, Thomas Wolsey, Archbishop of York,' for a term of ninety-nine years, at a rent of fifty pounds per annum.

Hampton Court is an almost perfect specimen of Tudor palatial architecture. It is full of ancient historic charm, with bronze and marble to honour fame. Thus fountains, marbles, all that pomp supplies of arts and splendid ornaments, almost fatigue the eyes, and are haunted by innumerable spirits who are sometimes silent and often shrieked and wailed. And every corner of this old Tudor palace recalls the splendour of the mighty Cardinal Thomas Wolsey, who—from a butcher's son, arrived at the highest honours in Church and State—'when he went his last embassy into France, had in his retinue nine hundred horse of nobles, gentry, and others; he rode like a cardinal, very sumptuously on his mule trapped in crimson velvet and his stirrups gilt. Before him he had his two great crosses of silver, the king's broad seal of England, and his cardinal's hat, and a gentleman carrying his valance of fine scarlet all over richly embroidered with gold. As he was great in power, so no less in pride and insolence. He was offended with Edward Duke of Buckingham for spilling a little water on his shoe, and did afterwards procure his head to be cut off. He presumed to carry the Great Seal of England with him beyond the sea; he demolished forty monasteries to promote his own buildings, and

[*All Rights Reserved.*]

dared in conference to say familiarly, "Ego et Rex meus" ("I and my King").'

The visits from foreign ambassadors who remained as his guests were received in almost regal state, with feasting and banquetings brilliant beyond description; all that England could then boast of wit, intelligence, and beauty was welcomed at the palace. No man understood so well the interests of the kingdom in its relations to foreign Powers as Wolsey, or pursued them with greater skill and boldness. The more hazardous the conjuncture the more his spirit soared to meet it.

'In gardens wisdom dwelt in days of yore, and loved in cool shade and sylvan scenes to roam. One can imagine how much the great cardinal enjoyed his quiet walks in his garden, as was his habit, to say his evensong and ponder his mighty schemes of imperial politics three hundred and eighty-two years ago.'

The spiritual world is often with and directing the natural world; so let us hope that this masterful spirit is allowed to assist the earnest politicians of to-day, as no one can deny how much Wolsey loved his king. History tells us that in the year 1530, amid the early gloom of a November evening, the dying cardinal arrived from Nottingham at the grand north entrance of Leicester Abbey. Here was gathered, beneath the light of their flaming torches, the little expectant group of monks, with their abbot, anxiously waiting to receive their illustrious guest. The dying cardinal, with his ever-remembered greeting to the Father Abbot, said, 'Had I but served my God as diligently as I have served the king, he would not have given me over in my gray hairs. But this is the just reward that I must receive for my pains and study, not regarding my service to God but only to my prince,' and passed beneath the archway into the abbey precincts; and on account of his great feebleness his mule was led to the foot of the staircase ascending to his chamber, and he was with difficulty helped up to the bed from which he never rose. After his death, three days later, his remains were disposed of with all available pomp and ceremony, and at four on the morning of the next day, the monks having celebrated mass, the 'weary bones' of the once mighty cardinal were laid to rest in the Lady Chapel. 'Good times, and bad times, and all times pass over.' When passing through the solemn cloisters, galleries, state-rooms, picturesque gables, towers, turrets, and embattled parapets, one cannot but recall the many historic scenes told in pictures and even by the stones of Hampton Court Palace.

Here is the great Elizabeth by Zucchero. It is said she liked to show her golden-coloured hair, which was more reddish than yellow, and curled naturally. She had delicately shaped hands, which were very white. 'In audiences she would pull off her gloves about a hundred times to show her hands.' Elizabeth lived here so much, especially in the heyday of her youth and power, that it is not wonderful to find that some of the numerous scandals about the queen are supposed to have had their origin at Hampton Court. Her bedroom, still marked by her crown and initials, looks over the little Pond Garden, which remains as it was in Tudor days, with its quaint flagged paths and narrow flower-beds, and strips of turf surrounding a small pond and fountain in the centre, shut in by low brick-walls overgrown with wisteria and other creepers.

Thoughts of other days rapidly crowd the mind as you pass into the King's Guard-Chamber, the Queen's Gallery, Queen Anne's State Bedchamber, and into the Great Hall built by Henry VIII., its stained glass shedding a richly coloured light. Six of the windows in the Great Hall give the pedigree of Henry VIII.'s six wives, who all traced descent from Edward I. The Gothic roof is the most splendid in England of the Perpendicular period. The Minstrel Gallery is at the lower end, where stood the minstrels in their picturesque attire, and played during the festivities and banquets and other entertainments, as music and dancing were frequently enjoyed by the Merry Monarch and his friends; he danced in the Great Hall with Jane Seymour and Catharine Howard.

At Hampton Court Henry VIII. passed much time, and brought there his six wives. He came first with Catharine of Aragon, then with Anne Boleyn. Queen Anne, when she was led to be beheaded in the Tower, called one of the king's Privy Chamber to her, and said unto him, 'Commend me to the king, and tell him he is constant in his course of advancing me; for, from a private gentlewoman, he made me a marchioness, from a marchioness a queen; and now that he hath left no higher degree of worldly honour for me, he hath made me a martyr.' Queen Anne, mother of Queen Elizabeth, was the daughter of Thomas Boleyn, Earl of Wiltshire.*

He next came with his third wife, Jane Seymour, who died shortly after the birth of Edward VI. It is said that Queen Jane Seymour's ghost may be seen every night near the private stairway leading to her former rooms; she also appears in the Silver-stick Gallery with a lighted taper in her hand. Jane Seymour's rooms are now occupied by Mrs Keate and her family. Edward VI. was born in their drawing-room; so Mrs Penn, his nurse and foster-mother, although keeping a vigilant watch to prevent any royal infant from living in the palace, does not interfere with the children of those who are permitted to live there by royal grace and favour, as many happy children are born and reared

* Walter Earl of Essex married Lettice, daughter of Sir Francis Knollys, by Katherine, daughter of William Lord Hunsdon and Mary Boleyn, daughter of Thomas Boleyn, Earl of Wiltshire, sister of Queen Anne, the mother of Queen Elizabeth. Lady Dorothy Shirley, daughter of Sir Robert Devereux, Earl of Essex, Queen Elizabeth's favourite, brought the charming Irish property, the Barony of Farney, into the family, where the writer of this article spent her childhood. Mary Boleyn was an ancestress of hers.

in that romantic home. There is a tradition attached to the rooms now occupied by Lord and Lady Wolseley that no royal baby ever lives that is born in them, as they are haunted by Mrs Penn, the nurse of Edward VI., and when she appears the babies die. The last royal infant that was born there was the son of Princess Frederica of Hanover, in 1884, and the baby died. The Princess and her nurse are said to have seen the figure of Mrs Penn in their nursery the night of the baby's death. Well might these words be said to the shade of Mrs Penn:

> Go, Death, and spare a little child!
> For once be gentle, Death, and mild!
> Oh, take him not from smiles and play,
> And all the glad long summer's day!
> Ruthless is she. All thy joy
> She will with a smile destroy;
> She will check thy blameless play,
> Pleasures, pastimes snatch away.

History does not tell why Mrs Penn wishes to destroy all royal children that are born at Hampton Court Palace.

Anne of Cleves was also at Hampton Court, and immediately after her departure Henry brought down with him to the palace his fifth wife, Catharine Howard; and was married to his sixth wife, Catharine Parr, in the Hampton Court Chapel.

My mind is bewildered with echoes as I pass through the old, mysterious Haunted Gallery. I hear strange things that are soundless, and I see the invisible. There are sounds like flakes of snow falling, in their silence they touch us so lightly, like the feathers of angels' wings. Oh, cease then, poor spirit of Catharine! Do not wail any more.

> In the meantime that she
> The said ghostess, or ghost, as the matter may be,
> From impediment, hindrance, or let shall go free,
> To sleep in her grave—

'having a great while thrown her countenance ghastly about her, as if she had called all the powers of the world to witness of her wretched state.'

The saddest story of the palace is that of Queen Catharine Howard. Henry and Catharine came to Hampton Court after having been married five months, and Henry was still so much in love with her that he would not have their seclusion interfered with, so they spent the following four or five months in retirement at the palace. All nature smiled to greet the happy pair, in full luxuriance vegetation reigned as they walked by the bright enamel of varied hues on the grass-clad lawns, and trees and shrubs here lightly grouped and there negligently placed delighted their eyes and gratified their taste. Beneath an arch of overshadowing green they pass. Fair blooms the vine, the purple fruit is seen, and charming shrubs and shadowy arbours and verdant bowers, and round their stems innumerable flowers. But, alas! a stormy day in this labyrinth of charm and beauty is coming, and envy traced them in a fatal hour. Cranmer and others are jealous of their happiness. Courtiers are very human, and suffer more than most communities from small jealousies. Whispers and gossip are heard in the palace, an evil eye is on the queen, and the blow that has been preparing is ready to fall on her unsuspecting head.

Queen Catharine is walking in the garden. A feeling of happiness passes through her. 'Woe to those who feel fay! How lovely the world is! My soul is possessed with yearnings; the music of love breathes all through my spirit, the king is so kind.' They go into the chapel together, and the queen sends up her soul to God. She shudders, and a feeling of nervous depression comes over her.

'In the chapel, beneath the sacred domes, joyful and hopeful their holy vigils keep, pious awe seems to haunt the arched cloisters where sometimes aching hearts, in bitter anguish unrestrained, to the altar their vows complained. Into the king's hands is placed a paper by Cranmer, which he opens and reads, and his love is suddenly turned to bitter and relentless hate, for the paper contains damning disclosures against the chastity of his queen.'

There is nothing more jealous than an animal, and all animals, like people, suffer from jealousy which the more spiritually minded are more free from. Henry VIII. was a keen sportsman, and hunted, shot, hawked, and fished in the river and in the ponds; but he had a great deal of the animal in his nature, so he suffered most intense pangs of jealousy.

Cranmer watched the effect on the king with great satisfaction, as he wanted to get rid of the queen as soon as possible—yea, even by the foulest means.

The king was furious, and the queen was very harshly treated, and was kept a prisoner in her room, from which she escaped into the old mysterious Haunted Gallery, the door of which is on the right hand as you go down the queen's great staircase. It was into this gallery she escaped from her room, and ran along the gallery to seek an interview with the king, who was hearing mass in the Royal Chapel. Just before she reached the door the guards rudely seized her and carried her back, while her ruthless husband, in spite of her piercing screams, which were heard all over the palace, continued his devotions unmoved. His prayers cannot have been very acceptable to Heaven, and most probably he received the just reward for his cruelty. History says her grief was terrible, and even Cranmer, who was her principal accuser, was touched by her utter misery, which clung like the death-grapple of a drowning man, sinking her down into darkness and death; and this was followed by a calm a thousand times more terrible—the creeping agony of despair that brings with it no power of resistance, and poor Queen Catharine was removed to Sion House and then to the scaffold. Can one wonder that from time to time an apparition of the queen appears, victim alike of hatred and of love? Her injured spirit still frequents the gallery, and remembers the scenes which still

she loves. Dressed in white, she hurries along towards the royal pew, but before reaching it returns, uttering most unearthly shrieks of despair. Residents in the palace have often heard poor Catharine's wails.

Time and space are not given in sensation; they are not the sensational matter of perception, but something that makes it possible for us to represent all parts of the matter arranged in certain relations to each other; and this we may fairly call the form of perception. In a phenomenon I call that which corresponds to the sensation its matter; but that which causes the manifold matter of the phenomenon to be perceived, as arranged in a certain order, I call its form.

This distinction is employed by Aristotle in his exposition of the soul. The soul belongs to the category of substance or essence (not that of quantity, quality, &c.); but of the two points of view under which essence may be presented, the soul ranks with form, not with matter—with the actual, not with the potential.

Man exists from God, and has a living soul within him that shall not be quenched for ever, and communion between departed souls and the spiritually exalted of earth has been a belief for ages. Let us hope that the soul of poor Queen Catharine Howard has been allowed to visit the sad scenes of her life for some good purpose, as it is said that spirits can help a man on earth towards heaven.

Henry VIII.'s arms and initials may be seen all over the palace, generally intertwined with those of his many wives. It is said before one monogram was completed another had to be begun with a different initial. As is the custom of to-day, fashion was set by royalty. Henry VIII. cut his hair short, and immediately afterwards all the English were so moved with his example that they were all shorn, whereas before they used to wear long hair.

And yet another honeymoon was spent at Hampton Court. Queen Mary and Philip II. of Spain, five days after they made their entry into London, returned to Hampton Court to spend their honeymoon. On the 23rd of April, being St George's Day, after a grand high mass in the Chapel Royal, King Philip, as Sovereign of the Order of the Garter, went with the Knights and the Lords of the Council in their robes in procession round the cloisters and courts of the palace.

Charles I. spent some of his happiest days at Hampton Court; and it was to this palace he was brought a prisoner in August 1647, until he escaped, passing through a room called 'Paradise' and the private passage underground to the river-side, where he was met by Berkely and Ashburnham with horses, and they proceeded towards Southampton, and thence to the Isle of Wight. The window can still be seen, unaltered, from which he escaped.

Oliver Cromwell was for a time installed in the palace; and although he was famous for destroying beautiful things, he saved the famous old Flemish tapestries which belonged to Cardinal Wolsey from being sold: 'The Triumphs of Fate,' 'Renown,' 'Time,' 'The Story of the Seaven Deadly Sinnes,' and eight pieces illustrating the life of Abraham, which for richness and splendour cannot be matched in Europe. They were bought by Henry VIII. Cromwell's daughter was married to Lord Falconberg in the chapel, and his favourite daughter, Mrs Claypole, died there.

This reminds me of Wolsey's advice to Thomas Cromwell:

> Say, I taught thee,
> Say, Wolsey, that once trod the ways of glory,
> And sounded all the depths and shoals of honour,
> Found thee a way, out of his wreck, to rise in;
> A sure and safe one, though the master miss'd it.
> Mark but my fall and that that ruin'd me.
> Cromwell, I charge thee, fling away ambition:
> By that sin fell the angels; how can man then,
> The image of his Maker, hope to win by it?
> Love thyself last: cherish those hearts that hate thee;
> Corruption wins not more than honesty.
> Still in thy right hand carry gentle peace,
> To silence envious tongues. Be just, and fear not:
> Let all the ends thou aim'st at be thy country's,
> Thy God's, and truth's; then if thou fall'st, O Cromwell,
> Thou fall'st a blessed martyr!

Charles II. spent his honeymoon at Hampton Court. William and Mary lived there, and it was during their sojourn that Christopher Wren built the south front containing their suite of state apartments. The great Fountain Garden was also partly laid out by them.

One of the most curious relics in the gardens is the long walk of wych-elm usually called 'Queen Mary's Bower.' This is one hundred yards in length, twenty feet high, and twelve feet wide, and what Evelyn calls the perplexed twining of their branches makes a complete arched roof overhead.

On the 21st of February 1702, in riding to Hampton Court from Kensington, King William's horse fell under him, and he himself was thrown upon the ground with such violence that his collar-bone was broken. He was conveyed to Hampton Court, where the fracture was set by Roujat, his Sergeant-Surgeon. He died on the 8th March, never having quite recovered from his accident. William was a fatalist in religion, indefatigable in war, enterprising in politics, dead to all warm and generous emotions of the human heart, a cold relation, an indifferent husband, a disagreeable man, an ungracious prince, and an imperious sovereign.

Queen Anne also lived a great deal at Hampton Court, and the first two Georges; but George III. never lived there after his accession. It is said that when he was a boy his grandfather boxed his ears one day at Hampton Court, and he was so disgusted at the treatment that he would never live there afterwards; and it was during his reign that the palace ceased to be a royal residence, and gradually came to be divided into suites of apartments,

granted by royal favour to those who had served their king and country.

'Kings to magnificence are doomed by fate; they yield to Heaven's decrees, and for their country the regal cares assume. Yet light weighs the sceptre which a people loves. Oh, may the nations thrive beneath my sway, and general bliss my sacrifice repay.' How often our much-beloved King Edward VII. must ponder on old times when visiting the scenes where so many of his royal ancestors lived and loved! A thousand memories on his bosom press as among his great forefathers' haunts he wanders, scenes of their woe and scenes of happier days; their shades pursue him; oft he seems to hear their notes complaining murmur on his ears, victims, foul crimes, and regicides—'what varied pictures 'mid the shades appear; each station, age, and rank seem mingled here:' Wolsey the inspired speaker in his king and country's cause, the hero famed, the kings and consorts; Henry VIII., with his loved partners hanging on his arm; again another consort. They point to the spot where first they learned to love, where first they met, and with faltering accents owned a mutual love.

The country must feel deeply grateful for the privilege granted by her late Majesty Queen Victoria and to King Edward in renewing the permission for freely opening to the public the beautiful home of their ancestors at Hampton Court; and we need not be surprised if various processions of spirits wander invisibly and visibly through the galleries and courts and gardens: Cardinal Wolsey and his attendants attired in liveries of crimson velvet and gold, and the two gentlemen bearing the Great Seal and his cardinal's hat, and the priests with silver pillars and the great crosses of silver.

'But the manifestation of the Spirit is given to every man to profit withal, to another discerning of spirits.'

The writer desires to acknowledge her indebtedness to Mr Law's history of Hampton Court Palace, also to Hume's and Smollett's *History of England*, for the historical facts recorded here.

A PAWN IN THE GAME.

CHAPTER V.—TRIAL AND SENTENCE.

T noon next day the council that governed the school met. Father Berton was its head; General Keralio, the inspector, a white-haired, fiercely moustached veteran, sat at his side. The teachers—monks for the most part, heavy of face and gross in body—sat round the table. Jean was brought in, and every man at the table regarded him with stony eyes. It was clear he had no friend there. He came of alien blood; he was hopelessly stupid; his very presence in the college was a breach of its constitution. Then he was a heretic, and he had done a deed which affronted his monkish teachers at their most sensitive point. It was an offence not only against discipline but against religion. He had made ridiculous the two most venerated figures in their Order.

Father Leyrault told his tale. He had detected the lad, after midnight, creeping back to his room in the darkness with the air of one who returned from the commission of a crime. When questioned he had refused to say where he had been. His silence was a confession of guilt. What needed concealment must necessarily be a wickedness.

'Tell me why you left your room,' said the inspector; and something in the soldierly directness of the question and the straightforward glance of the speaker's eyes changed Jean's feelings. He suddenly resolved to speak. It could not harm his comrade.

'I went to have a talk with Napolione. I thought he would be miserable in No. 10.'

'And had you a talk with him?'

'Yes.'

'How long were you with him?'

'More than an hour.'

Father Berton smiled incredulously, but the inspector was just-minded.

'Let us hear,' he said, 'whether the other lad confirms this.'

Napolione was sent for, and stood—square-browed, dark-featured, with a suggestion of gloomy power in every line of his face—before the council.

'Did the cadet Laurente come to your room last night?' asked the inspector briefly.

'No, sir.'

'He says he had been an hour there.'

Napolione looked calmly at Jean, and was silent for a moment. Something in his look held the whole group breathless. The Corsican lad's eyes were as frosty as the Alps with all their snows.

'He lies, sir,' he said with clear and steady voice. 'No one came to me.'

The twang of Corsican patois was yet in his speech; but the use of 'g's' for 'c's' only made his words more emphatic. The commanding face, the composed look, the high, deliberate voice, all carried conviction with them. Jean gazed and listened in bewilderment. This was his chum! It was through trying to help him he had fallen into trouble; and now his one comrade was destroying him with a lie, and without a touch of remorse.

The two cadets were sent back to No. 10, and the little group on the dais consulted together.

'Who is Laurente, and why is he called "*L'Anglais*"?' asked M. de Keralio.

'He is a paying student,' replied Father Berton; 'his guardian is a Madame Laurente, who resides in

Paris, and is well known. The other lads call him "*L'Anglais*" because of his English speech and ways, and there is no doubt his place in Brienne is the result of a fraud. He claims that his father was English. He is always fighting, always under punishment, and he is very stupid. And,' added Father Berton in a tone of pious horror, 'he is a Protestant. No one but a Protestant would ill-use the figure of a saint.'

'I suspect, father, you do not know what French boys are capable of,' replied the inspector with a dry, brief smile. 'There is no direct evidence against Laurente, but he lies, no doubt, in his tale of visiting Napolione. And why should he lie unless he had something to conceal? Let him be dismissed from the school and sent back to his guardian. As for the Corsican,' added the old soldier, 'let him go to Paris;' and, taking his pen, he wrote the necessary order.

Meanwhile the two lads sat looking at each other in No. 10. Napolione was the least disturbed.

'Did you expect me to ruin myself?' he asked coolly in reply to the unspoken reproach of the other's eyes. 'I want to go to Paris, for Brienne is purgatory; and had I agreed with your tale it would have cost me my nomination. Why should I commit suicide out of mere sentiment?'

'But you lied,' said Jean with characteristic directness.

The other shrugged his shoulders contemptuously.

'You made me out a liar,' added the English lad.

'It is every one for himself at such times, my poor Jean. What would you? Was I to ruin myself?' asked the Corsican in unanswerable tones, and with a note of cold anger in his voice. 'You are unreasonable.' Then, with uptilted chin, he asked, 'What is truth, or what is friendship? I owe nothing but to myself.' And poor Jean almost felt as if he were the criminal, and that truth and comradeship were crimes.

'I must go to Paris,' Napolione repeated as he paced the room to and fro. 'My career lies there. Why should I sacrifice it? A lie is only one set of syllables instead of another. What are truth and falsehood but tools? And a wise man uses either of them as it suits his purpose.'

So calm, not to say convincing, was the lad's speech, and so unrebuked his air, that Jean felt all his moral landmarks were shifting.

'They will expel you,' said Napolione in a matter-of-fact tone, 'but that is no injury to you. Why should you be a French officer when, for all your French name, you have English blood in your veins? Then you are stupid. You will never make a career. As for me,' continued Napolione, 'I shall rise, and some day,' he added with a magnificent gesture, 'I will help you.'

'You might have helped me to-day,' Jean protested, 'if you had only spoken the truth.'

'Why should I?' asked the other lad in final tones. 'You are unreasonable.'

Jean could only look at his comrade helplessly. That glacier-like selfishness froze him till the fire of anger itself was quenched.

M. de Keralio meanwhile had written that description of the Corsican lad which has since become historic: 'M. de Bonaparte, born August 15, 1769; height, 4 ft. 10 in. 10 lines [about 5 ft. 3 in. English]; excellent health, docile disposition, mild, straightforward, thoughtful. . . . This boy would make an excellent sailor; deserves to be admitted to the school in Paris.'

The old soldier's eyes had certainly lost their vision when he wrote this description of the lad who stood before him. 'Docile, mild, straightforward'! These were exactly the qualities he did *not* possess. Father Berton's endorsement was written in strangely different terms: 'Character masterful, imperious, and headstrong.' The monk read '*Paille au nez*' better than did the soldier.

A fortnight later Napolione left for Paris, being one of four cadets nominated to enter the military school there. Jean had already left Brienne. He had been formally expelled as being guilty of 'disgraceful conduct;' and his gloomy face as the journey began hinted at the reception he expected in Paris.

It was late in the day when the diligence started. The black, level shadows cast by the setting sun ran before the plodding horses, the wind scuffled drearily in the tree-tops, and the horizon before them, darkening into night, was made blacker by a gathering storm. The shivering, friendless lad perched high beside the driver felt in some dim, vague way that his boyish life was as cheerless as the landscape about him and the black skies before him.

(To be continued.)

HOME INDUSTRIES THAT SHOULD BE CULTIVATED.

ONE of the questions now occupying the minds of many people in the British Islands is that of the development of our home industries for the benefit of ourselves. It is not a question that ought to be identified with any political party, although it has been so identified in one, at least, of its aspects. Rightly considered, the matter is economic, personal, and patriotic. On all sides men are asking, 'Why should we help to enrich foreigners at the expense of our fellow-countrymen, or, in other words, at our own expense? Is there any reason why we should buy the animal and vegetable products of other countries when we can buy the same products at home for the same money, or less?' No doubt, in a densely

peopled territory of comparatively small extent a point must be reached at which the home-supply falls short of the demand. When that event happens there is no alternative but to look abroad for a further supply. This, as is well known, is what has actually happened in our case with regard to cereals. Our islands have long ago ceased to be the mainstay of our population in this respect; and although the bread we eat has been baked at home, the grain from which it is made has been grown by farmers in North America, Hungary, and other lands vaster and more productive than this Northern archipelago of ours.

In such a case the obvious thing to do is to ask ourselves, 'Is there any product that the foreigner can not supply as cheaply and as well as the British farmer?' Baffled in one direction, we turn to this side and that for alternatives. And the result is in some quarters highly satisfactory. If it does not pay to grow wheat, we can at least grow grass with profit. The grazing of sheep and cattle, conducted with discretion, must always be worth while. There is no beef or mutton to equal ours. Whether the mutton be from the South Downs or from Wales or from the Scottish Highlands, it will always command better prices than any imported mutton. Moreover, in spite of the convenience of 'cold storage,' there is a prejudice against fresh meat that has been fresh for several weeks. It is perfectly good and wholesome, and there is nothing to be urged against its flavour. To those who desire or require to practise economy imported meat is undoubtedly a boon; but there will always be a large class willing to pay a higher price for home-bred beef and mutton of the best quality. There is little fear that the supply will exceed the demand. And even with cured meat we stand at an advantage. Belfast and Yorkshire hams, Limerick and Wiltshire bacon—is there any mortal pig of foreign birth that can be transmuted into such toothsome forms as these? Westphalia may make a good second, but nothing more.

And grazing does not only imply the rearing of sheep and cattle, not to mention horses, although horse-breeding is a profitable form of industry, especially in Ireland. Grazing also denotes dairy-farming in all its branches. In this matter we have, unhappily, lagged far behind such countries as the Netherlands, Denmark, Sweden, Norway, and Finland, with the consequent result that these sensible and shrewd foreigners have pushed their way into our markets, and have proved most dangerous and successful rivals to our own dairy-farmers. Finland is regarded by most of us in this country as a semi-Arctic region scarcely worth taking into consideration in matters of this sort. Nevertheless Finland annually exports butter to the value of fifteen hundred thousand pounds, and of the butter thus exported four-fifths is sold to us in the United Kingdom. In other words, twelve hundred thousand pounds are paid every year to Finland which might be paid to our own dairy-farmers instead. From Denmark, again, this same useful and necessary article of food comes in still greater quantities. Every year we pay to Denmark some nine or ten million pounds sterling for butter alone. Indeed, the Danes have long been recognised as the leaders in this industry, and we have again and again commissioned our experts to go over to Denmark for the purpose of inquiring into their methods. For method constitutes the real crux of the question. Neither Denmark nor any other foreign country possesses natural advantages superior or even equal to ours in this respect. A recent analysis of various brands of butter has proved, as has been pointed out in the June number of this *Journal* (p. 416), that 'the best butter in the world is obtained from Jersey cows fed on English pastures; no foreign or colonial butter is quite equal to the best made in England. English and Scottish dairies are now turning out butter superior to that which is sent out from Normandy or Denmark.' Unfortunately, these statements are not yet capable of a general application, although they may be so some day. If all of those engaged in dairying in the British Isles—farmers, crofters, and cottagers—were to follow the methods which a few, comparatively speaking, have adopted from Denmark, our consumers would do much more in the way of enriching our own producers and less in the way of enriching foreigners. This would not be the outcome of any benevolent scheme for aiding others at some personal sacrifice. It would be the result of a healthy, if selfish, desire to obtain what is best at a reasonable price.

We turn to Denmark, again, for much of our egg-supply, paying annually to that country a sum of about two million pounds for eggs. From the Netherlands and other Continental countries we also import large quantities of eggs every year. Much of the money thus paid might go into the pockets of our fellow-countrymen if the question were better understood. At present our home producers only receive about one-half of the eighteen million pounds which we pay annually for eggs and poultry. At the congress of foreign producers held in Austria in April 1907, it was stated that during the year 1906 no less than one hundred and fifty-seven thousand two hundred and eighty-four tons of eggs were imported into the British Isles; and that the import-value of eggs had increased from two hundred and seventy-eight thousand four hundred and twenty-two pounds in 1856, to four million one hundred and eighty-four thousand six hundred and fifty-six pounds in 1896, and to seven million ninety-eight thousand one hundred and thirty-seven pounds in 1906. It is not to be supposed that we can ever be independent of the foreign supply; but our own home-supply is capable of being enormously increased. A writer on 'The British Egg Industry' in the *North British Agriculturist* of 11th July, and the author of an article in the *Spectator* of 20th July 1907 on 'English Eggs and Others,' are wholly in agreement as to this. Both writers,

happily, point to an awakening among our poultry-farmers already, with excellent results. Two societies, the National Poultry Organisation Society and the Utility Poultry Club (thus differentiated from clubs formed for the breeding of 'fancy' strains), are working on scientific and business lines with marked success. The demand for the eggs sold by the former society 'far exceeds the supply, and at the present time sixty thousand more eggs could be disposed of every week if they could be produced.' They *could* be produced, but 'the supineness of British producers' is still an obstacle. And yet a ready market awaits them. 'There is no need for artificial protection for British producers,' says one authority with reference to this industry, 'for they can always obtain top prices for their goods.' 'The most profitable egg is, of course, the absolutely fresh breakfast egg,' says the *Spectator* writer already cited. 'It is surely plain that the English poultry-keeper on the spot has a geographical advantage in marketing this absolutely fresh egg which no Continental competitor can take from him.'

The same reflection is applicable to the Scottish poultry-keeper. At the present day the Hebridean islands are sending a considerable quantity of eggs to the mainland markets. It is stated that the island of Tiree alone exports one thousand pounds worth every year, and that an Uist trader despatches on an average five thousand eggs a week. These facts emerged in the course of the inquiry made last summer in connection with the Royal Commission on Canals, with special reference to the formation of a ship-canal across the north end of the peninsula of Kintyre; and those who furnished this evidence expressed the opinion that such a canal would at once treble the island exports. It will be seen, therefore, that this industry is capable of great development in the Hebrides. It can be developed, of course, to a great extent all over the British Islands. But the Hebrideans typify the class which practises poultry-farming at the minimum of cost, with the consequent maximum of profit, although on a small scale. For the large poultry-farm of the capitalist is by no means predestined to prove a financial success, although, if managed with discretion, it may become so. Poultry-farming on a large scale implies outlay, preliminary and annual, which is practically absent altogether from the estimates of the small producer, whose poultry-rearing is simply an incident, although a lucrative incident, in his affairs. For his fowls are merely minor adjuncts of his cottage or croft, picking up their sustenance without almost any direct demand upon the purses of their owners. 'All over the world,' observes the *Spectator* writer, 'the commercial production of eggs is chiefly in the hands of the cottager, the small holder, and the farmer, and is likely to remain there. The public is coming to recognise the advantage which these classes have possessed for centuries in the work of egg-production.'

Several other home industries that are at present inadequately worked might be discussed in this paper did space permit. 'Fruit-Culture on Small Holdings' formed the subject of an instructive article contributed to the *Journal* of 13th August 1904, and it is, therefore, unnecessary to enlarge upon that subject here. It need only be said that fruit-farming is a modern institution in the British Islands, and that its growth has been most rapid and conspicuous. Many years ago William Ewart Gladstone urged upon farmers the wisdom of thus modifying their ancient ways in view of the great and overpowering competition from over seas in grain-production. His words were then received with derision and scepticism, for the British farmer of that time regarded market-gardening and fruit-culture as much beneath him. To the onlooker this feeling seems quite irrational; for if a man is to make his living by cultivating the soil, it is surely a matter of no importance, as regards his personal dignity, whether he grows wheat or raspberries, turnips or parsley. His business is to make the soil yield him as large an income as it is capable of doing, and with this end in view he ought to study to grow those crops which are in most demand. Grain does not suffer by being borne ten thousand miles from the land of its origin. But people want fruit and vegetables to be as fresh as they can possibly be; and therein lies the immense advantage of the home farmer over the foreigner.

Of all our crops none is more deserving of attention than 'the harvest of the sea,' for this represents an industry which has not nearly reached its highest development. Certain fishing-grounds —the Dogger Bank, for example—are no doubt worked to their full extent. But this cannot be said of our western seas. It is more than thirty years since the late Anderson Smith, an excellent authority on such matters, urged the development of the fisheries of the Outer Hebrides. 'There are lots of fish in the Lewis waters,' he observes, 'and lots of fishermen on the Lewis shores; and when energy and capital and science are tired of wonderful mines at the ends of the earth, and suicidal railways in the middle, it will no doubt supply a far greater amount of nourishment than it has yet done to the wearied brains of our teeming cities.' There has been no radical change in the condition of things since these words were written. 'At present the west of Lewis is simply teeming with splendid fish,' writes 'A Crofter's Son' in the *Scotsman* of 2nd August 1907. 'Between Carloway and Valtos, in Uig parish, single boats land over one thousand ling each between Monday and Saturday when there is a good season. But the industry is going down for two reasons: (1) fishermen are discouraged through the obnoxious depredations of unscrupulous trawlers, who ruin the beds; (2) there are no modern means of transit. It is "as it was in the beginning." Ling at present sell at ninepence each. If the market were brought nearer by means of speedy transit the price might be doubled.'

The remedy asked for is timely Government aid, which would work a beneficent revolution in all that area, and render it in the future more than independent of all such aid. It cannot be said that the demand for a more efficient policing of our western waters, in order to put a stop to all trawling depredations, is a demand in the direction of Socialism. It is nothing more than the demand made by every honest citizen for sufficient police protection against thieves and housebreakers.* And as for the question of improving methods of transit, that is a matter which occupies the attention of officials and the expenditure of public money in many parts of the United Kingdom. Further, to show that the development of the Lewis fisheries is not solely a Hebridean question, it may be added that one of the reasons advanced by 'A Crofter's Son' in justification of his plea is that, by thus reviving the local spring-fishing of the Hebrides many of the Hebridean fishermen who at present compete with the East Anglian fishermen in the North Sea would remain at home. To foster the Hebridean fisheries would be to confer a benefit upon the fishermen of eastern England. But this is only a minor argument. The whole of the United Kingdom would benefit, directly and indirectly, by the judicious development of this or any other neglected industry. It is not sufficiently realised that the chain of the Outer Hebrides constitutes, as it were, a permanent fishing-fleet anchored out in the Atlantic, and that for want of capital and proper supervision that fleet is for the most part lying idle.

Nor does the question limit itself to the selling of fresh fish. The various establishments for the curing of fish would be multiplied proportionately with the fisheries. And the methods of curing are capable of being widely extended. Some forms of curing are virtually ignored in the British Islands for no obvious reason. The tinning of sardines is an immense industry in Brittany. In Norway all kinds of fish and fish-roe are prepared as savouries, and hermetically sealed in tins. Nansen's ship, the *Fram*, was stored with Norwegian tinned fish and savouries when it set out on its Arctic expedition many years ago. Norway is not better situated than the British Isles for such an industry. But how much have we done in that direction? On the Kentish and Cornish coasts young pilchards and sprats are tinned in oil, like the French sardines, with profitable results. Beyond that, there appears to be nothing else done in this way; and yet it opens out a wide vista for the enterprising.

In these paragraphs I have only glanced at some details of special interest. But the statements adduced seem to denote clearly that our own islands can still offer as much room for successful business achievement as any of the lands lying beyond the British seas.

* 'In a case of illegal trawling tried at Campbeltown on September 4, 1907, the sheriff, before pronouncing sentence against the offender, made the following pregnant remarks: "From a tolerable experience of convictions of those who have been guilty of transgressing the law as to otter trawling, I venture to think that until Parliament sees fit to permit the imposition of some much more drastic punishment than the limit which at present the Courts have power to inflict, and the provision of more adequate means for the detection and capture of offenders, such as more and faster cruisers, little can be done effectively to prevent illegal trawling, and what at present, it must be confessed, appears likely to be the ultimate consequence—the ruin of the entire fishing industry. It is becoming notorious, amounting almost to a public scandal, that the punishment which at present it is in the power of the Courts to inflict is wholly inadequate to prevent the infraction of the law, and that the number and the speed of the protective vessels at present at the disposal of the Fishery Board is wholly incommensurate with the necessities of the case."—*The Scotsman*, September 5, 1907.

DICK HELLIFIELD'S DOUBLE.

CHAPTER III.

'YOU are not going out on the balcony, Dick?' said I after dinner, when, as usual, with a cigar between his fingers, he made for the folding-windows.

'Why not?'

'You don't want a repetition of the attempt at Port Said—a repetition that may have a different ending—do you? It will be like asking him to fire if you sit there.'

'Look here,' said Dick, stepping out and gazing over the ornamental railings. I followed, and turned my eyes downwards, and there, in the entrance to the hotel, stood the ever-watchful Ahmed. 'If he raised his hand Ahmed would see him—ay, and grab him.'

'What good would that do, Dick, if you were shot?'

'Well, not much for me, I confess; but Hasan would receive his deserts. And you needn't trouble, Jim. He will not raise his hand.'

'Why?'

'The place is too public, and there are no hiding-holes. He would have to come into the middle of the square to get anything like a decent bead on me. I shall be safer here than if I were to stray to the end of the gardens.'

'You seem to me to be strangely careless, Dick. He wouldn't stop to get a bead on you. He'd simply whip out a revolver and fire.'

'And miss, if he dared to do it. But he will not dare—not with Ahmed watching, and so many people about, and no hole to pop into. Make your-

self comfortable, Jim. If you get into a tremor about it I shall have to shorten my leave and cut back to the barrage; and I don't want to do that—at least, not until my time is up.'

'Nor do I. But I do not think you are wise, Dick, in exposing yourself to your enemy. He's a desperate fellow, and evidently means to kill you. What I say is, don't give him a chance. For instance, you are about to light that cigar. Light it inside, not on the balcony.'

'I will, to please you;' and he stepped back into the room, struck a match, and held it towards me; then, when mine was alight, calmly lit his own. 'I see your point. It is growing dusk, and the flare of the match, to a spy like Hasan, would have revealed my features even if he were standing in the shade of the trees on the other side of the square—which he is at this moment; but I am not going to let that interfere with my enjoyment of the evening;' and he returned to the balcony and flung himself into a chair.

What could I do but follow? I planted my chair in the angle, hiding him in part from the view of the spy, and thereby taking a certain risk myself. To obtain a clearer view of him, and to fire with any certainty of hitting him, the spy would have to move from his shady retreat. Dick observed the manœuvre, and gave me a placid and yet thankful smile.

'Hasan you call him?'

'Yes,' said Dick; 'and now, while he is watching, but beyond the reach of my voice, I will tell you how we were thrown across each other.'

I tried to compose myself to listen, but my eyes would wander occasionally to the motionless figure gradually becoming obliterated by the deepening shadows of the foliage across the square.

'You would not be able to guess his nationality, Jim. He calls himself an Ottoman, and dresses like one, but his blood is not all Turkish. He came from Turkey most likely, and probably from the neighbourhood of Constantinople; but there is Georgian blood in him, and not a little of it, or I am very much mistaken. Anyhow—for that doesn't matter—he has influence in high quarters, or (and perhaps more correctly) some one in high quarters with the ear of the powers that be is sufficiently interested in him for some reason or another to push his claims. Certainly he would never have secured for himself the position which another secured for him. He hadn't it in him to command the position, and he shamefully abused it when, as a special favour, it was granted, not for his own sake, but for the sake of the great official who had been persuaded to befriend him.

'The request came when there happened to be a vacancy; and the chief, who is independent as a rule, and prefers to select his own responsible men with little or no regard for outside recommendations, and who would certainly resent sharply and vigorously the least attempt at outside interference, complied with the request and allowed him to take up the work. You see, Jim, for the rough work in the construction of the barrage we employ the fellahin, and their labour is contracted for, so many men per day at so much for the lot, and the contractor pays each one out of the lump sum we give him, and nails what he can for himself. Native navvies—so you may call the fellahin—such of them as are employed at the barrage; but, bless you! they do not work like the navvies at home. They haven't the stamina. Well, Hasan became the contractor, and supplied us with men as we wanted them—a contractor of labour merely, not of materials. Some of the men he brought with him from Cairo; others he obtained from the villages round about; and a terrible taskmaster they found him, a kind of survival of those we read about whose thongs cut deeply into the flesh of the toiling Hebrews when they had to make the bricks without straw.

'Bit by bit unpleasant things about him came to my ears. From the wages of the men he nobbled much more than was his rightful due, but in Egypt almost any other man would have done the same. It wasn't that which finished him. Not content with robbing the men, he began to rob the exchequer in this way: payment was always required for the full tale of men, although the full tale was not always forthcoming. He never hinted at any rebate, but quietly slipped the extras into his own pocket; and so cunning was he in the manipulation of the numbers that it was some time before we found it out. Of course that couldn't be allowed to go on. It was one thing to rob the men, but it was quite another thing to rob the exchequer. The men were left to find their own remedy; the remedy of the exchequer was dismissal—but not immediately, for we wanted to make sure of him. At last the beggar wriggled himself into a cleft stick, and the chief hurled him away.

'In the meanwhile, however, he was playing a double game. Where were the men who should have been at work, and weren't? He was using them for his own ends, Jim, even while he was pocketing their wages. There were tombs in the vicinity of the barrage, as there are everywhere in Egypt; and under his direction these were carefully located and rifled systematically, and their contents sent into Cairo to the curiosity-dealers, with whom he was doing a lucrative trade. Scarabees, cerecloths, parchments, bronze statuettes, all sorts of sepulchral knick-knacks, were collected for him, and readily disposed of to the dealers, who in their turn, and just as readily, sold them to the swarm of tourists, doubtless making very handsome profits on the transactions. It was illegal, but nobody cared for that; and Hasan had the workers under his thumb. He paid them a miserable pittance for their trouble, and when they failed to meet his demands did not scruple to use the bastinado.

'These, however, were not the things he was after. He had his eye—and a well-trained eye, too—

on things more valuable. The scarabees were not all alike. Some were engraven with cartouches which made them worth their weight in gold. Now and again a statuette was brought him which, by the weight of it, and in response to certain tests, he knew to be made of a metal more precious than bronze. A jewel or two, even, would turn up. And none of these found their way to Cairo. He kept them for private negotiation. They meant wealth to him in time, and all the sordid pleasures which wealth could easily buy.

'How do I know all this? Well, the failure to supply the full complement of men, notwithstanding the payment of the amount bargained for, I found out for myself; but the rifling of the tombs reached me through a little conversation I had with Ahmed. You know, Jim, I am a bit of a collector myself; and Hasan couldn't carry on a game like that, not for long together, without somebody hearing about it. For among themselves the men would talk, and when they saw the chance of it they were only too delighted to deceive him. With all his precautions he could not prevent the thing from leaking out; nor could he prevent the men from paying him back in his own coin by the appropriation of such small articles of value as they could successfully secrete, say, under the tongue or beneath the fold of the big toe. They are mostly rogues. It runs in the blood.

'Ahmed was not one of Hasan's men. He was there before Hasan came. His special duties were connected with the stores—receiving them, checking them, handing them out—and honestly and well was his work performed. I had often noticed him, and gradually formed a good opinion of him, and afterwards took him into my personal service. Through Ahmed I was able to acquire several interesting scarabees, a small bronze libation-bowl of really excellent workmanship, a delicate golden statuette of the goddess Hathor, and—what was most curious of all, and unique so far as I know—a little clasp, the two parts of which were fashioned into the forms of Osiris and Isis. This clasp was also of gold, and the wonderful thing about it was that when the two parts were brought together, as in the act of fastening the robe or girdle to which it had belonged, there appeared at the jointure a third figure, unperceived until then, of the child-god Horus, the three forming the triad of a cult whose centre was at Philæ. I will show it you one day. I suspect that it came out of the mummy-case of one of the old priests. Of course I paid for these things, and Ahmed passed on the money to the men. You would have thought that the men would have kept their own counsel; but they were so elated by Ahmed's successful negotiation of these trifles, and what they had received in return, that they began to talk about it, with the result that it speedily reached the ears of their master.

'The bastinado was requisitioned to make the men confess. Ahmed was implicated. While on a visit to the village he was seized and flung to the ground. Some of Hasan's creatures, jealous of the others who had profited by the private disposal of the curios, held him down; others exposed his bare soles; and Hasan himself belaboured him unmercifully with the long lithe rods. I happened to come on the scene while this was going on, and my blood boiled within me. Snatching the rods from Hasan's hands, I snapped them in twain and flung them away, then with a kick or two dispersed the rest of the tormentors. I ordered a stretcher to be made ready, and gave instructions for Ahmed to be carried to my own tent. My business in the village was to summon Hasan to an interview with the chief. His frauds had been verified, and the time for his dismissal had come. I gave him my message curtly, and turned away.

'Then it was that my double warned me. Only a few strides had I taken when it confronted me, standing directly in my path, with a compelling appeal in the eyes of it that caused me to turn on the instant. How I knew that the double desired me to wheel about I cannot explain to you, but I did know; through the eyes of the double it flashed into my brain, and, obeying the impulse, I swung round on my heel not a moment too soon. Hasan was close behind me, livid with passion; a long sharp blade was held in his uplifted hand, and in the twinkling of an eye he would have driven it deeply between my shoulders, and I should have been a dead man. But as he was bending back to deliver the stroke my clenched fist shot out and took him with all the force I could muster squarely upon the left jaw. He staggered sideways and fell in a heap senseless. My double saved me.'

'A moment, Dick,' said I, interrupting him for the first time since the commencement of the story. 'If I understand you aright, in this appearance of the double there was something which could not be a reflection of yourself—something which came from it to you.'

'You mean through the eyes?'

'Yes. The eyes were not mirrored in some medium corresponding, say, to that which sometimes produces a certain kind of mirage?'

'No; my eyes were free from any expression of appeal. There was nothing to call up such an expression. And in the eyes of the double it was more than appeal; there was compulsion in it, as I have said—something that shot like lightning into my own brain and swung me round instantaneously. That was no reflection, Jim.'

'It increases the difficulty,' said I musingly, 'and tears my little theory to tatters. But go on, Dick.'

'There is nothing more to say.'

'What about Hasan?'

'Oh, the chief dismissed him—gave him a scathing word or two which to a sensitive man would have been very much worse to bear than my quick blow, and simply sent him about his business.'

'Has any attempt been made to reinstate him?'

'Once, and only once. In his quiet way the

chief then said that his resignation was at their service, and they drew back and apologised effusively. No mention has been made of Hasan since.'

'But he has followed you?'

'Yes, in revenge.'

'And probably to possess himself of one or another of the curios. I should certainly like to see the clasp. Do you know, Dick, I have an impression that there is something more in this than you have yet mentioned—somebody at the back of Hasan who hoped that the rifling of the tombs might result in some such find as the curious clasp. The other work was a blind.'

'But how should they know of the clasp? And what is the worth of it now except as a curio?'

'Your first question I cannot answer. The curio may be used as an amulet; that is my answer to the second.'

'I had never thought of that,' said Dick reflectively. 'It may be. Yes;' and he nodded. 'But I will let you look at it when I return. I left it with the other things in my diggings at the barrage.'

For the rest of the time that Dick was with me Hasan kept him under a baleful surveillance. We often caught sight of him as we strolled through the bazaars or drove out to one or another of the many places of interest, but he never came near enough to do Dick any personal harm. Ahmed was as watchful as ever; but Dick himself seemed to be careless, light-hearted, unmoved.

'I will leave Ahmed with you,' said he when his time was up. 'You will find him useful.'

'Doubtless, if I were willing to keep him. But I am not. I can do without him, Dick, but you cannot.'

'Oh yes, I can. You are thinking of Hasan. He will not follow me to the barrage. He dare not. I shall be safe there.'

'Are you sure?'

'Quite. Ask Ahmed, and let him decide.'

My confidence in Ahmed, and the conviction I had that he would not remain with me if Dick were in danger, led me to acquiesce in the proposal; and somewhat to my surprise, when the alternative was put to him, Ahmed decided to stay.

(To be continued.)

SOME CURIOSITIES OF POACHING.

By T. C. Bridges.

As years pass on poaching, like everything else, becomes more scientific. The old hempen net which the moucher used to hang across a field-gate at night for hares has given place to one of silken cord, and the cheap bull's-eye lantern to the more costly but more handy electric torch. Perhaps the most dangerous improvement, from the game-preserver's point of view, is the substitution of the motor-bicycle or motor-car for the old-fashioned one-horse trap. It might be imagined that the motor-bicycle would be of little use for carrying game; but only the other day a motor-cyclist was arrested near a Midland town with five newly killed hares in a box behind the seat. Parisian papers tell of well-organised gangs who raid the coverts near the French capital by the aid of apparatus worth hundreds of pounds, who have relief-funds for those injured in affrays, and who retain lawyers to defend those captured by keepers. Happily this sort of thing is still unknown in England. Gangs there are truly, but chiefly of navvies or factory operatives from the manufacturing towns, and their methods are as rough-and-ready as they always were. There is little skill in potting roosting pheasants as they perch on the bare boughs of a winter coppice, while killing rabbits with ferrets and nets is not beyond the capacity of any labourer and his lad.

The real artists in poaching are of a very different species. Some of these men boast that they can make a living with nothing but a few yards of brass wire; and he who can set a snare successfully for hare, rabbit, and pheasant has just claim to a high degree in woodcraft. But there are few who confine themselves entirely to the snare. Most of these old-fashioned game-stealers have an infinite variety of methods for attaining their ends and defeating those of the keeper.

Not unnaturally, the pheasant stands at the head of the poacher's list; it is worth more money, weight for weight, than any other game. The poacher has devised many methods of taking the pheasant. Pheasants, however tame or well fed, will wander. They travel by the same routes and end by making regular runs. If a poacher can be sure of a quiet half-hour in the covert, he slips in, sets a net across a run, sends his lurcher slinking round through the undergrowth, and presently, with a flutter and a flop, a fine cock-bird is fast in the net, next moment to be transferred to the poacher's pocket. Sometimes a noose is used instead of a net, but to set a noose for a running pheasant requires considerable skill. I once knew an old poacher who used an air-gun for pheasants. His favourite haunt was a big gorse-field which lay alongside a well-preserved wood. Here he would lie flat along the ground, completely hidden by the thick gorse, and pot the pheasants as they moved along their runs. More than once, he told me, a keeper passed within five yards of his lair, yet never suspected the presence of an enemy.

A method of taking pheasants which was more

common a few years ago than it is now was that of 'smoking.' The first essential is to discover a tree where the birds roost. Then, upon a dark, still night, the poacher goes to the spot armed with a handful of sulphur and the lid of an old biscuit-box. A fire of dry leaves is lighted upon the lid, the illumination being carefully concealed by a coat hung round it. As soon as the leaves have blazed up the sulphur is flung on the flames, and the lid held up under the bough on which the pheasants are roosting. Soon the suffocating fumes take effect. With a rustle and thump a fat bird thuds upon the ground. One after another they drop, and with luck the poacher may get half-a-dozen from a single tree.

Another favourite plan is to soak barley or wheat for some hours in warm water. When the grain is thoroughly softened the water is strained off and strong spirit poured over the wheat. The swollen grains absorb the spirit, and the doctored bait is then spread in one of the glades where the birds feed. It is an odd fact that most birds seem to like alcohol. Pheasants are no exception. The not unnatural result is that the finest birds—those which have secured the lion's share of the feast—are soon reeling about helplessly drunk. The poacher, who has been lying 'doggo' near by, has nothing to do but jump up and wring their necks.

Brutal but horribly effective is another sort of pheasant-bait. Every child has heard of the Eskimo dodge of doubling up a length of pointed whalebone inside a ball of frozen blubber and leaving the dainty for the delectation of the prowling Polar bear. Well, the pheasant-killer in question is on similar lines. It consists of soaked peas, through each of which is threaded a stiff bristle doubled into a V shape. The unhappy birds swallow the bait greedily, and the bristles, springing out straight, lodge in their gullets and choke them.

Another method of the pheasant-poacher deserves mention for its very ingenuity. It owes its success to the well-known pugnacity of our finest game-bird. A game-cock is armed with steel spurs of great length and keenness, and dropped where a pheasant has been observed to crow. The pheasant will allow no rival within his domain, and presently comes strutting out of covert. Naturally, he stands no more chance than a man armed with a paper-knife would against a Western desperado with a bowie. He is killed in a few seconds. The poacher picks up the dead bird, catches his game-cock, and moves on in search of fresh victims.

An old-fashioned way of catching rooks when they became too numerous to suit the farmer was to carry in the plough-land little conical bags of paper, with the sides smeared with bird-lime and a bait at the bottom. The same plan has been adopted with considerable success for the capture of pheasants. The bait is barley; and the bird, completely muffled by the cap which clings so tightly to its head, falls an easy victim to man or dog.

The bristle-trick already described is cruel enough in all conscience, but there is a still more brutal method which I have heard of as common in the eastern counties. This consists of a long line fitted, like a trot-line* used for sea-fishing, with short cross lines of fine silk. The main line is hidden in the centre of a hedge or other cover, and the pendants, which each carry a small hook carefully baited with worm, grub, or beetle, extend out into the field. In Greece they catch robins and thrushes in this way; in our eastern counties the hooked line is employed principally for partridges. Ducks and other wildfowl are caught in similar fashion with lines baited with dough or fat pork, and laid across the saltings on which it is their habit to feed. But any ordinarily humane person who has once seen a wretched bird fluttering, hard-hooked, as I have seen a swallow accidentally caught on a trout-fly, will agree in condemning this cruel plan of 'fishing' for birds.

Speaking of taking wild-ducks reminds me of a delightful story which I found a year or so ago in an American paper, and which relates an exploit of one Hiram Sparks, said to be the most notorious poacher in Wisconsin. Thunder Lake is a great resort for wild-duck, and one of the most carefully preserved spots in the state of Wisconsin. Early one morning Sparks was observed by a keeper—'wardens' they call them in the United States—engaged in the apparently harmless occupation of flinging handfuls of food broadcast into the water. Soon the birds collected in 'rafts' and gobbled up all the dainties which Sparks had scattered. Suddenly a loud report was heard, and as the ducks rose in alarm at the sound a hundred other explosions volleyed out, and dead ducks rained back into the water. Amazed at this extraordinary episode, the game-wardens investigated, and found that Sparks had mixed dynamite with the food which he had thrown out. When the ducks had filled their crops with the explosive he fired a gun, and the concussion exploded the charges which the birds had swallowed. One hardly knows which to admire most—the Münchhausen-like ingenuity of the fabricator of the yarn or the impudence of the journal which endeavoured to make its readers swallow such a concoction as cold fact.

In an open field you will often see small pieces of brushwood stuck into the ground at intervals. These are set by the keeper for the purpose of hooking up the nets of night-poachers for partridges. Partridges roost upon the ground, and by means of a long, light net dragged across the grass by two men a whole covey is often captured at one swoop. This form of poaching is only possible on a dark night, and at such a time the poachers cannot, of course, see the branches, and therefore they get their nets entangled in them. But some have nowadays taken to lining the ground-side of their nets

* 'Trot-line' is also known as a 'boulter' or 'speller.' Vide *Encyclopædia of Sport*, vol. ii. p. 324.

with some stiff glazed stuff. A net so protected will slide over most obstacles.

About the most cruelly ingenious method of poaching which I ever heard of is practised in the West Indies. All through these islands the quail takes the place of the partridge as the principal game-bird. Now, the quail, like most of its kind, is very fond of a dust-bath. The negro, who greatly enjoys a dish of roast-quail, knows this. He seeks out the little 'dust-pits' where the birds 'wash,' and scatters cayenne pepper thickly over the sand. The burning powder blinds the poor little bird, which is thus easily caught. The West Indian negro is also a great fish-eater; but, being lazy to the core, he will not even take the trouble to use rod and line. Either he explodes a stick of dynamite over a pool and so slaughters everything in it, or he makes use of the bark of the dogwood-tree. This bark has a powerful narcotic action, and after a few pieces have been left to soak for a time in one of the still pools of the mountain brooks the mullet rise to the surface and float there helpless.

A similar, but worse, trick is often employed in England, to the ruin of stretches of fine trout-water. Conscienceless ruffians will fling a bushel or so of gas-lime into a brook, killing every fish big and little, and poisoning the water for a long distance down-stream. In Ireland regular raids are often made upon salmon rivers during spawning-time. A score of men will gather by night and attack some gravelly shallow where the fish are spawning. The poachers are armed with torches and spears, and the destruction is terrible. It is a queer fact that these people, and also some of the poachers on Devonshire streams, will just as soon eat a foul old kelt as a fine fresh-run salmon. Salmon are also snatched by means of a treble hook as big as a small grapnel, fastened to the end of a line which even a twenty-pounder foul-hooked is not likely to break.

Fishing on the river Lea in Essex, I once noticed a barge coming down towing behind it a small model boat. Supposing it to be a toy of one of the bargemen's children, I took no further notice. Later I was enlightened by a resident as to the real purpose of the 'toy.' He told me that if I had watched long enough I should probably have seen the boat hauled in, and behind it a long trolling-line carrying a spoon-bait. The toy boat is a blind to hide the trolling-line from the eyes of keepers or conservators, for under Bylaw XI. of the Conservancy this form of fishing is denounced as absolutely illegal.

OCCASIONAL NOTES.

'PELORUS JACK,' THE DOLPHIN PILOT.

By Mrs Leo Myers.

THE Parliament of New Zealand is famous for so many original acts of legislation that an Order in Council protecting a dolphin—familiarly known as 'Pelorus Jack'—is no fine fish-story, but a fact to be accepted in good faith.

You can see him as your ship enters Pelorus Sound going through the French Pass on the Nelson-Picton run. How he knows of the approach of a steamer is a mystery to man; but he meets every ship that goes through the French Pass with the regularity of a time-table—a self-constituted pilot who navigates with business-like importance round the hull for a quarter of an hour and then disappears. He is always alone, and seems to break the monotony of his isolation by visiting all incoming ships.

All, with but one exception. It is related that he received a nasty bump while disporting himself round the steamship *Penguin*, and bears the scar of the encounter to this day. This hurt his dignity as it pained his side, and left an indelible resentment which 'Jack' revenges by cutting the *Penguin's* acquaintance and wiping her from his visiting-list.

As 'Pelorus Jack' is the only fish of his species in New Zealand waters, his exact classification has been the root of a hundred arguments. At first 'Jack' was classed in genus Beluga or white whale, then again as genus *Ziphius cavistrostris*; but his identity has been finally made clear in classing him as of the Cetacean order of the *Grampus grisens* species, commonly known as Risso's dolphin, and under this name—Risso's dolphin—his life is uniquely protected by a special Act of Parliament. Sailors, who accord him unbounded admiration, and the travelling public, who are amused by his sagacity, still dub him 'Pelorus Jack.'

He is believed to be quite harmless, concentrating his ichthyological traits into almost human instincts of discernment and punctuality. His colour is slaty-gray and mottled, appearing silvery-white in the sunshine. His length is estimated to be from twelve to sixteen feet.

Though 'Pelorus Jack' has been observed by seafaring men on this particular run for about twenty years, he may still have a century before him, if not behind.

THE SECRET OF THE RED HANDS.

So many things around us proclaim the universal brotherhood of man that one wonders if any can doubt for a moment the intimate relationship that links all humanity, whatever the race, the age, or place in which it took form, and whether

cultured or savage. Without going into the question of mere bodily likeness, we find there is and has been always a certain resemblance in mental workings; for not only is there that extraordinary acknowledgment by all races (or nearly all) of some superior Being, either good or evil, but we are constantly faced with surprising resemblances in manners and customs between peoples so remote that they never could have had any communication. Life is, indeed, a puzzle which we are disentangling little by little, with the aid of clues. Faint and involved as these are, seeming to make the puzzle more perplexing, yet gradually the guiding threads are being pieced together, surmise is slowly giving place to certainty, and line by line the history of the world is being read. Every now and then discoveries in the study of anthropology are made which confirm the suggestion of our wide relationship, that cause distance to dwindle into nothingness and time to shrivel like a burnt leaf. They force upon us the resemblance even in human beings who lived in prehistoric days on opposite sides of the globe. M. Félix Réynault, the French student of man and his ways, has just found one of those surprising clues that link the whole of humanity in one long chain, having discovered on the inner walls of one of the Gargas Caves in the commune of Aventignan, in the department of the Upper Pyrenees, a curious mural decoration. It consists in small painted red hands similar to those found on the side of the great gallery explored before by MM. Carthailac and Breuil. Those interested in such things will at once remember that similar designs have been found in caves in California and Australia, giving evidence of prehistoric habitation. Indeed, the Australian native of to-day makes similar patterns in a manner which is more than probably precisely that in which these far earlier designs were produced. He spreads his hand flat on a wet stone, then fills his mouth with a red powder which he blows over and around the hand, leaving, when that member is raised, a distinct outline in red. The colour used is very durable and lasts for centuries. It is curious to reflect on the similarity of primitive artistic taste which has existed between the inhabitants of such far-distant places as the Upper Pyrenees, Australia, and the western side of North America.

IRISH SOIL FOR AUSTRALIAN SNAKES.

In a London newspaper of last year it was stated that an Irish resident in New South Wales, whose farm or selection was infested by venomous snakes, had 'telegraphed to Ireland for a consignment of Irish soil to be sent to him, so that he might have it spread about the vicinity of his dwelling.' This is doubtless the revival of an old but true story of the importation of a shipload of Irish soil into New South Wales. Some time before transportation ceased—about 1836—the well-known Wentworth family built a stone mansion on the south shore of Sydney Harbour, near the Heads, and named it Vaucluse; but after a year's occupation the family became so terrified at the number of deadly black and brown snakes which infested the beautiful grounds, and often got into the house itself, that serious thoughts were entertained of abandoning the mansion. The assigned servants went about in terror, and at night every door and window was carefully closed. But snakes still got entry in some way. Then it was proposed that the whole lower course of the walls should be sheathed with glass to prevent the reptiles from ascending. This, if carried out, must have failed; and then came the happy inspiration to have soil brought from Ireland, and to form a complete enclosing ridge around the entire estate. If the writer remembers aright, there were two cargoes brought, each in a convict transport, one of which was named the *Britannia*. She ought to have been named *St Patrick*. Both ships loaded in Dublin, and the precious soil was duly deposited around Vaucluse. But, alas! the snakes 'didn't care a cuss,' and came crawling about as usual. Nevertheless many of the emancipated Irish convicts who were living in the vicinity firmly believed in the virtues of the earth from the 'ould sod,' and begged for some of it to protect their own dwellings. The writer's grandfather, who had a large estate at St George's Head, on the opposite side of the harbour, and employed a number of 'assigned' convicts, several of whom had been transported for sedition, could not prevent them from taking a boat at night-time and stealing a few bagfuls of soil occasionally. And the writer's mother well remembered that when she was a child she was always taken by her Irish nurse to play in an especial part of the garden, which was made safe from 'sarpints' by a circle of ground about fifty yards in circumference, enclosed by a ridge a few inches high of the soil from Vaucluse.

THE MIGRATION OF BIRDS.

The second report of the committee appointed by the British Ornithologists' Club to study the migrations of British birds is (says *Bird Notes and News*) a volume of great interest to all students of birds and their ways. It gives an account, compiled from the observations of a large number of observers, of the immigrations during 1906 of thirty-three of our commoner summer residents; and the notes on each species are accompanied by a map showing when and where the birds arrived in this country and how they gradually dispersed to their accustomed haunts. The assistance of more observers is urgently needed. Any one willing to help should communicate with Mr J. L. Bonhote, hon. secretary to the committee, at 3 Hanover Square, London, W. It appears from the report that Hampshire is the county most favoured as a point of arrival (this county receiving stragglers from flocks arriving both in Devonshire and Sussex, and thus forming one of the main landing-places along

the south coast); Devonshire, Dorset, and Sussex come next, and Kent last. Birds actually arriving on the east coast were few, but the evidence points to a considerable emigration from Norfolk of birds which arrived in Devon or Hampshire and took a north-easterly route. The records extend from the middle of March to the first week of June; and on only five days between 16th March and 31st May was no immigration recorded on our coasts, the season of 1906 being noticeable for the prolonged period during which many of the species arrived. The earlier part of April brought, it appears, exceedingly few species, but the 'rush' began on 18th April, and from that date till the end of the first week in May the birds poured in. 'In the case of many species, one wave followed another so closely that they practically arrived in a continuous stream for a week, ten days, or longer.' The largest number of species actually arriving on a given day (as noted in the report) was thirteen on the 18th of April, nine of which came in together to the Isle of Wight.

LORD ELCHO'S NARRATIVE OF THE 'FORTY-FIVE.'

To the already large library of works on the '45 there has been added *A Short Account of the Affairs of Scotland in the Years 1744, 1745, and 1746*, by David, Lord Elcho (David Douglas). It is printed from the original manuscript at Gosford, with memoir and annotations by the Hon. Evan Charteris, and is a valuable addition to our authorities upon the period. The notes are accurate and full. Lord Elcho left two manuscripts: a journal in French (drawn upon in the introduction), and a narrative of events (1744-46) in which he was an actor, here printed entire for the first time. The illustrations include portraits of Charles Edward and Lord Elcho, and plans of the battles of Prestonpans, Falkirk, and Culloden. Robert Chambers, Andrew Lang, and Ewald seem to have been aware of Elcho's narrative; Scott drew directly upon it for this period in *Tales of a Grandfather*. Lord Elcho died an exile in Paris in 1787, and but for his attainder would have been fifth Earl of Wemyss. He was at Rome in 1741, and left deeply committed to the Jacobite cause. He was a daily visitor at the Villa Borghese, and describes the Chevalier as 'a prince most affable, most well-informed, and most sensible.' The amusements of Prince Charles were playing golf and shooting small birds; he was a capital marksman when he came over to Scotland; but 'he appeared to have no tastes save for hunting and music, and had no conversational powers.' Lord George Murray gets the responsibility of encouraging the Prince in his ill-fated enterprise. When Elcho joined Prince Charles at Slateford, near Edinburgh, he brought fifteen hundred guineas with him, a sum which he afterwards tried in vain to recover. He was in all the battles, and acquired a reputation for brutality and cruelty after Prestonpans. The description of the bloodless entry into Edinburgh, of the Court at Holyrood, and the camp at Duddingston is extremely interesting. A very graphic picture from the Whig standpoint of the doings of the Highlanders in and around Edinburgh will also be found in Mr C. E. S. Chambers's recently published *Woodhouselee Manuscript*. The writer of this quaint and characteristic narrative observed the crowd in High Street at the 'comic farce or tragic comedy' of proclaiming James VIII. The soldiers had guns of various sizes, some of enormous length, tied with packthread to the stock, some without locks; others had swords instead of guns over their shoulders; one or two had pitchforks or bits of scythes upon poles, with cleeks and Lochaber axes. This corresponds with Elcho's description of the armed mob as it appeared south of the Forth, where much less help was forthcoming than was expected. Elcho, who was principal aide-de-camp to the Prince, accuses Charles of self-will, impatience of advice, selfishness, and obstinacy; of showing an insane suspicion of Lord George Murray, and giving more of his confidence to the Irish officers than to the others. The failure of the '45 was largely due to the British navy, which prevented French assistance and kept the army provided from the seaboard. After all, it was only an episode in our national life, but one that has its romantic as well as its sordid side. It is this last which is most apparent in Lord Elcho's narrative.

A GRANDFATHER CLOCK.

For centuries, within a kitchen quaint,
It ticked the time,
And hourly waked to music with its faint
And drowsy chime.

And now, with other beauties fair and old,
It prides my den,
And tells for me the tale which once it told
For better men:

Men whom I love to dream about, as when—
The day's work done—
They watched the winter fire. Did hours run then
As now they run?

The old clock knows, for he has seen it all.
They came and went,
Pausing to take such joy as might befall;
Parting content.

The tales they told, the jests they found right good,
I may not know;
For though my clock might tell me, if he would,
He won't. And so

I e'en must be content to muse and guess.
And yet, mescems,
'Tis not all loss; for speaking might no less
Dispel my dreams.

SIXTH SERIES.

THE HEART OF THINGS.

By Henry Leach.

London, *Dec. 20th.*

IT seems sometimes that when the literary man of historical bent is waiting for the crystallisation of some other idea his fancy flies to the retreat from Moscow, to the escape from Elba, and to the 'last phase' at St Helena, and forthwith he prepares a title-page on which he writes 'Napoleon.' However that may be, it is certain that the already vast Napoleonic literature grows amazingly, and once again the number of new books dealing with the life and character of the great Corsican has been a feature of the present publishing season. One cannot glance over the book-advertisement pages of a newspaper or periodical without observing the announcements of new works concerning the man of the most fascinating personality of modern times being issued almost simultaneously from several different publishing houses; and the reviewers are constantly enabled to group three or four of them together and to deal with them in a batch. The output of such literature this winter has been greater than ever, and it is plain that there is a great and unceasing demand for it. The study of the character of Napoleon seems to interest the present generation more than it has done any other. Not only in the way of books alone is there what might be called a good market for Napoleon in these days. It is next to impossible to look into the window of a picture-shop without seeing that grim, sad face, with a gloomy disappointment marked upon it and eyes staring back into an awful past—prints of James Sant's most popular picture, 'The Last Phase.' In any emporium of *objets d'art* you will discover Napoleon statuettes of all kinds and sizes; in the stationers' shops you may buy paper-weights with Napoleons on horseback for handles; and the people who deal in electric lights offer you fancy arrangements of a Napoleon, with the Edison bulb attached somewhere to his accoutrements. Nothing satisfies like Napoleon. There is a meaning behind all this which sociologists and others who study the tendencies of the present age have no doubt reflected upon. Every man knows and feels that this is an age of ruthless materialistic struggle in which philosophic ideals are at a discount, when the standard of success is represented almost only in cash and kind, and when there is the greatest public admiration, almost esteem, for the strong men who have crushed the weak, and when the weak endeavour to crush those who are weaker than themselves. Such observations as these might savour of triteness were it not for the fact that the strain of the financial and commercial situation at the present time, the tension throughout the world of higher politics, and the advance of Socialism in every country, and most noticeably now in Britain, have plainly accentuated this general sentiment, have made men of all classes feel more that the character they need to help them in the fight and to raise them to eminence among their fellow-men is not the noble, the generous, the sublime which was an ideal not long ago, but the selfish, greedy, ruthless, mercenary, that which struggles unceasingly and avariciously for an ambition which, after all, is almost meaningless. The best of present-day altruists who, with much ability and scope, has done fine work for the masses of the people is hardly regarded by those masses as such a fine example of life and method as an American millionaire or a financial magnate who pulls the strings in the City of London. This perhaps is why the spirit of Napoleon seems to brood over the manners and the tendencies of the time, and why the man who made a river of blood run through Europe comes near to being canonised less than a hundred years afterwards and is secretly worshipped as a demigod. Financial panics, unrest of Governments, thrones in danger, Socialistic aggression, revolutions pending, oppression, starvation, triumphs of trusts, millionaires increasing, ships in the air, and in every street the noise and smell of nerve-destroying motors to give hurry and speed in the race of life—Napoleon! Surely he must be canonised in an age like this. Appropriately

[*All Rights Reserved.*]

and inevitably we have at the same time the increase of agnosticism and indifference to the beliefs and ideals that have been preached for nineteen hundred years. There may be murmurings on suitable occasions, but hearts recede farther and farther away. In fifty years a bond of sympathy that had held fast through ages has been perceptibly weakened. It is difficult to contemplate Calvary when on the top of a motor-omnibus.

* * *

Another year will almost have run its course by the time these lines are published, and in one way and another the world that reckons by the Christian era will be preparing for the beginning of a new period which, with that state of anxiety now prevailing in the great world of higher politics and in commerce, is almost sure to mark great changes and to bring about disruptions of serious consequence. When there is a time of general anxiety the tension is felt in London as it is not and cannot be anywhere else, and yet it is a curious thing that large and important sections of the people constantly enter upon a period of severe strife and likely difficulty in a mood of reckless abandonment to pleasures of a peculiarly artificial and somewhat freakish character. The good old custom of the watch-night service still has its vogue; and in the heart of London, as in other places, the chapels and the churches hold congregations of meditative persons who are bended on their knees while the twelve chimes mark the great division and the admission to a blank space of doubt and hope. But ministers can tell you that as time goes on the popularity of these services much diminishes, and it may not be far off when they will almost cease to be held. It is only a little gain on the other side that the rowdiness that used to characterise the crowds that assemble annually for an hour before midnight on New Year's Eve outside St. Paul's Cathedral, and organise the least creditable and edifying festival that ever takes place within the City, has shown a considerable diminution in recent years. In other classes of society the freakish tendencies of the time exert themselves strangely on this occasion, and it is evident that our New Year's Eves are becoming Americanised, just as the old family spirit is departing from the Christmas festival. An appreciable portion of London now spends its Christmas in hotels at the seaside, where at some of the popular caravansaries they will tell you that every room was engaged for Christmas week by the end of last September. But the Americanisation of the old English method of keeping the New Year's Eve—if it is an Americanisation, as it looks to be—consists in experiencing some new kind of sensation at a leading London restaurant, and there are few of such restaurants that do not now prepare some special programme of novelty for the accommodation of moneyed patrons who have what may fittingly be called a weakness for this sort of thing. The ingenuity of managers is leading them to more fanciful schemes each year, so that in these days the New Year's Eve arrangements are taken in hand weeks or even months in advance. The peculiarity of the results may best be indicated by one or two examples. At one of the most famous restaurants in the world last year the attraction was what was known in advance as the 'mysterious aeromobile,' and seats for the midnight supper at which it was to be exhibited were taken in advance by over a thousand people. And the 'show' consisted of a set of rails running round the fine apartment on which an artistically embellished contrivance, some seven feet long, designed to represent a combination of a motor-car and an air-ship, was made to run. The car set out from the foyer upon its journey at two minutes to twelve, having as passengers two ladies who were supposed to be symbolical of the New Year. Just as the clock struck the first note of twelve it descended into the central avenue and ran among the guests, the New Year ladies showering gifts on all sides. At the moment that this aeromobile came to the floor a miniature of an old four-wheeler clattered away—the last, as it were, of the old year. And then, with the calendar marking the 1st of January, supper was resumed. At another fashionable restaurant the pretty idea is annually conceived of arranging for the diner's attention to be attracted by a distant sound of trumpets, while at intervals a peal of church-bells is heard ringing dimly far off. During the last few seconds of the reign of the old year the sounds of the trumpets become louder, and at last, on the stroke of midnight, the royal trumpeters of the Guards enter the *salon* and sound a fanfare as if proclaiming the accession of the New Year. Three earls, several minor peers, and an unimportant sultan have been included in one of these restaurant New Year's Eve parties. London is essentially a place of strange contrasts, and with a feeling abroad that this important point in the calendar 'must be celebrated somehow,' one cannot be surprised at the tales one hears of strange gatherings of a private and special character. The one that most fully deserves this description is best mentioned by way of contrast to the happy and pretty, even if somewhat frivolous, assemblies that have just been mentioned. It was nothing less gloomy and weird than an undertakers' party, at which the dining-room was draped in black, relieved occasionally by a few wreaths. There was a black border to the tablecloth, and the design of the arrangement in the middle that held the flowers need not be specified. 'Health to ourselves and prosperity to our businesses in the New Year' was a ghoulish toast that was well received, while certain members of the party would sing such songs as 'The Gravedigger' and 'Down among the Dead Men.' It was surely an omission that there was no poison in either soup or wine. On the contrary, the dinner was an excellent one, and such a hilarious time was spent that on the following morning some of the

overnight revellers were for once in a way given to contemplation of their becoming customers to each other.

* * *

One of the last matters of speculation in many quarters at the end of one year, and certainly the first of general interest the next morning, so far as the contents of the newspapers are concerned at any rate, is as to the persons upon whom the Sovereign is pleased to bestow titles on this special occasion, and the nature of those titles. The last birthday-list was not an interesting one, which makes it all the more likely that that which is forthcoming will be. Perhaps it is as well that there should be a cessation in the flow of peerages when there seems to be no good reason why anybody should be made a peer; and as for baronetages, has not the continual hammering away at the quality of some of those in existence cast the order generally under something of a cloud which will not be altogether removed until the legislation which has been suggested and is expected becomes an accomplished fact? A little while since a departmental committee was appointed by the Home Secretary to inquire into these matters, and it found among other things that the number of cases in which the title of baronet has been assumed either wrongfully or upon a very doubtful basis is approximately 5 or 6 per cent. of the entire baronetage. It may interest some readers who have friends who are ambitious of having 'handles' to their names to know that, as the law seems to stand at present, there is nothing in the world to prevent them from putting 'Sir' to their names and 'Bart.' after them, and that nobody can prevent a person who so decorates himself from remaining in possession of this self-assumed title unless he makes use of it to obtain cash, goods, or credit under false pretences; and even if he is convicted of doing that, he can still cling to his 'Sir.' The committee just mentioned recommended as the best means of dealing with this unsatisfactory state of affairs that legislative action should be taken against all those persons who had taken the title to themselves without proper authority, said committee having an idea that the machinery already in existence for dealing with peerage claims might be found sufficient for the purpose. It was suggested also that the King should issue a command that a roll of real baronets should be kept at the Home Office, and that no person whose name was not on that roll should be received at Court as a baronet or should be described as such in official documents. At present it is certain that some people who are not baronets pass in the best society as such, and that nobody would dare to refer to them in any other way in any kind of document.

* * *

This is essentially the season of charity and the necessity for it; and it is a good thing to remember that in a report which they issued not long ago the Charity Commissioners observed, in defence of the policy that they had been pursuing, that 'there is every reason to believe that never has the tide of charity flowed with such pace and volume as now.' Within the brief space of four years new charities have been established for other than educational purposes to the number of over eleven hundred, and their cash value considerably exceeds two and a half millions, and produces a yearly income of some eighty-five thousand pounds. It is estimated that, at the present rate of creation, in forty years the number and value of charities will be about doubled. The bulk of this new money for charities has gone to hospitals, who have taken three-quarters of a million of it; while, in spite of all that has been said and written by experts against the wisdom of doles, relief of the poor in money or kind comes next—though a long way behind—with a total sum of over two hundred thousand pounds. Then, again, last year a sum of nearly six million pounds was left upon trust for charitable, religious, and other public objects under ninety wills which disposed of estate of the total value of twenty millions. The total of the bequests was more than double the annual average of the last twenty years; whilst the proportion of charitable bequests to the full value of the estates, being about 30 per cent., was unusually high. Such handsome figures may not be reached when this year's wills come to be analysed in a week or two from now. Nevertheless this dying year has also been a good one for the charities, despite the general complaint that times are bad. It is a gratification to the philanthropic bodies that bequests that reach them now are mostly from fortunes made in the richer years when there was less 'depression,' fewer and smaller taxes, fewer trades-unions and strikes, and less grumbling. London itself is a very charitable community, as is proved constantly on special occasions throughout each year. Apart from that feature, out of over nine hundred charitable institutions which have their headquarters in London, seven hundred and thirty-one made a return of the money they had distributed last year and where it had been placed, and this showed that they had been the means of dispensing within a period of twelve months no fewer than seven and a half million pounds. An analysis showed that in this case nearly three millions had gone to home and foreign missions, and only a little over one million to hospitals, nursing institutions, and the like. There is this to be said for the London charities, that they are not made for show, and indeed it would surprise even London to know what good is done collectively by stealth and with no parade of virtue. Here and there are little societies of men existing solely for charitable purposes, the members of which are almost under a bond of secrecy with each other not to disclose to the outside world what they are doing. As an example, one might quote a little organisation which is

entitled the Brotherhood of the Cheerful Sparrows. This is a society which was formed some years ago by a few City gentlemen for the relief of distress without public inquiry, in cases which might come under the personal notice of any member of the brotherhood. There are now some twelve hundred brethren, who each subscribe half-a-crown a year, gather donations from their friends, and once in a twelvemonth assemble for a banquet which has the good excuse of adding considerably to the money available for distribution. Thus it happens that about two hundred pounds or more is distributed every year among the most deserving cases which are of such a character that they would probably escape the notice of other charitable organisations.

* * *

It is often said that the great Metropolis is the best place in the world for one to lose one's self in, to hide away from all one's friends and acquaintances, and it is a true thing to say. Yet, paradoxical as it may appear, it is the easiest place in which to find one who has been lost, and not a week goes by but the knockabout Londoner with an extensive list of country and foreign acquaintances finds occasion to remark with more or less simulated surprise that the town is a very small place after all, and that it is difficult to avoid people whom one has not seen for years whenever one ventures beyond one's own doorstep. The writer wishes to quote two personal experiences of the most recent happening. After some weeks' absence from London he turned in one evening to a Turkish bath establishment in the west, and while undergoing the cooling process he glanced over the pages of a literary journal and made a note of a question that he intended to put to a certain London publisher. The next minute that publisher, clothed in a white sheet only, greeted him from an adjoining couch. The writer remarked upon the curious coincidence; whereupon the publisher related the story of one far more remarkable that had happened at one of his recent visits to that same establishment. He had gone there with a friend, and the conversation during the hour of rest turned upon a certain individual whom the publisher's friend said he had not seen for thirty years, and whom he would very much like to discover for the furtherance of some business idea that he entertained. While he was speaking this very man came up from the hot rooms, and, acquaintance having been resumed, the way was clear for the discussion of the business. That is experience number one, and it is what might be called a double one. The other occurred the same week. Some friends of the writer were up in London together, one from Devonshire and the other from North Wales, for the mutual purpose of attending a function at the Mansion House. At the function they discussed an intimate friend residing in Yorkshire, and regretted missed opportunities of a brief reunion. The next afternoon the writer and his two friends agreed to spend an hour before dinner in walking through the new Roman Catholic Cathedral at Westminster, one of the party being closely interested in architectural matters. It was six o'clock, and the aisles of the cathedral were in almost total darkness, a dim glimmer from a few candles being almost the only illumination. The three were nearly groping their way back towards the entrance, when they were conscious, more as if by telepathic communication than in any other way, of the presence of some one whom they knew. Then they stared into a face, and it was that of the old acquaintance whom they had most desired to meet the night before, but whom they imagined to be more than two hundred miles away. Neither party knew of the other's presence in London, much less of the intention of either to spend those few minutes in strolling through one of the least-frequented places in the whole Metropolis, than which as a place of temporary hiding none better could have been chosen.

A PAWN IN THE GAME.

CHAPTER VI.—IN PARIS.

As the diligence drove through the gate into Paris it was a very tired youth who stared with very tired eyes at the scene before him. The Paris of 1784 was a city with a girdle of lofty walls pierced with gates. The wall, it is true, was intended not so much to keep out a foreign enemy as to prevent the smuggling of uncustomed goods. It was a collectors' barrier, and every street that pierced it was crossed by a palisade, with an opening to admit one vehicle at a time and a sort of sentry-box for the tax-collector. Paris, in a word, was bound in a ribbon of stone, with ninety-six of such gates for eyelet-holes.

The diligence entered by the Rue Montreuil. It was November, and the fast-darkening gloom of the winter evening lay on the foul and narrow streets—a gloom that deepened into night under the shadow of the beetling houses, with their projecting upper stories, irregular gables, and huge creaking signboards. The street was a mere stony gutter, lowest at the centre. Footpaths were not yet invented; and Jean wondered at the round, clumsy pillars that at irregular intervals projected from the sides of the houses. *Bornes* the friendly driver told him they were named, and he guessed they were intended to protect the foot-passengers from being crushed by the passing vehicles against the walls.

The shop windows were low. Openings at the

level of the streets led into dark cellars, round which dirty children played, and into which, as the wheels of the diligence rattled by too closely, they disappeared like frightened rabbits. Every now and again the diligence passed a shop from which trickled across the wet stones little streams of blood. These were butchers' shops; and thus, as if in dreadful and unconscious prophecy, the streets of the Paris of that day were scribbled with hieroglyphics of blood.

As they drove westward Jean recognised some of the more famous buildings. Down a narrow, crooked street to the left he caught a glimpse of the towers of Notre Dame. A sudden curve of houses rising above the mosaic of roofs showed where the Pont Neuf stood. Near it, a great stone horse and its rider marked where the Pont Royal crossed the Seine. Madame Laurente's house was in the Rue de la Grenelle, a side street opening into the Rue St Honore, and was only reached through a tangle of narrow alleys and filthy houses. The house stood back discreetly from the street, and showed in the dim twilight a square of blackness, in which the lighted windows shone like eyes.

The major-domo—M. Duclos, as he was now called—met Jean as he entered, and somehow a chill ran through the boy's blood as he caught a glimpse of that dark face with its frosty eyes and look of mystery.

Madame was entertaining to-night, he told Jean. 'She will see you to-morrow. You must hide yourself, or I will hide you; for it will not add to her pleasure to see you. Did you expect,' he asked quietly, in answer to Jean's disappointed look, 'to step from the punishment-cell at Brienne to madame's drawing-room?'

Jean was too tired and wretched to protest against such a reception, or even to resent it. The major-domo's accusing eyes chilled him. They gave him a deeper sense than ever that he was a criminal. He was led, with something of the air of a detected thief about him, up the narrow stairs to a little, dark room high in the roof. He sat there, tired and cold, till a mingled tempest of despair and anger awoke in him. He was under what was his father's roof, and he sat hungry, neglected, forgotten.

Presently the sound of many feet, the murmur of voices broken now and again by a merry tinkle of laughter, stole up to him. Jean opened the door of his room, crept across the dark corridor to the head of the stairs, and looked down. Madame was sweeping down the stairs, a figure of grace. He saw the gleam of her white shoulders, the sparkle of jewels. Her voice rose to where Jean stood, unexpressibly soft and sweet. She lifted her eyes to the tall figure of the gentleman at her side, and Jean saw the flash of her white teeth as she smiled. The tired, hungry, unwelcome boy leaning over the stairs looked with envying eyes at the graceful figure below him, a foam of lace and silk, out of which rose the bright upturned face, from which the eyes shone like stars.

As Jean looked, a little girl ran with swift, pursuing feet down the stairs. It was Denise, Jean's playmate during the two years of his father's marriage. Jean leaned over the balustrade and called to her; but the swift figure had vanished, and he stood in the darkness whispering her name over and over again: 'Denise! Denise!' His heart ached for companionship.

He crept back to his room, and, broken with fatigue, flung himself on the bed and slept. But through the chamber of his dreams the dark features of the major-domo, the upturned face with starry eyes of madame, and the slender, swift little figure of Denise chased each other.

When Jean awoke it was still night, the rain was beating on the little attic window, and the roof shook to the harsh November wind. He was hungry, cold, unwashed. Sitting in the gloom of the cheerless room, he felt as if he were naked to the wild night. Its blackness, shaken with storm, lay on his imagination and half-froze, half-terrified it.

Every one seemed to have forgotten him. He tried the door, but it was locked. The chilly hours went by, the cold gray dawn came and grew to a noon as gray, and still there was no sound of a coming footfall. At last, pricked with hunger, the boy grew desperate. He commenced to beat furiously on the door. For long he beat in vain. Then a footstep—deliberate and unhurrying—drew near his door and paused. Somehow Jean knew it was the major-domo, and he pictured the frosty eyes, with some unread and deadly purpose lurking in them, and for a moment he was chilled with fear. Then his courage, hot with the fire of anger, awoke again. He thumped the door more furiously than before, but the steps passed away with a leisurely deliberation which set the boy's wrath in a fresh flame.

If the major-domo meant to tame him with hunger the plan was a mistake. Jean's spirit grew fierce. He looked round the room. In the fireplace was an iron fire-dog on which a pair of tongs leaned. He seized the fire-dog, lifted it in his vigorous young arms, and dashed it on the panel of the door. He repeated the performance again and again until the panel began to yield. Then suddenly the door opened. The major-domo stood there.

'You begin well,' he said coldly. 'This is your first morning, and you are breaking madame's doors.'

Jean was a sufficiently desperate figure. His face was dirty; his hair stood up defiantly; the fire-dog was in his hand; the broken door bore the signature of his fury. He scorned to say he was hungry.

'I was locked in,' he said sullenly.

'Come,' replied the major-domo; 'madame will see you. You may keep your weapon,' he added with a satirical smile.

Jean felt himself like some outcast as, with dirty

boots, blackened hands, and sulky brow, he entered madame's dainty sitting-room. She looked at him. The bright eyes were hard beneath the level brows.

'*Ah, quel bête!*' she said softly.

The boy caught the words and flushed; his hands instinctively gripped the unlucky fire-dog with an impulse of anger; his lips grew stubbornly silent.

The major-domo told his story. He had thought it prudent to lock the lad in his room, and in the morning he had found him breaking the panels of the door with the fire-dog which he still grasped in his soiled hands.

Jean had no defence to offer. He had a boy's gift for sulky and inarticulate anger. A look which Jean could not understand was in madame's dark eyes as they rested on the lad's figure. Was it pity, or hate, or remorse, or a combination of all these emotions? Then she seemed to dismiss him with an impatient gesture out of her life.

'Do as you will with him. Let him live with the servants, or anywhere else; only keep him out of my sight.'

Jean felt the blood run in a fresh wave of anger through his veins. It was his father's house, where he had once lived like a prince, with every whim gratified. Now he was dismissed to the company of the servants. A touch of gentleness in madame's voice, a glance of kindness from her beautiful eyes, would have melted the boy and made him her slave. But the strange looks which passed betwixt madame and her major-domo froze him. The cold dislike in her eyes awoke in him a passion of bitter feeling.

Just then there was a sound of soft, light feet which set the boy's nerves tingling with a new sensation. It was Denise.

She ran to her mother's side with a merry laugh; then she turned. Her quick young eyes dwelt wonderingly on the dirty figure of the boy, with the unhappy fire-dog still in his hands. 'It is Jean!' she cried; and a flash of delight, mingled with wondering pity, lit up her face. In an instant her arms were about his neck, her warm lips were on his dirty cheeks.

Now, a boy does not enjoy being publicly kissed, and madame, with the major-domo, made a very unsympathetic audience. Yet the voice, the touch of Denise overcame Jean.

'Denise,' said her mother with chilly deliberation, 'you forget yourself. Jean is no company for you. He has disgraced himself; he has been cast out of Brienne. He has been only a night here, and look at him. He has begun to break down the doors of the house.'

'Have you been a whole night here,' asked Denise breathlessly, 'and I did not know?'

Two pairs of rueful eyes questioned each other and read each other. There is a predetermined and eternal harmony which knits certain sounds together, and why should human hearts be less responsive than air-waves? Certainly some sudden, unreasoning, mystic affection that comprehended everything, and told everything, knitted together the boy and the girl. Denise was plucked away, and Jean was led mutinously into social exile; but the last look of his playmate haunted him. Her eyes shone like twin stars in the dark sky of the unfortunate boy's memory.

(*To be continued.*)

AUSTRALIAN RAILWAY TRAVEL.

THE clock nears half-past four, and Adelaide station is full of animation, for in a few minutes the inter-state express will start. Here comes the genuine back-countryman, tall, blue-shirted, with neatly rolled blanket over his shoulder and billy in hand. He is going the first hundred miles by rail, and will then start out on a great tramp into the interior, sleeping each night in the open.

Yonder middle-aged man in frock-coat and silk hat is a senator. There are always plenty of politicians in the train, for years ago Australian legislators liberally decided that they themselves should travel free. Young farmers, black-skinned from much sun; dainty-looking ladies, fresh from the European mail-steamers, who have not yet realised that they are on firm earth again; commercial travellers in abundance—we are, on the whole, a more free and friendly throng than any you would see on a London platform.

The train has only two classes, and the wise man secures his sleeper in advance. There is nothing to complain about in the carriages during the first part of the journey. The car is built in America, but on the model of separate two and four berth compartments. The beds are broad, and if your attendant does not show you all the deference Old World custom has led you to look on as your right, he will yet see that you are comfortable. Farther on you may fare worse.

Railway travelling in Australia is above all things leisurely. Dining-cars were until recently unknown throughout the continent, and the rolling stock soon reveals the glorious confusion of inter-state administrations. To complete this journey, roughly fourteen hundred miles from Adelaide to Brisbane, occupies from the Tuesday afternoon until the Friday night, and the railways are of three different grades—broad through South Australia and Victoria, medium in New South Wales, and narrow in Queensland. Most of the line is only single track; the stations are of the slenderest, occasionally little more than a shed; and but one train a day goes each way. You cannot fail to be struck by the absence of goods traffic. In a twelve hours' journey during some

parts of the year scarcely a single goods train may be seen. Local residents explain the fact by declaring that the high rates throttle traffic.

To the ordinary traveller the problem of food becomes a serious one before he has gone far. Up to Melbourne, the refreshments obtained at the halting-places are passable. One soon becomes used to rushing out as soon as the train stops, eating a meal at express speed, and flying back to the train again. Provided the food is decent not much harm is done. But in some of the places between Melbourne and Sydney it is safer to confine one's self to bread and cheese. When steak is served that has plainly been warmed over several times, with onions half-cooked in rancid fat, with abundant grease still floating around them, and with a lump of pastry that would serve as ammunition when lead ran short, the traveller's patience is apt to be tried and his tongue to be set free.

Australians boast of their Government railways as a supreme example of State efficiency. When one compares them with the lines running through western Canada or the newly opened west of America the contrast is amazing. On the Chicago to St Paul express, for instance, one has dainty silver and spotless napery, smart white-coated black waiters, and a meal of many courses served at leisure in the most enjoyable fashion. But then the railway managers there know that if they do not provide for the comfort of their travellers other rivals will. In Australia, with State railways, there is no fear of competition. You must travel by the State line or take a long journey by sea. The State has you at its mercy, and takes full advantage of it.

It is warm when we start from Adelaide, for summer is now on us, but as the train mounts the heights beyond the city the cool of evening comes. Before darkness falls we can catch glimpses of forest land stretching right down to the distant sea, of hills to one side and valleys below, of suburban townships which might be bits of Surrey, and then, farther on, of poorer settlements, small wooden frame-houses, and half-cleared bush.

It is hard to realise the nature of the land as next day we cut through Victoria. There is bush in parts, and there are great bare plains, and here and there collections of houses. A few hours of rest in Melbourne, and then on again.

Many of the places, small as they are, have a history. If you have a friendly Australian by your side—and it is your own fault if you have not, for every Australian is willing to befriend a stranger from the Old Land—the names of the different places will recall to him tales of the old days. Now we pass through the scene of a famous convict-hunt; now we come to the field of the Kelly gang raids which so roused Australia but a generation ago. You stare incredulously at the sleepy village when you are shown the house where Ned Kelly made his last great stand, the mail-clad bushranger and his fellow-scoundrels, surrounded, desperate, and wounded, falling into the hands of the police.

At Albury we change on the frontier into a narrower-gauge railway. The Custom House stands here, a relic of the barbarism of yesterday. In Australia to-day, so far as internal trade is concerned, the tariff barrier has been broken, never to be replaced.

New South Wales is democratic; therefore expect but little of your car-conductor. Your boots will probably remain uncleaned, although he will not be too mighty to accept a tip when you quit him. If you wish to find that official, he will probably be resting comfortably in the smoking-car of the sleeper. Speak to him slowly and pleasantly, and do not be in a hurry for your reply. He will finish whatever he is reading, and take a few meditative puffs at his pipe before answering. The New South Wales sleeping-cars are more distinctively American than those of Victoria; they have all the lack of privacy of the old type of American cars in an accentuated form.

What a land New South Wales is! We pass through hundreds of miles of beautiful territory only wanting clearing to make it the support of nations. The ride over the Hawkesbury mountains must linger in the mind even of an old traveller for its amazing picturesqueness. Mile after mile we travel on the hillside near the river-banks. Here are great bays of placid loveliness; here high hills of astounding majesty. Here and there man has scratched beginnings in these woods; here and there he has settled himself on an odd location; but the whole land speaks of nature rather than man.

It is near midday on the Friday before we reach Queensland, and now at once the most unpleasant and most glorious part of the trip begins. The most unpleasant, for the vibration of the train on the narrow track is very great. It is impossible even to use a typewriter here, for the train oscillates so that the right keys are missed twice out of five times. But the country around repays for all.

The scenery from the window affords one excuse for ceasing work. First comes the long stretch of the Darling Downs, the most fertile tract in southern Queensland. The towns here, not long since almost burned out with the protracted drought, are now revealing renewed prosperity. The fields are blossoming for a heavy harvest. In one part the wheat stands high enough to bury you. The farmers who assemble at every station to see the train pass have a happy air, for good times have come.

Evening approaches, and the scene changes. We are on the towering mountains now, and the vastness of the continent is opened to our view. The train shrieks and groans, but its puffing and its panting are forgotten. We take apparently impossible curves on the mountain-sides, and each curve

opens up fresh scenes. The giant hills, along which we are creeping like a fly on a huge oak, are terrible in their virgin beauty. The distant mountains take a deep-blue hue. Now clouds come between us and the valleys below. Now they open. We gaze amazed, awed, till even over the spirit of the train-weary travellers comes the sense of reverence and of nothingness. 'What is man, that Thou art mindful of him? and the son of man'—— Then the merciful darkness comes, and shuts the vision from our sight.

Three hours later the train runs into Brisbane station, and we are near the edge of the tropics.

DICK HELLIFIELD'S DOUBLE.

CHAPTER IV.

DICK was back again a few days before Christmas. He had not set eyes upon Hasan since his departure from Cairo. Ahmed and I had seen him in and about the city; but beyond a passing scowl he had not betrayed the least interest in us. Our movements were apparently nothing to him. Dick was the man he wanted.

I carefully examined the curios, all of which Dick brought with him from his diggings at the barrage. The scarabees did not interest me very much. I was not an adept, like Dick, in the decipherment of the hieroglyphs which, enclosed in the engraven ovals, formed the cartouches of the defunct priests and kings. Nor did the scraps of knowledge, historical and religious, which Dick had gleaned concerning them appeal to me. I was much more interested in the life of to-day. The combination in Dick of a love for the antiquarian with a faculty for the practical impressed me as unusual. He was disappointed, I believe, when his enthusiasm over the scarabees left me unmoved.

It was different, however, when he showed me the libation-bowl and the Hathor statuette. These touched my sense of the artistic, and I found in them something to admire. Still more freely did the clasp call forth my admiration; it was a delicate piece of workmanship, very small, but perfect in its details. The figures of the god and goddess were conventional and archaic, but exquisitely engraven; and the appearance of Horus (the child of the two) when the parts were brought together was a triumph of ingenuity. The fastening formed itself into the shape of the child, and completed the triad; and I quite agreed with Dick in his surmise that it must have been filched from the mummy-case of an old priest who had once been devoted to the cult whose centre was at Philæ.

'Now that you have seen it, Jim, do you still think that it might be used as an amulet?'

'Why shouldn't it? You see, it could still be worn on a robe or girdle, and some magical virtue might be supposed to dwell in it, and to be imparted with the fastening of the clasp to the person of the wearer.'

'Um! there are stranger things than that in this land of the Pharaohs. But, Jim, it means that the clasp is known; that there are others; that this clasp of mine is not unique, and I was flattering myself that it was. You are taking away from the value of it. I have never seen one before, and never heard of one.'

'That may be, and I don't pretend to understand these things, while you have made a study of them. But there may be others, one or two perhaps, for there cannot be many; and the fewness of them, with the peculiarity of the workmanship, may have caused a people to whom magic is real to regard them as the repository of occult powers. I may be talking tomfoolery, of course; but I am trying to find a sufficient reason for Hasan's vindictiveness and his determination to kill you.

'And you seem to me to be going very far afield to find it. Is there not a sufficient reason in his desire to avenge the blow I gave him? He may think, too, that I was the main cause of his dismissal; for the two came very close together. They were only casually connected, however, and with his dismissal I had very little to do. But he may not be aware of it. These Eastern mixtures, Jim, are fiery, and his own temperament may account for his attempts on my life.'

'Not altogether;' and I shook my head. 'There is something else in it, and it is only natural to look for the something else in what you have deprived him of, and what, by killing you, he still hopes to gain.'

'Well, we may find out,' said Dick; and we dismissed the matter from our minds.

We moved quite freely about the city during the next few days, but Hasan did not appear. We began to hope that he might not be aware of Dick's return. A new and unexpected development, however, took place on Christmas Eve. Directly dinner was over, Ahmed presented himself and said that a messenger from a villa beyond the Nile desired to see Dick.

'Who is he, Ahmed?'

'I not know, Mis'r 'El'field; not seen him before, sir.'

'Tell him to send in his message by you.'

'I tell him, Mis'r 'El'field, but he not do it.'

'Is he one of Hasan's men?'

'I think not, sir. I be with you when he speak, and Mis'r Jim too. Then he not touch you. Shall I say you see him?'

'Yes. Show him in, Ahmed.'

The messenger was evidently a confidential servant of some kind. His attire was more Greek than Egyptian: baggy blue trousers, a short sleeveless jacket of the same hue ornamented with a profusion of silver braid, an embroidered shirt of fine white linen, a red fez, and a red girdle, forming together a neat and distinctive livery. He was taken aback when he found that Dick was not alone, and that Ahmed did not retire after he had ushered him in. He included both of us in his profound salutation; but, not having seen Dick before, he was at a loss which of the two he should address. Ahmed informed him that the one to the right was 'Mis'r 'El'field,' but he hesitated still, and explained somewhat confusedly that the message was for the ear of 'Mis'r 'El'field' alone. Dick told him to speak out. He said he could not; the message was personal and private. To which Dick replied that the man could return to those who sent him with his message undelivered. He declined to hear it if it could not be spoken in the presence of his friends. Ahmed was his friend—yes, Ahmed, for the messenger had involuntarily turned towards him at these words—as well as myself; and he would hear nothing unless we were there, and do nothing without our consent. Dismayed at this attitude, and fearing to return with his task unfulfilled, the messenger told him that his attendance was desired, without delay, at the residence of Murad Bey. The business was important, but he was unable to reveal it for the simple reason that he did not know what it was. Would Mis'r 'El'field accompany him? He was charged with his safe conduct out and back again.

So far as I was concerned, if the messenger had only known, he might have spoken quite freely and without scruple, as I could not understand him. Nor did I know what his message was until Dick explained it to me. His face had impressed me favourably; but I had been quick to notice his surprise and hesitancy, and also the earnestness of his tones when the message was given at last.

'What do you say, Jim?'

'That it may be a ruse, and you will do well to stay where you are.'

'Nay, Jim, a ruse would not be so simple as that. It is too easily seen through, too commonplace, for a ruse. Look at the fellow's face! Is it likely, think you, that he has been sent to entrap me? Hasan's tool would have worn a sharper edge and cut deeper. His message is genuine, I believe, and I feel inclined to accept it.—What do you say, Ahmed?'

'That Mis'r Jim and I go with you.'

'Good! Now, Jim, are you ready for the adventure?'

'What if I am not?'

'I shall stay here, of course. I am not foolhardy enough to go alone. Hasan is not far away, I am sure of that; and if he knew of the journey I should receive unpleasant attention. Still, I am convinced that he hasn't put this thing up—it doesn't smell of Hasan; and if you and Ahmed will go with me I will go.'

'All right,' said I, after a moment's consideration, for I had the impression that if I did not consent Dick would be disappointed.

The messenger listened without comprehending, and yet with evident concern, and when Dick gave him his decision he was certainly relieved. His countenance fell, however, as Dick went on to say that the three must go. He would not budge an inch without us.

'But,' said the messenger, 'it was you, Mis'r 'El'field, only you, that I was sent for.'

'And I tell you plainly,' answered Dick, 'that it will have to be the three or none.'

He shrugged his shoulders in reply, and assumed an expression which meant that the responsibility would be Dick's, and not his. If the three were inevitable—well, he would submit. 'When can you be ready?' he asked.

'At once,' said Dick.

'Then I will call the carriage;' and with another bow he backed out of the room.

'A carriage! I hadn't thought of that,' said I when he was gone.

'We couldn't go to Murad Bey's without one,' returned Dick, 'and the kind of carriage he will call will prove almost conclusively whether his message is genuine. We can still refuse if it should turn out to be a second-rate hired affair picked up at one of the stands.'

There was no need to refuse on this ground. As we came to the entrance there was the carriage—a private one, well appointed, with a liveried coachman on the box holding in a spirited pair of splendid bays. After seeing us in and closing the door, the messenger, instead of following us as we half expected, took the vacant seat beside the coachman—another little proof that he was not deceiving us—and we rolled rapidly away. We were soon across the river and in the darkness of the country beyond. The wheels spun silently over the dusty road, and the quick pad of the horses' feet stepping well together was the only sound we could hear. In a couple of miles or less we were whirled through the open gates of an extensive garden, and drew up by the lighted porch of a large, low villa. It was too dark to discern its features, even if we had had time, for as soon as we alighted we were shown into a small anteroom adjoining a spacious hall.

The furniture was meagre but good, and, to my surprise, European—such an anteroom as might be found in a score of residences in London or Paris. We had barely time to notice it before a second door opened and a lady glided in—by no means European, indeed dressed in distinctive Turkish costume, with a snow-white diaphanous *yashmak* folded about the lower part of her face. She was very beautiful; it was a type of beauty

seldom met with in the East. Her face was a charming oval, lily-like in its complexion, with small and delicate features and expressive light-brown eyes. She was startled to find herself confronted by three men instead of one. We were startled also, for we were expecting Murad Bey. The appearance of a lady, and alone, was a serious breach of custom which only some great need could justify.

'I sent for Monsieur Hellifield,' said she in French. The tones were remonstrant, indignant, spoken with an angry flush upon the face, and on tiptoe to retire.

'I am he, madame'——

'——moiselle,' she corrected instantly, and facing him as Dick took a step forward and bowed. Her tones were still vibrant, and the flush had not died away. 'I am *gouvernante* to the children of Murad Bey, and I sent for you only, and not these. It is an intrusion.'

'Then we will go, mademoiselle,' answered Dick. 'There is nothing more to say except to beg a double pardon;' and we turned to the door.

'Stay!' she commanded. Then, as we turned again, and perhaps to gain time, 'Why a double pardon?'

'For wrongly addressing you,' said Dick, 'and bringing with me these two friends as a safe-guard.'

'The first was a natural mistake'—and she smiled graciously—'but the second was surely unnecessary. There is nothing to fear.'

'Not here, with you, mademoiselle; but coming and going—yes! Then you must remember that it was not you I was expecting to see, but Murad Bey.'

'Ah! it is I who should ask for pardon. You had something to fear coming and going. Hasan is in the city.'

'And Hasan is my enemy.'

'And mine.'

'Then we have something in common. Is that the reason why you have sent for me?'

'Partly, yes. You can help me, I believe, to escape out of his toils. He is my half-brother, much older than I am, and in a sense my guardian. Against my will, and for his own ends, he is trying to force me into a marriage with a man I detest; and I want your assistance, monsieur, that I may defeat him.'

'How?'

'You are a collector of antiques, monsieur.'

'In a small way, mademoiselle, as an amateur.'

'And there came into your possession a little while ago an ingenious clasp, the clasp of the triad of Philæ. Will you sell it to me?'

'But how can that help you, mademoiselle?'

'As a protective amulet. You may not know the virtues which are hidden in it. My purpose, and not Hasan's, will prevail if I can induce you to part with it. My purpose,' she repeated, 'for the amulet is not only protective; it will secure for me my own wish, and Hasan's defeat will be irreparable. Will you sell it to me, monsieur?' she asked again with a pleading earnestness.

'No,' said Dick after a momentary pause. The light in her eyes was quenched by Dick's refusal, and a sudden tremor shook her slender frame; but the tremor ceased as suddenly and the light leapt back again as Dick proceeded: 'I will give it to you. It is a time for presents and the best of good wishes among my people; and although I am no believer in amulets, I am in good wishes, especially when accompanied by a welcome gift. The clasp is yours, mademoiselle. I will send it in the morning by my servant Ahmed. May both your desires be speedily fulfilled!'

'I cannot express my thanks,' said she, with beaming eyes and a flushed and happy face. 'You have done me a great service, monsieur, generously, graciously, far better than I deserved, considering the manner in which I received you; but that you will pardon I know, for indeed I have run a serious risk in receiving you at all. And, believe me, I shall always be grateful to you—always;' and in a moment she was gone.

The carriage was waiting for us, and we reached the hotel without mishap.

'Did you recognise her, Dick?' I asked when we were alone.

'Yes. Did you?'

'Immediately. She was the lady we caught a glimpse of through the carriage window when we were crossing the Nile. Her face is like a flower.'

'And a very sweet flower at that,' answered Dick. 'Some one is in love with her, and the love is reciprocated—a lucky man, surely, whoever he is. She does not intend to let that rascally half-brother of hers sell her to the highest bidder. And she believes in the amulet. Well, she is welcome to it if it will do her any good. I hope it will.'

'So do I.'

In the morning Ahmed was despatched with the clasp, and returned with a profusion of thanks, and also with the information that he had been shadowed there and back by Hasan.

Later in the day we strolled through the garden. It was as unlike a typical English Christmas Day as one could well imagine. The sun, pouring his brilliant rays out of a cloudless sky, had been very hot, but now his rays were tempered by their obliqueness and a soft haze which heralded the approach of the evening. After a couple of turns round the paths Dick and I sat down by a small shelter. There were other chairs about, one of which, some little distance behind us, was appropriated by Ahmed. The gardens were very quiet, but the hum of the adjoining bazaars fell soothingly on our ears. A few loungers drifted by as we talked together in low tones and disconnectedly, with meditative lapses between, of the home-land. We were both thinking of the merry Christmas revels

that we knew were going forward in the houses of our friends; and, having recovered wonderfully during the past two months, I was longing to be among them. My longing was shared by Dick, a longing which he began to express, when, stopping suddenly in the midst of a sentence, he drew himself together, passed his hand across his brow, and gazed intently across the path towards the shelter of the trees.

My eyes followed his. Before me, visualising while I gazed, was his counterpart, the exact image of Dick himself down to the tiniest detail. It was seated, as Dick was, on one of the garden chairs, erect, rigid, a mirror-like reflection even to the answering stare. While I held my breath in amazement, Hasan, brandishing aloft a long keen blade, rushed upon it out of a clump of bushes on the other side of the way. So real was the scene that I started to my feet with an involuntary cry. My cry, however, could not prevent the impending catastrophe. Even as it left my lips the would-be assassin precipitated himself impetuously upon the simulacrum, and with a vehement downward stroke of his weapon endeavoured to despatch it. But the phantom was gone. The desperate stroke met with no resistance. Unable to check himself, Hasan crashed through the flimsy chair and broke it into a dozen fragments. Among the débris he lay doubled up, silent, motionless, his right arm bent under him. Ahmed ran and turned him over. In the violence of his fall Hasan had driven the dagger into his own heart.

When I looked round, wondering at Dick's quietness, I found that he had fainted. He speedily recovered, however, and regarded me with a curious smile.

'You saw the double?'

'Distinctly.'

'Again it has saved my life.'

'It has. The stroke would have killed you. Hasan has overreached himself this time. You are happily rid of him, Dick.'

'So is the *gouvernante* of the children of Murad Bey. May she marry the man of her choice!' a wish which, as we learned from a private note breathing her ardent gratitude, was speedily fulfilled.

Dick returned home with me. From that time he has never seen his double, nor does he desire to see it again.

THE END.

THE MONTH: SCIENCE AND ARTS.

A RIVAL TO CELLULOID.

HOUGH celluloid is a convenient chemical preparation for the manufacture of a wide variety of ephemeral articles, both utilitarian and ornamental, its high inflammability is a constant danger. In view of these circumstances particular interest is being centred in 'galalith,' a remarkable German invention which is now coming extensively into vogue, since it is non-inflammable, of great strength, and of wide value in its possible applications. The material is a perfectly odourless horn-like product, prepared from casein, the cheese constituent of skimmed milk. At first sight it may seem somewhat incredible that such an apparently waste product as this can be turned to valuable commercial advantage; but when it is remembered that vulcanite, which it resembles closely in texture and external appearance, is made from vegetable milk, the probability of it being possible to produce a plastic substance out of animal milk is apparent. Owing to the low price of the raw material and the inexpensive nature of the secret process by which galalith is prepared, it is now becoming a formidable rival to the more generally adopted celluloid. In fact, it is being applied to all those varied purposes to which the last-named compound is generally adapted, such as ladies' combs, brush-backs, cigar and cigarette holders, rings, tobacco-boxes, &c., and, owing to its greater strength, to a large number of additional objects, such as umbrella-handles, piano-keys, chess-figures, and dominoes. It can be produced in any desired colour, marbling, or veining in imitation of some more expensive material, since, owing to its character, it is peculiarly adapted to the artifices of the imitator. This is especially borne out by the fact that galalith tortoise-shell can scarcely be distinguished from the genuine substance even by the most stringent test of chemicals, while similarly amber and coral are being so skilfully reproduced as to defy detection. The material is also being widely used for inlay work, instead of the more expensive naturally coloured woods; for this it is eminently suited, as the colours are beautifully clear and bright, while a polish can be imparted which is more durable than that given to wood.

A SAFETY PETROL STORAGE-TANK.

The volatile and explosive nature of petrol is well known, and severe legislative restrictions as to its storage in even small bulk is a detriment to various industries to which it is applied. With the idea of removing this bar against its wider utilisation, an ingenious safety device by means of which the fluid may be handled with impunity without any danger of explosion has been contrived. The invention comprises a combination of safety-plugs fitted with internal safety-tubes, the latter being on the principle of the wire-gauze cylinders used in the Davy mining-lamp. The fittings can be connected easily to any vessel in which petrol is stored or carried. The gauze tubes are inserted

in the openings in the can or tank, and extend to the bottom of the receptacle, the orifice then being sealed by a plug held in position by fusible solder. In the event of the can coming into contact with fire, the metal plug melts, is blown out, and the petrol within, which has been vaporised by the heat, issues through the gauze tube, and when ignited burns with a small flame outside the can. To demonstrate the efficiency of the invention a series of tests were carried out by a fire prevention committee. Whereas twelve out of seventeen cans of the ordinary types filled with petrol, when brought into contact with fire, exploded with varying force, hurling the burning liquid in all directions, twelve vessels fitted with the safety device failed to explode, the volatilised spirit simply burning harmlessly away at the opening until the contents had been consumed. In view of this complete success it should be possible now to store this spirit in bulk without the slightest risk, since the invention is applicable to any type of reservoir, from the smallest can to the huge tank. It is also applicable to open vessels which may contain quantities of the spirit, the vessel in such instances being simply covered with the gauze. Should, therefore, a light be brought into proximity to the spirit it does not flare up, but merely burns away in a small flame.

A NEW SUBSTITUTE FOR CEDAR-WOOD.

One outcome resulting from the huge output of lead-pencils—which industry is far greater than might be supposed—has been the difficulty in securing the requisite supplies of cedar-wood which is exclusively used for the purpose. The raw material, owing to the heavier demand and the limited supply, has rapidly increased in price. Under these circumstances it became incumbent to discover a substitute for the cedar; and, as no other equally suitable wood was forthcoming, efforts were made to evolve a synthetic product which would suffice equally well. These efforts have been crowned with success. The fundamental constituent of this chemical compound is potato, and the material can be produced so cheaply that pencils made therefrom are now being manufactured in increasingly large quantities. The pencils are of the same familiar shape and size, but owing to the density of the synthetic substance are a trifle heavier. They are, however, more easily sharpened. An extensive factory with a daily capacity of forty-eight thousand pencils is now in course of erection. Owing to the low price at which the potatoes can be procured, an appreciable saving in the cost of manufacture will be effected, and the threatened crisis arising from the dearth of cedar-wood avoided.

AN AUTOMATIC TELEPHONE EXCHANGE.

If there is one great drawback levied against the telephone more than any other, it is the impossibility of securing absolutely private conversation, owing to the communication having to be established between the two desired points by one or more exchange-plugs, which thus offer a ready means of tapping the line. In order to overcome this serious disadvantage an automatic exchange device has been perfected by three ingenious Canadians, the Lorimer Brothers. In this system, which marks the greatest advance in telephony since Bell first perfected the 'talking-wire,' the ordinary exchange switchboard is done away with entirely, as well as the staff of operators. If a subscriber wishes to ring up a number he simply does so from his own instrument, and the exchange automatically brings the desired line into direct communication instantly and with complete certainty. Suppose, for instance, you wish to ring up No. 8295. On your desk at the base of the instrument is a small box in which are four slots, each fitted with a moving lever. These slots represent units, tens, hundreds, and thousands respectively, and each slot is calibrated from one to ten. In the units-slide you move the lever to 5, the tens-lever to 9, the hundreds-lever to 2, and the thousands-lever to 8, give the small crank-handle at the side a few turns, place the receiver to your ear, and your call is answered almost before you have completed the operation. Though the system may seem somewhat involved from the description, it is really very simple. Your conversation completed, you merely hang up your receiver, and the connection is instantly and automatically broken. At the exchange the automatic mechanical apparatus is somewhat intricate in its design but simple in its operation. The exchange is subdivided into a number of units or sections, each of which is complete in itself, and each of which serves one hundred subscribers. By the movement of the levers at your instrument, a revolving indicator is brought into play until the line you desire is secured, when the electrical connection is established in precisely the same manner as the plugs are inserted into their allotted sockets by the girl, and the station you desire is simultaneously rung up. The exchange apparatus, which is almost human in its operation, is of substantial construction, and the possibility of breakdown is quite remote. In fact, it is so certain in its working that at the central station where the system is in operation in Canada it is left during the night without any attendant. The fact that no one can break in upon your conversation is a distinctly valuable feature; and should some one desire to ring you up when thus engaged, the third party will only hear a busy buzz, showing that the line is occupied, but not a syllable of your conversation. Similarly, should your line break down, instantaneous intimation of the fact is given by the exchange apparatus, and the attendant can issue the necessary instructions for the repair of the defect. Moreover, after a conversation, should you inadvertently omit to disconnect your circuit an alarm will ring out in the exchange and continue doing so until the attendant supervenes and restores the lines to their

normal condition, an operation which can be effected instantly. The system has been submitted to a very thorough and prolonged test in Canada, and several new exchanges in course of installation are being fitted up with the Lorimer automatic system in lieu of the conventional switchboard and operator.

HISTORY TAUGHT FROM MAPS.

The 'dryasdust' methods of teaching history and the mere iteration of dates of importance in chronological order have long been deplored by tutors and pupils alike. What is required is to make the subject attractive, with the incidents emphasised in some striking manner. A step in the right direction, and one which will materially contribute to the easy mastering of what is now a somewhat difficult subject in the educational curriculum, has been made by the introduction of the 'history map.' It is designed upon lines analogous to the geographical map on Mercator's projection. Whereas in the latter the vertical and horizontal lines respectively refer to facts in space, as represented by longitude and latitude, in the history map the corresponding lines relate to facts in time. The map covering, say, a particular dynasty is divided into vertical columns, each of which corresponds to a year in the duration of that epoch. The horizontal lines, the spaces between which are differently coloured, indicate the length of the reign of each sovereign and, read downwards, the most eminent men and most important events in political, diplomatic, domestic, literary, and scientific circles, together with the movements of affairs in Scotland, Ireland, the colonies, and abroad. By this simple graphic exposition it is possible to ascertain all the leading features of a certain reign at a glance, obviating that irritating frequency of cross-references common to the ordinary text-book methods. It will be realised that such a system as this has great possibilities. It can either be a mere compact summary or a fully detailed chart of life from year to year. Certainly it constitutes the most impressionistic method of initiating the young scholar into the principal facts in history, and should therefore have a wide vogue among our schools.

THE NEW LODGE MOTOR-CAR IGNITER.

Every motorist is only too painfully cognisant of the troubles often experienced with ignition, especially when the plugs become fouled with soot or drowned in oil, thereby resisting the passage of the current producing the spark between the terminals of the plug. Such troubles, however, can now be completely averted by means of the new igniter which has been evolved from Sir Oliver Lodge's discoveries in high-frequency electric currents. This apparatus is used in precisely the same way as the ordinary high-tension trembler coil, the only and the most vital difference being the production of a white-hot banging spark of such intensity that all resistances to its passage such as soot or oil are completely broken down and the mixture fired. The igniter comprises an application of two special glass condensers which act as Leyden jars in the secondary circuit. When these become fully charged they overflow and give rise to what is described as the high-frequency 'B' spark, which precipitates across the gap represented by the space between the plug terminals an instantaneous surge of current of great potential energy. An idea of the intensity of this current may be gauged from the fact that even when the plug is wholly immersed in water or oil the spark will continue to be produced with equal vigour and potency—which, needless to say, is quite a new development in automobile ignition practice. The system has been in operation for some months past in connection with large gas-engines, but its adaptation to motor requirements is a new application, and one by means of which ignition-troubles are entirely banished from the motorist's worries.

HARNESSING SCOTLAND'S WATER-POWER.

The utilisation of water-power in these islands for the generation of electrical energy has always been severely restricted, mainly on æsthetic grounds. This prejudice is, however, being slowly overcome, since it is realised that even in grim industrial undertakings the engineer can so design his work as to reduce disfigurement of the natural beauties of the surrounding country to the minimum. This is being shown in the construction of the huge thirty-five thousand horse-power installation at the head of Loch Leven in Argyllshire for the supply of energy to the new aluminium-works that are to be established at this point. The undertaking possesses many interesting features. By the erection of the three-quarter-mile long dam an artificial reservoir seven and a half miles in length will be created, which will probably rank as the reservoir having the largest capacity in Europe. Three lochs will be submerged in this scheme. The water from the lake will be drawn off through a conduit eight feet in diameter and four miles in length, with a gradient of one foot in a thousand to the penstocks or collecting basin, from which the water is taken through a number of smaller pipes to the water-turbines a mile and a quarter away and nine hundred and thirty-two feet below, so that an ample fall is secured. The situation is an ideal one for the object in view, since the rainfall averages about one hundred and twenty inches per annum, so that no apprehensions regarding a sufficiency of water for the reservoirs need be entertained. By the completion of this undertaking a flourishing industry will be established in the Highlands, and a couple of large villages will grow up at Kinlochleven of some five or six thousand persons, representing the workmen to be employed in the aluminium-works, with their wives and families. Every care has been exercised to prevent this incursion of commerce into such sylvan country marring the scenic beauties; and although the district is at present considerably

broken up and disfigured by the constructional works and temporary buildings, the completion of the dam will see restoration to its original condition.

THE MOST ECONOMICAL ELECTRIC LAMP.

The struggle between gas and electricity for supremacy as an illuminant continues apace; but with the introduction of the new Osram lamp honours rest for the time being with electricity. The filament of this lamp is made from the rare metal tungsten, the lighting efficiency of which is more than four times as great as that of the carbon filament of the same current consumption. The lamp is made in standards of thirty, fifty, and one hundred candle-power, at voltages from one hundred to one hundred and thirty, so that for ordinary purposes they have to be arranged in series of two in the same manner as the tantalum lamp. It, however, marks as great advance upon the latter as does the incandescent gas-burner upon the half-penny dip, for it is more economical in current-consumption, and yields a better light, which in appearance is the nearest artificial illumination to daylight, since delicate colours can be judged as easily and truthfully thereby as by day. Though it is a trifle more expensive in initial outlay than any other type of electric lamp, its current-consumption is much lower, being 1·25 watts as compared with 2·2 for the tantalum, representing an economy in current of nearly 1 watt per candle-power. The average life of the lamp is approximately one thousand hours, with the additional advantage that as its life becomes shorter the bulb does not blacken as is usual with the ordinary carbon filament lamp, but the light remains constant until it fails. One point, however, must be borne in mind with the Osram lamp: it must be burnt vertically downwards, since, owing to its fragile nature and the hair-like thickness of the filament, when incandescent it becomes somewhat softened, and will sag if hung at an angle. A large paper-mill near Glasgow has recently been fitted throughout with this lamp, and the soft daylight brilliance of the illuminant forcibly impresses the visitor, while facilitating the operations of the workmen even when engaged upon the most delicate work.

THE ROSTIN AUTOMATIC GAS-LIGHTER.

A short time ago we referred to the Rostin automatic system of lighting street-lamps, and now the results of the experiments carried out in a London borough therewith afford interesting reading and give a convincing insight into the possibilities of the invention. In the case under notice the saving in the light per lamp during a year is four hundred hours, and this upon eight hundred lamps so fitted represents one hundred and seven pounds seventeen shillings and eightpence; while, as the maintenance charges are reduced by six shillings per lamp as compared with the old system, representing a further economy of two hundred and forty pounds per annum, the total net saving is no less than three hundred and forty-seven pounds seventeen shillings and eightpence. This sum represents upon the initial outlay of two thousand pounds for fitting the lamps with the apparatus a return of 18 per cent.—a highly gratifying result. Under these circumstances it is not surprising that the system is being rapidly extended, one gas company having completed arrangements for the fitting of the device to the whole of the four thousand five hundred public lamps under its control. With this apparatus all the advantages of electric lighting are secured in respect to the lighting or extinguishing of the whole of the lamps within a certain area from one central point when required. The value of such a boon can be widely appreciated in our busy industrial centres when the settlement of a fog during the day threatens to disorganise street traffic. By means of the Rostin apparatus the whole of the public lamps can be lighted simultaneously upon the arrival of the fog, and extinguished again directly it lifts.

A NOVEL WATERPROOF COVER.

A natty little device which will be appreciated by book-lovers who desire to keep the boards of their books clean when travelling has been invented by an Edinburgh bookseller. It is waterproof, and by means of inner pockets it slides firmly over the edges of the boards, while at the same time it can be adapted to books of varying thicknesses. Once attached—a matter of two or three seconds—it remains in a tight position until released, and it is impossible for the book-cover to become soiled through handling or wet.

FUEL FROM HOUSE REFUSE.

To the more economical and useful utilisation of the contents of the humble dust-bin there appears to be no end. The latest development is the production of a fuel known as 'coalescine,' primarily intended for industrial use, as distinct from the open grate. The process of preparation, which is the invention of an English borough surveyor, comprises the pulverisation of the organic and inorganic matter contained in the dust-bin, and its subsequent admixture with tar or tar-and-pitch, after which it is pressed into briquettes. The fuel is stated to burn with a high efficiency in ordinary boilers, is perfectly hygienic, and can be manufactured very cheaply. The calorific qualities of such refuse is well known to be very high, as is evidenced by its wide utilisation in municipal dust-destructors for the generation of steam for driving electric machinery. The new system should directly appeal to those smaller towns where the exigencies do not warrant the heavy expenditure incidental to the installation of a dust-destructor, since the apparatus for preparing the fuel is of simple design and inexpensive to lay down, while the revenue reaped from the sale of the article should render it at least practically self-supporting.

A LONG DUEL.

By Frederick H. Heryet.

THE medieval custom of settling quarrels by personal combat dies hard on the Continent, and few things contribute more to the mirth of nations than the jests and caricatures inspired by the duelling exploits of our Gallic neighbours. The development among the French of that sense of humour which is our particular pride, and consequently the fuller recognition of the farcical nature of such a settlement, possibly account for the disappearance of that 'thirst for gore,' of that determination to fight to a finish, which formerly characterised the French duel.

The following story presents a striking contrast to those we are now accustomed to hear, and gives us some idea of the character of those dashing *beaux sabreurs* by whose aid Napoleon became the scourge of Europe.

In the city of Strasbourg at the close of the eighteenth century soldiers of all ranks had ample opportunities of picking quarrels whenever they wished. A captain of hussars named Fournier indulged in this amusement to his heart's content, and became celebrated for his aggressive temper and his address with arms. Strasbourg had to reproach him for the loss of several of her sons, and especially for having challenged without any plausible reason a young man named Blume, whom he killed without the slightest pity.

On the very day of Blume's funeral General Moreau gave a ball, to which were invited all the members of the high *bourgeoisie*. It was desirable to avoid the scandalous scenes which could not fail to take place between the fellow-townsmen, perhaps the relations, of the unfortunate deceased and the aggressor, who was styled his murderer. General Moreau therefore desired his aide-de-camp, Captain Dupont, to prevent Captain Fournier from entering the ballroom. Dupont stationed himself in a corner of one of the antechambers, and immediately he caught sight of him accosted him abruptly.

'What are you going to do here?'

'Ah! is that you, Dupont? Good-evening. *Parbleu!* you see what I am doing. I am come to the ball.'

'Are you not ashamed to come to a ball the very day of the funeral of that poor fellow Blume? What will his friends and relations say?'

'They may say what they please; it is all one to me. But I should like to ask what business that is of yours.'

'It is everybody's business. Everybody is thinking and talking about it.'

'Everybody is wrong, then. I don't like people to poke their noses into my affairs. And now, if you please, let me pass.'

'You shall not go into the ballroom.'

'Indeed! Why not?'

'You must take yourself off. The General orders you to return to your own apartments.'

'Am I turned out of the house?'

Dupont shrugged his shoulders.

'Are you aware of the consequences of turning Fournier out of doors?'

'I don't want to hear any of your rodomontades. Just have the goodness to take yourself off.'

'Listen!' said Fournier in a fury. 'I cannot have my revenge of the General, because he is my superior officer; but you are my equal; you have presumed to take your share in the insult, and you shall pay for the whole of it. We will fight!'

'Listen, in turn,' said Dupont. 'I have long been out of patience with you. I am disgusted with your bullying ways, and I hope to give you a lesson you will long remember.'

Fournier would have gone mad with vexation had he not been consoled by the hope of killing Dupont. But the result of the combat was not what he expected, for Dupont gave him a frightful wound.

'You fence well,' said Fournier as he fell.

'Not badly, as you see.'

'Yes; but now I know your play. You won't catch me another time, as I will soon show you.'

'You wish for another encounter?'

'*Parbleu!* that's a matter of course.'

In fact, after a few weeks' nursing, Fournier, for the second time, was face to face with his adversary. It was now his turn. He gave Dupont a home-thrust with the comment, 'You see you hold your hand too low to parry properly. After your lunge you gave me time to stick three inches of cold iron between your ribs.'

'This is only the second act,' cried Dupont. 'We'll come to the catastrophe as soon as possible.'

At the third meeting they each received a trifling scratch. So these two fire-eaters, annoyed at such a negative result, agreed to recommence the struggle until one of the two confessed himself beaten. They therefore drew up a treaty to this effect, and whenever the madmen were able to meet they fought. Their persons were marked with numerous scars, yet they continued to cut and slash at each other in most enthusiastic style. Fournier used to observe now and then, 'It is really astonishing that I, who always kill my man, cannot contrive to kill that devil Dupont.'

After these encounters had continued some years, Dupont, now promoted to the rank of General, received orders to join the army of the Grisons. He was not expected, and was trying in vain to find a lodging, when he perceived a châlet, through whose

windows a light was gleaming. He knocked at the door and entered. A man was writing at a bureau; he turned his head, and, recognising his visitor, said before the other could cross the threshold, 'Ah! is that you, Dupont? We will have a little sword-play.'

'With all my heart,' said Dupont to Fournier, who chanced to be the occupant of the châlet; and they set to work, chatting between the passes.

'I thought you were employed in the interior,' said Fournier.

'The Minister has promoted me to the fourth corps.'

'*Vraiment!* What a curious coincidence! I command the cavalry there. And so you have only just arrived? I am delighted.'

At last General Dupont's sword, after piercing General Fournier's shoulder, struck the wall.

'*Sapristi!*' shouted Fournier.

'You didn't expect that.'

'On the contrary, directly I left my guard I knew I was caught. But 'tis you who don't expect what is going to happen.'

During this little dialogue Dupont kept Fournier pinned to the wall, as a naturalist would a butterfly.

'Well, what will happen?'

'The moment you stir I shall give you a thrust in the belly. You are a dead man,' said Fournier.

'I shall parry your thrust.'

'Impossible.'

'I shall keep you pinned till you throw down your sword.'

'I shall not do that. I intend to kill you.'

Fortunately the noise made by the two Generals was heard by some officers, who separated the combatants.

Dupont, the more reasonable of the two, sometimes thought of the absurdity of a quarrel which still went on after so many conflicts, and at last decided to make an end of the matter.

One morning he called on Fournier.

'Are you come to fix a day for a match?' inquired the latter.

'Yes; but first of all let us talk a little. Listen. I intend to get married, and before doing so I should like to be done with you.'

'Oh! oh!'

'Our quarrel has now lasted for nineteen years. I do not wish to continue a style of life which my wife might consider not exactly comfortable, and therefore I am come to propose a change in the mode of the combat. One of my friends has, at Neuilly, an enclosure planted with trees, surrounded by walls with two doors, one at each end. At the hour agreed we will go to the enclosure separately, armed with our two holster-pistols, to take a single shot with each. We will try which can find the other, and whoever catches sight of the other shall fire.'

'That's a droll idea.'

'Does it suit you?'

'Ten o'clock on Thursday morning—will that do?'

'Agreed. Adieu till Thursday.'

They were punctual at their rendezvous, and as soon as they were inside the enclosure they sought each other cautiously. They advanced slowly, cocked pistols in their hands, eye on the watch, and ear all attention. At the turn of an alley they perceived each other. They threw themselves behind a couple of trees and waited. At last Dupont resolved to act. He waved the tail of his coat just outside the tree which protected him; then he protruded his arm, drawing it back instantly. Immediately a bullet sent a large piece of the bark flying. Fournier had lost a shot.

After a time Dupont recommenced the same manœuvre on the opposite side of the tree-trunk, without, however, drawing his adversary's fire. Then holding his hat in his hand, he displayed it as far as the brim. In a twinkling the hat was blown away; fortunately there was no head inside it. Fournier, therefore, had wasted his second bullet.

Dupont then sallied from his fortress and marched up to his opponent, who awaited him in the attitude of a brave man for whom there is no further hope. When Dupont was close to him he said, 'I can kill you if I like—it is my right and my privilege; but I cannot fire at a human creature in cold blood. I spare your life.'

'As you please.'

'I spare you to-day; but you clearly understand that I remain the master of my own property, of which I allow you the provisional enjoyment. If ever you give me any trouble, if ever you try to pick a quarrel with me, I shall take the liberty of reminding you that I am the lawful owner of a couple of bullets specially designed to be lodged in your skull; and we will resume the affair exactly at the point where I think proper to leave it to-day.'

So ended a duel begun in 1794 and finished in 1813.

ON THE THIRTY-FIRST OF DECEMBER.

The slant-faced hills, the lowly vales, all eye
Their crystal robes of softly clinging snow;
The frost-bound streams no longer seawards flow,
Though 'neath their icy coverlets they try;
The woods are silent save for Winter's sigh,
Their withered leaves the winds long since laid low.
And now, good friends, with pulsings calm and slow,
The parting year will bid us all Good-bye.
But Father Time—whose step we know draws nigh
With even pace, unmoved by weal or woe,
Or life or death of either friend or foe—
I pray will bring us, as he passes by,
When midnight fades and smiling morn is here,
A Happy, Peaceful, Plentiful New Year.

SIXTH SERIES.

A ROMANCE OF ORD.

By H. HALYBURTON ROSS, Author of *Margaret and the School-Board*, &c.

CHAPTER I.

HOW many a romance has begun in church!—though whether it is the religious atmosphere of the place or the long period of enforced inaction that is most responsible would be hard to determine. Certainly, in the case of Katie Bethune, the minister's daughter, and Martin Ellis, the new Laird of Ord, their acquaintance may more truly be said to have commenced on the Sunday morning—when, during the early part of the service, she raised her head and met his eyes for the first time in full glance—than at their later introduction. Both felt it to be so, and acknowledged it to each other when the acquaintance had ripened into something more intimate. But this is anticipating, and for the sake of historical sequence I must go back to that original June Sunday which was to prove so fateful for them both. To her credit be it said that after the first glance Katie did her best to keep her eyes averted. But as there was no such conscientious endeavour on the Laird's part, it was well-nigh impossible for her to resist the magnetic attraction that seemed to draw her gaze again and again in the direction of the Ord pew.

Nor was she singular in her interest. The eyes of the whole congregation converged by mutual consent upon the tall figure of its solitary occupant, as if in the hope of wresting from his calm, impervious personality the life-story which was for them as yet veiled in mystery.

Six months ago they had not even known of his existence, and all the information they could yet boast in connection with his past was that it had been spent chiefly in savage lands; a strange contrast to his kinsman, the old hermit of Ord, who had just passed away from their midst, and whom some of the more juvenile of them had never even seen.

But, conscious as he was of their scrutiny, the Laird showed no signs of embarrassment. He had come prepared to be stared at, though he had not expected to find anything so worth contemplating in his turn as the slender girlish figure and wholesome beauty of the minister's daughter. He assigned her position at once with the ease which his years of absolute dependence on his own faculties of observation had induced in him. But in any case the likeness between Katie and her father was remarkable. There were the same straight-cut features, the clear, healthy skin, the raven hair—white in the minister's case—and the almost startling contrast of the blue eyes, with their frank, fearless glance. Ellis had met a woman of the prairies once, a backwoodsman's wife, of whom she reminded him; and he recalled now with pleasure many instances of courage and endurance on the part of the little frontierswoman that seemed somehow to shed a reflected lustre on the girl before him.

Then, with an impatient sigh, he checked himself. As far as he was concerned, those days of freedom and irresponsibility were at an end. The old roving life, with its mysterious fascinations and uncertainties, its hazards and dangers, the elementary simplicity of its aims, and the rude justice that was the sole governing rule of its conduct, would in all probability never again be his to enjoy. Henceforward he must conform to the requirements of a narrower though more complex civilisation.

The burden of responsibility which attaches itself to the possession of great lands and wealth already weighed heavily upon him. But for the first time this morning a desire to acquit himself worthily of his obligations outrivalled the conviction of hardship he had previously experienced. Perhaps the frank challenging glance of the blue eyes in the manse-pew had something to say to the sudden growth of the resolution within him; or perhaps the contiguity of those who now owed

[*All Rights Reserved.*]

him their allegiance, and for whose well-being he was to be answerable in the future, appealed to a latent conviction of hereditary power in his nature.

Be that as it may, the first bond between him and his new life had been established; and as he leant back in his pew at the conclusion of the service, and watched the worshippers filing out into the June sunshine that flooded the little kirkyard, a sense of contentment and satisfaction possessed him.

Katie Bethune, too, lingered, as was her custom, till the church had scaled. But once outside, instead of pausing to exchange greetings with the lingering groups among the gravestones, she made her way hurriedly through their midst, and, choosing a short-cut over the fields, let herself in by a private gate to the manse-garden.

She could not have explained the motive of her unusual haste unless it was a desire to escape from the possibility of any chance-meeting with the stranger who had filled all her thoughts that morning. He was certainly very different from what she had expected. The wild and bearded barbarian of her fancy's conception could have nothing to say to this calm, self-possessed man of the world, with his smooth bronzed face and quizzical gray eyes.

Like the majority of the worshippers, she was acquainted with every detail of information that was yet to hand concerning him. Now for the first time a sense of dissatisfaction with the scantiness of her knowledge assailed her. She would fain have known more of his history—penetrated the secret of the personality that lay behind those cool, frank eyes whose half-admiring, half-inquisitive gaze had played such havoc with her devotions that morning. Almost unconsciously she set to work to review the meagre store of facts at her disposal. No detail was too trifling or unimportant for her newly awakened interest.

Even the slight limp that marred the otherwise athletic freedom of his movements had its place in her consideration. She knew it to be the result of a shooting affray out West. But which of the many solutions she had heard offered in explanation of it was the true one she was at a loss to conjecture. Any of them, however, was thrilling enough to appeal to her in her present frame of mind; and, taken in conjunction with the first vivid impression of his personality she had received that morning, helped to intensify the glamour of romantic interest with which her girlish fancy had already encompassed him.

Slowly she wandered on between the tall borders of hollyhocks that fringed the gravel walks in the prim, old-fashioned garden. Something that she had never felt before seemed to have transformed the whole aspect of the place. For her it was no longer just the familiar and somewhat prosaic manse-garden, beloved of her childhood's days, but a new and beautiful Eden, every flower and shrub in which bloomed afresh for her that morning. The Prince had come at last, and Katie's days of dreaming were done.

Their actual introduction took place a few days later. The minister had called, as in duty bound, upon his new parishioner, and it was in response to this visit that Ellis arrived at the manse one afternoon, to find its young mistress installed in her favourite nook under the cedar-tree on the lawn.

She had been reading, but put the book aside at once at sight of him and rose to her feet, a swift colour coming and going in her cheeks, her eyes seeming to take in every detail of his tall figure as he limped across the sunlit grass towards her. Even in the distance the little rebellious jerk of the shoulder with which he sought to equalise the effect of his lameness was painfully apparent to her. But by the time he had come near enough for her to read the expression of his face she had forgotten all about the disfigurement or her instinctive sympathy. Seen closely, the blunt features and quizzical gray eyes were even more attractive than she had supposed them in church. She liked his voice, too, with its lazy inflections, and the unconventional manner in which he took possession of a chair, and, stretching out his long limbs, set to work to make her acquaintance.

To an outsider their conversation would doubtless have appeared commonplace enough; but there was a suggestion of future intimacy underlying it that Katie only realised after her visitor had departed. Almost his first words had been to tell her of the likeness he had remarked in church between her and the little frontierswoman he had known out West, and that had led by natural sequence to further revelations concerning the roving existence that lay behind him. Katie listened, absorbed, to the tale of his adventures; and as he talked he himself was unconsciously entertained by watching the ever-changing play of expression on the face of his audience.

'My brother used to think and talk of nothing else,' she exclaimed at last with a deep-drawn sigh when he had brought his recital to an end; 'he said he felt the West calling him,' a sudden shadow obscuring the brightness of her eyes as she spoke.

'Well?' interpolated Ellis lazily. He was mystified by the change that had come over her face, and more curious to discover the cause than interested in the fate of the brother's aspirations. 'Well?' he repeated as she still remained silent.

Katie turned slowly towards him. 'He ran away from home,' she announced in a would-be matter-of-fact tone. 'My father wanted him to go into the Church, and—well, he wouldn't; so he left us. We have never heard of him since.'

It was Ellis's turn to be silent. Almost unconsciously the memory of all the derelict lives he had known drift into the silence of forest or prairie,

never to return, had assailed him, and with a pessimism born of experience he numbered this one among them.

But before he could collect his thoughts to reply Katie had brought the conversation back to Ord and its surroundings, and they were soon engrossed in a discussion of local topics. She was able to tell him much that he had never known before about the place and the people; and as he listened to her judicious comments, and realised the underlying affection and enthusiasm that prompted all she said and thought, the ambition that had taken shape in his heart the previous Sunday became stronger and more definite.

'You make me ashamed,' he said at last—'I who belong to Ord and am ignorant of either its past history or its present needs; whilst you—a stranger'——

But Katie interrupted him hastily. 'It is nothing to what my father could tell you,' she said, colouring a little. 'I have learned all I know from him.'

'Then it behoves me to improve my acquaintance with him,' said Ellis, rising as he spoke. 'You don't know how ambitious I am to be a good landlord, Miss Bethune,' he added somewhat tentatively the next moment, glancing down at her with a little, embarrassed laugh.

Katie looked straight up into his gray eyes and smiled encouragingly. But before she could utter a word the sound of her father's voice calling her name made them both turn in the direction of the house.

The minister was coming across the lawn towards them, a tall, martial figure in his long driving-cloak, with his white head held high, and the stern, almost classic, severity of his features sharply defined beneath the low brim of his wide-awake.

'Well, has Katie been doing the honours of the manse?' were his first words after greeting his guest, his eyes turning with artless appreciation to his daughter's face.

'So well that I have forgotten the passage of time,' laughed Ellis. 'And, judging by the sunset, I shall have to run all the way home,' he added, indicating the red glow that shone through the fringe of tall fir-trees to the west of the glebe-lands. 'My housekeeper is a martinet for punctuality.'

'But you are not walking, surely!' exclaimed the minister, astonished.

'Of course I am,' retorted Ellis. 'I must have some exercise. Think of the distances to which I have been accustomed!'

'Well, I should have thought, with that leg of yours, you would rather drive when you could,' said the minister bluntly.

Katie felt the hot colour surge into her cheeks as she glanced anxiously at her guest.

But beyond a momentary spasm of bitterness his expression remained unchanged. 'I don't find it troubles me much,' he said, glancing downwards as he spoke. Then, with an abrupt movement, he turned to Katie. 'I want you to come to Ord some day, when I have all my treasures unpacked,' he said in his most matter-of-fact tones. 'I have cases full of trophies—reminiscences of my roving days.'

'Well over now,' supplemented the minister's voice by his side. 'You will find it hard work at first to settle down, my boy,' he went on in an admonitory tone; 'but you must think of your responsibilities. And you have wasted years enough already on your own pursuits.'

Again Katie's anxious glance travelled to her visitor's face. Dearly as she loved her father, his frequent want of tact cost her many a pang.

But to judge by the amused smile that flickered about his lips, Ellis evidently bore no malice for the reproof. 'When I feel a roving fit approaching I shall come to you to steady me, sir,' he said, holding out his hand.

The minister shook it heartily, though his expression had saddened. 'I couldn't keep my own son at home,' he said in a low voice. 'It's not likely I should be able to influence a stranger.'

CHAPTER II.

A FORTNIGHT went by. It is wonderful how long a fortnight can be when you are waiting for something which any day of the fourteen may bring.

Then, when Katie had almost given up hope, the eagerly-looked-for invitation from Ord arrived, and, with woman-like inconsistency, she shrank from the prospect, and would have done anything to avert the ordeal for a few days at least.

During the interval she had seen nothing of the Laird, though hardly a day passed without some anecdote of his personality reaching the manse. At one time it would be his prowess with gun or rifle, at another some exhibition of authority based on a judgment as sound and mature as middle age, or, again, a reckless schoolboy prank or daring unconventionality.

But they all tended in the same direction, and it was plain already that the new Laird of Ord was to enjoy a popularity unknown to his predecessor. Little wonder was it that, nourished by these insinuations of hero-worship, Katie's interest in the new-comer should have steadily increased. She herself hardly realised how large a portion of her thoughts he had usurped until she was suddenly faced with the prospect of seeing him again. Then came that absurd recoil on her part, and a shyness and shrinking such as she had never before experienced.

It was the reproach of this new self-consciousness that kept her silent and tongue-tied during the first part of the long drive to Ord the

following day. The beauties of the road, the glorious freshness of the mountain air upon her face, alike failed to encourage her, and she was thankful when her father's voice at last broke into the silence and forced her to emerge from her unpleasant meditations.

'What are your thoughts, Kitty?' he inquired, thrusting the whip back into its place and slackening the reins on the mare's neck for the long hill before them as he spoke.

Katie waited a few moments before replying. 'I was wishing I could see something more of life,' she began at last in a low, hesitating voice, her eyes fixed contemplatively on the widening vista of moor and mountain land before her. 'I am so stupid and inexperienced. It is all right with our own people. But when strangers come'—— she broke off.

'So that's it, is it?' ejaculated the minister tersely. 'And I wonder what's put this childish folly into your head to-day of all days,' half-turning to glance quizzically at her. 'There was no shyness that I could see with the Laird when he called the other afternoon,' he continued in a dry tone. 'Nor have I observed any want of friendliness on your part towards my probationers when they come.' Then, as she still remained silent, he added in a sharper voice, 'Don't you take to roving too, Kitty,' tightening the reins unconsciously at the same time and impelling the mare to a trot at the steepest point of the hill.

'No, no; it's not that kind of roving I meant,' interjected the girl hastily, moved by the sudden note of anxiety in his voice. 'I am quite happy here with you. But some day, if we went together, it would be nice just to see what other places are like.'

'Well, well, who knows?' replied the minister in a mollified tone. 'And here we are at Ord. I must say the boy has done something for the place already,' as they turned in between the great gray pillars that formed the principal entrance, and drove along the short, well-kept approach, overshadowed by tall pine-trees, that led to the house. 'I hope it's not going to be a case of the new broom,' Katie heard him mutter under his breath the next moment, as if anxious to qualify his former praise.

Ellis was waiting for them in the porch, and gave them a hearty Highland welcome. Strange to say, as her eyes met his Katie's shyness vanished mysteriously. The frank, steady gaze under the level brows seemed to challenge her to prove herself what his fancy had already pictured her, and instinctively her spirits rose to the occasion.

'We will have luncheon first, and then you can look round you,' he said, limping ahead of them across the hall.

But a delighted exclamation from the girl brought him back to her side. 'How splendid!' she cried, gazing round upon the array of antlered heads and glistening ivory that adorned the sombre walls.

'Are they all your own killing, Ellis?' inquired the minister in a more dubious tone, surveying the trophies critically.

'Most of them,' returned the Laird. 'They represent a good many years of real hard work, too,' he added, with a short laugh.

'Work!' echoed the minister sarcastically. 'Call it play rather. I'm all for a man being a sportsman, but everything in its place. Now, you can have had no time for anything else,' taking another collective survey of the walls as he finished.

Katie glanced anxiously at her host; but, to her relief, she saw that his expression was one of grave attention. Evidently her father's strictures caused him no offence.

'You have left a blank place over the mantelpiece,' she hastened to interpose, drawing his attention to an empty recess above the carved oaken fireplace.

He turned immediately towards her. 'For my first Ord "royal,"' he informed her with a smiling bow.

'Ay; and you won't be long getting it either if report speaks true,' chimed in the minister enthusiastically. 'A shame that so many splendid heads have gone out of the country. But they're to be beaten, I hear, and you're the man to do it,' he said, slapping his host heartily on the shoulder.

The Laird and Katie exchanged a lightning glance of amusement. She was thankful that his tolerance enabled him to see, beneath her father's troublesome conscience and frequent want of tact, the real geniality and breadth of sympathy that distinguished him.

'It's very good of you, sir, and I'll do my best to live up to your expectations this summer,' he said, smiling. 'And now for luncheon.'

The meal passed off gaily, and afterwards the three adjourned to the large, airy room at the top of the house which the Laird proudly designated his museum.

He had certainly not overrated the value or interest of his collection; and even the minister was forced to acknowledge that his years of sport and adventure had not been so wasted as he had imagined. 'I never saw specimens better arranged,' was his summing up at the conclusion of the inspection.

'I have to thank my friend Usgood for that,' said the Laird quickly. 'He was with me on most of my expeditions, and all the scientific knowledge I possess I learned from him.'

'Another idler!' commented the minister, though there was a twinkle in his eye as he spoke.

'We will have tea in my den, if you don't mind,' said Ellis as he led them downstairs once more. 'The drawing-room I don't consider habitable in its present condition. But perhaps, afterwards, you wouldn't mind taking a look at it,' he said, turning to Katie, 'and giving me the benefit of your experience?'

She assented at once, hoping that the flush that

had mounted to her face at the suggestion had passed unnoticed by him. After all, it was only courtesy on his part to invite her assistance in the rearrangement of the room, she told herself. He would have made the same request to any lady visitor. Nevertheless, she could not help a feeling of gratification at the prospect.

(To be continued.)

SOME UNCONVENTIONAL SUPPERS.

DOCTOR JOHNSON was of opinion that a man seldom thinks with more earnestness of anything than he does of his dinners. Happily such serious consideration is not usually bestowed on the other meals of the day—suppers in particular.

The eighteenth century was the age of suppers; and when one had dined at four or five o'clock, a healthy appetite did justice later in the evening to a substantial meal which would offend every hygienic rule of the present day. In spite of a great physician's dictum that suppers kill more than doctors cure, the last decade or so has witnessed a great revival of the esteem in which the meal was formerly held, when the nightly crowds at the fashionable restaurants rival in elegance, if not in wit, the supper-parties of an earlier age. But hours are earlier, and lighter viands—partaken of to the lively strains of an orchestra—have taken the place of the steaks and kidneys and the baked potatoes of a more robust period.

Horace Walpole, writing in 1777, says: 'The present folly is late hours. Lord Derby's cook lately gave him warning. The man owned he liked his place, but said he should be killed by dressing suppers at three in the morning.' And George Selwyn the wit, a couple of years earlier, remarks: 'Last night and the night before I supped at Lady Betty Stanley's. Their suppers are magnificent, but their hours are abominably late. . . . We are very merry all of us, and I think Mrs North the merriest of us all. At two this morning the bishop and I were almost left alone; the rest of the company were in their dominos and going to the masquerade.' The following year he writes: 'I am just come from Almack's. Many are gone to the "Thatched House," to sup with the ladies, as they call it'—chief among whom was Lady Essex.

Some, however, even in those times, found a late meal to disagree with them. 'Don't you eat supper, sir?' asks Mr Edwards, an old friend of Johnson. 'No, sir,' replies the Doctor, who is feeling the responsibilities of age. To which his friend rejoins, 'For my part, now, I consider supper as a turnpike through which one must pass in order to get to bed.' We find Lord Byron writing to Moore from Venice, advising him not to indulge in beer or in porter, 'nor eat suppers—the last are the devil to those who swallow dinner.'

In Elizabethan days only two meals were usually taken. Men of all ranks dined at the ordinary and supped at the tavern. A supper which the Queen gave to the French ambassador was finished about nine. During the troublous times of the Civil War it became unusual to take supper, and the poorer middle classes after the Restoration took only a hot drink of buttered ale or a light meal. Those, however, who could afford it made a more substantial repast with fish or joint. Ben Jonson describes the joint of mutton ushered in by 'an olive, capers, or some better salad.' Lord-Keeper Guildford dined during term in Hall; but 'at night he desired the company of some known and ingenious friends to join in a costelet and a sallad at Chattelin's, where a bottle of wine sufficed, and the company devised their own feast, that consisted in friendly and agreeable conversation.'

Lord Eldon tells us in his *Anecdote Book* that dinner-hours had much changed within a few years. 'I remember the Duchess of Gordon asking Mr Pitt to dine with her at eight o'clock. He excused himself by saying that at that hour he was to *sup* with Dr Prettyman.' As consultations with solicitors were held in those days from six to ten at night, lawyers despatched dinner in time to begin their evening labours in chambers between six and seven. An invitation to sup at the Salutation and Cat Tavern on January 17, 1735–36, was issued by the stewards in a poetical form:

> SIR,—You're desir'd on Monday next to meet
> At Salutation Tavern, Newgate Street.
> Supper will be on table just at eight.

Here Coleridge and Charles Lamb were wont to sit smoking Oronoko tobacco and drinking egg-hot. 'I imagine to myself,' writes Lamb, 'the little smoky room at the "Salutation and Cat," where we have sat together beguiling the cares of life with poesy.'

Horace Walpole describes in his gossipy way a visit to Vauxhall one day in 1756, at the invitation of Lady Caroline Petersham, which was followed by an unconventional supper. The party went by river, 'a band of French horns attending;' and in the evening 'we minced seven chickens into a china dish, which Lady Caroline stewed over a lamp with three pats of butter and a flagon of water, stirring, rattling, and laughing, and we every minute expecting the dish to fly about our ears. She had brought Betty the fruit-girl, with hampers of strawberries and cherries from Rogers's, and made her wait upon, and then made her sup by us at a little table. It was three o'clock before we got home.' Very merry too, in a simpler fashion, must have been the supper-parties given by Goldsmith in the Temple to young folks of both sexes, which were preceded

by round games of cards, forfeits, and blind-man's buff, at which the poet enacted the Lord of Misrule. There is little wonder, however, that the learned Blackstone used to complain of the racket made overhead! Equally informal were the weekly parties given by Charles Lamb in Inner Temple Lane, when the supper of cold meat was always on the side-table, and every one might rise when it suited him and cut a slice or take a glass of porter without reflecting on the abstinence of the rest of the company. Lamb would perhaps call out and bid the hungry guest help himself without ceremony. Among the guests were to be met Wordsworth, Coleridge, Leigh Hunt, and Hazlitt, the latter of whom says: 'An utterly misinformed person might have supposed this a scene of vulgar confusion and uproar. While the most critical question was pending, while the most difficult problem in philosophy was solving, Philips cried out, "That's game!" and Martin Burney muttered a quotation over the last remains of a veal-pie at a side-table.'

Supper is *par excellence* the actors' meal, and a story attributed to Mark Lemon is told of the frequenters of a players' hostelry, who once a week indulged in a tripe-supper. Some of the actors getting tired of the plain fare, one of them suggested a change in the same. Accordingly, what appeared to be a splendid banquet was one night spread with much ceremony before their gratified vision; but, alas! the meats of all kinds—game, tarts, and so forth—were but the contents of a child's toy-box: wooden meats, wooden birds, painted apples. 'A cry of disgust, mingled with shouts of laughter, greeted this satire upon the actor's desire for luxuries; and after the first burst of surprise, Old —— in his loudest voice said, "Jim, bring in the tripe."'

We hear of Mr Creevy one night in 1805 having a supper of broiled bones at the Pavilion at Brighton, with the Prince of Wales, the Duke of Clarence, and the Duke of Norfolk, about one o'clock, 'the result of which was that, having fallen asleep myself, I was awoke by the sound of the Duke of Norfolk snoring, and found the Prince of Wales and the Duke of Clarence in a very animated discussion as to the particular shape and make of the wig worn by George II.' On another occasion in the same year, Sheridan, who on a plea of indisposition had not been present at the Pavilion ball, after the supper said to Mr Creevy, 'Will you go with me, my dear fellow, into the kitchen, and let me see if I can find a bit of supper?' and we hear that 'he ate away, surrounded by supper of all kinds, consuming a bottle of claret in a minute, with every one waiting on him. . . . He then returned to the ballroom, and when I left it between three and four he was dancing.'

George Selwyn, writing on July 23, 1774, tells us of an unconventional invitation he had received. 'We supped last night,' he says, 'at Lady Harrington's, the consequence of which is to eat a turtle on Tuesday at an alehouse on the Ranelagh Road.' This lady, the celebrated beauty, was the heroine of various escapades, among which was her championship of James Maclean, the gentleman highwayman.

Greville, in his journal for a Thursday in May 1835, gives a description more candid than polite of a 'Judy Party' at Horace Twiss's: 'A supper and jollification, where all were expected to contribute to the amusement of the company who possessed wherewithal.' Among the guests were Planché, Theodore Hook, and several ladies. 'I stayed,' says Greville, 'till two, and they went on till three. It was sufficiently amusing altogether, though noisy and vulgar; company very miscellaneous, but everybody ready to amuse and be amused.'

Theodore Hook had a recipe of his own to prevent being exposed to the night air, against which his doctor had emphatically warned him. He came from Fulham every day to Crockford's or some other place to dinner, and made it a rule on no account to go home again till about four or five in the morning. Supper at Crockford's, a very elaborate meal prepared by the famous Ude—called by Hayward the Gil Blas of the kitchen—was constantly replenished from midnight to early dawn. At Brooks's Club supper began at eleven and ended half-an-hour after midnight, the price being six shillings.

The House of Commons has at times the appearance of a supper-club. During a recent all-night sitting, we read that the dining-rooms were patronised all night. Plates of bacon, ham-and-eggs, devilled bones, soles, and so forth were supplied in their hundreds, while the beverages ordered totalled thousands of glasses.

Macaulay tells us that Lord Althorp, about the year 1830, used to dine at four, go down to the House at five, and never stir till the House rose after midnight. He then went home, took a basin of arrowroot with a glass of sherry in it, and so to bed, where he always dropped asleep in three minutes. 'Stanley laughed,' he goes on, 'at Lord Althorp's arrowroot, and recommended his own supper—meat and warm negus,' which, the historian informs us, he will begin to take when he feels a desire to pass the night with a sensation of swallowing a nutmeg-grater every third minute!

Turning to meals partaken of in graver surroundings, there is a curious incident told by Archibald Forbes of Bismarck after Sedan. Uniformed and booted to the thigh, he strode into the *salle à manger* of the little hotel in the Square of Donchéry, about eleven o'clock at night, with the announcement of the surrender of Napoleon. But his supper tarried. An officer ventured into the kitchen to forage for provisions for the Chancellor's meal, but the only food in the place was half-a-dozen dubious eggs. From a ham among the war-correspondent's stores were contributed sundry slices, and they and the dubious eggs were prepared for his supper. Between the kitchen and dining-room, however, the dish was cut out and carried off by a privateering Uhlan

officer; and it was not until after perquisition throughout the depleted little town that a beef-steak was found, on which the great man at last supped, washing it down with a bottle of Donchéry champagne. A grim repast was that which the same intrepid author partook of during the siege of Paris with some of his journalistic friends. The supper consisted of steaks of horseflesh, followed by *ragoût* of dog, and the few scraps of bread on the table consisted of a sort of dingy paste of which one-half was sand.

The late Mr George Herring, it is stated, was a frequent visitor at the Salvation Army shelters, and would make straight to the kitchen to get something to eat. On one such occasion, being accompanied by a party of friends, including several ladies, he ordered some soup, which he disposed of with the help of an old iron spoon. Having found it to his taste, he turned to one of the ladies, asking her to try it. But the fair visitor shrank at the very suggestion. 'The ugly iron spoon and rough-and-ready basin,' we read, 'did not commend themselves to her sense of refinement and good taste; whereupon Mr Herring remarked good-humouredly, "If you lived on food like this you would be looking better than you are to-night."'

In France in the eighteenth century supper was an institution held in high favour not only by the gay frequenters of the Court but by philosophers and the cultured ladies of the *salons*. 'Come and sup with me next Thursday,' says a French amphitryon to a friend. 'You will meet philosophers and literary men. Take your choice.' 'My choice is soon made,' was the reply. 'I will sup twice with you.'

Sydney Smith remarks unkindly of these times that a few women of brilliant talents violated all the common duties of life, and gave very pleasant little suppers. Large sums must have been spent on these entertainments. Five times a week, under the Duc de Choiseul's roof, the butler was wont to enter the drawing-room at ten o'clock and bestow a glance at the immense crowded gallery, and decide whether to lay the cloth for fifty, sixty, or eighty persons. 'At the *petits soupers* of Choisy,' says Rogers, 'were first introduced those admirable pieces of mechanism—a table and a sideboard which descended and rose again covered with viands and wines. The majestic nonentities were invited to dinner; the talkers, be they who they might, to supper.' Madame de Genlis, writing in 1782, tells of suppers followed by blind-man's buff, draw-dances (that is, where partners for the dance were *drawn* for, one supposes), and so forth, in which the fun was more boisterous than refined. Space would fail, however, to speak of the suppers at the Trianon and other festive entertainments of the *ancien régime*. They even survived the great upheaval, and it has been said that it was impossible to understand the Revolution without having supped at Barère's.

A PAWN IN THE GAME.

By W. H. Fitchett, LL.D., Author of *Deeds that Won the Empire, How England Saved Europe*, &c.

CHAPTER VII.—PARIS EXPERIENCES.

IN the months of neglect and of humiliation which followed, Jean was in the house but formed no part of the household. It would be difficult to imagine a more lonely figure. Madame treated him as non-existent. The major-domo's eyes, when Jean crossed his path, dwelt on him with a brooding and unintelligible purpose which the lad fiercely resented, and yet more than half-feared. He was the butt and sport of the servants, fed with the contemptuous disregard with which a dog might be fed, and allowed to sit silent and forgotten whole days and nights in his lonely room. Years afterwards the memory of those days would flush Jean's face with anger.

Denise was in a convent school, but her rare visits to the mansion were gleams of dazzling sunshine, for she always found her way to him, sometimes stealing with dainty footfall to the door of his room, or lying in wait for him in the corridors. The touch of her soft little hand, the eager affection shining in her eyes, the pitiful comprehending smile on the sensitive lips, were to poor Jean glad and enduring memories—the only thing, indeed, that kept him from utter despair.

To escape menial tasks and companionships in the house the boy took to the streets, and rambled for whole days through the network of foul alleys which lay to the west of madame's house. Here, at least, he escaped that atmosphere of contempt which scorched him like a flame under madame's roof. He formed strange friendships with the gamins of the street, learned their *argot*, took part in their sports and enterprises.

Over the Paris of that day, it must be remembered—the Paris of 1786–90—the thunderstorm of the Revolution was gathering. In the debates of the clubs, in the songs and catchwords of the streets, in the very sports of the gamins, a strange ferment was stirring. The thrill of some great change beginning to sweep over the land stirred men's hearts everywhere as the energies of the coming spring stir the fibres of every tree in a forest. It gave new fervour to hate, new edge to discontent, new passion to hope. The streets effervesced with fiery debates.

No scheme was too wild to find loud and eager advocates.

Jean rambled through the zone of slums that shut like a filthy girdle round the Tuileries. He knew every twist in the tangle of alleys which stretched from the Rue St Honore to the Place du Carrousal. The gloomy lanes of the Cité—the foulest spot in Paris, too deep in blackness for the sun to pierce, too narrow for cart to creep through—had an odd attraction for him. The network of cellars along the river-front—rat-holes in which, like filthy and half-starved rodents, a population of a hundred thousand people burrowed, flooded out with every rise of the river—was his familiar haunt.

Betwixt the wintry unkindness of madame's house and the foulness of Paris slums the poor lad oscillated in this fashion. If his character had been destroyed by the play of such evil forces, and he had disappeared, swallowed up of darkness, it would not have been strange. Perhaps M. Duclos hoped for this. It would have disposed of a possible claimant to madame's fortune. And madame herself silently consented to this. Jean's disappearance would have delivered her from a face that, in spite of herself, awoke a certain disquiet.

But somehow the lad survived. He kept the stubborn manliness which was the gift of his English blood. And he kept better things than even it—a hate of falsehood, a touch of boyish and unconscious piety—gifts to him from his dead mother. Her memory, the unfading vision of her face, the echo of her teaching, the sense of what would have pleased her and what grieved, acted as restraining forces. She had taught his conscience a tenderness and an authority which survived even the evil environment in which Jean now lived.

God interprets Himself to the human soul in many ways; and to Jean, as to many another English lad, his mother's face, remembered still in spite of death, became itself a sort of conscience. He saw right and wrong through his dead mother's eyes. His will took a more stubborn bent against evil whenever he thought of her.

London, meanwhile, grew faint to Jean. A certain shame made him reluctant to write, and the occasional letters his aunt wrote to him M. Duclos took care never reached him. That mysterious gentleman, too, contemplated with keen dislike the friendship betwixt Denise and Jean, and what he disliked was very apt to come to an uncomfortable end. The boy was always conscious of the darkened brow, the evil look of meditative dislike with which M. Duclos regarded him; but the frown grew darker, the glance more evil, as it became clear that Denise's love for her comrade survived his disgrace, and even took a new and more tender glow from it.

Much of the political passion stirring in Paris eddied round Madame Laurente's house. The Girondist leaders were familiar figures in her *salon;* and, as the factions had not yet come to open war, the representatives of every shade of politics rubbed shoulders in madame's drawing-room. Jean, watching from his dark perch at the summit of the stairs, heard sometimes from the *salon* the deep, compelling voice of Mirabeau, and later that other great voice of the Revolution, resonant as the sound of a bell—an alarm-bell, for choice—that of Danton. Danton's face, with its cinder-black eyebrows and features curiously flattened as though crushed, became familiar to him. M. Duclos had subterranean relationships with the darker and fiercer spirits in the political world of Paris, and sometimes representatives of the Left came to madame's *salon.* So Jean became familiar with Camille Desmoulins's voice of flute-like sweetness—a voice distilling gall in spite of its sweetness. He came to know the lifted face, the small pointed features, the compressed lips, the green, short-sighted eyes, the receding forehead of Robespierre, with his fixed and artificial smile, his nervously fluttering eyelids and bile-tinted complexion.

One day, as he rambled in the Palais Royal, Jean's eyes fell on an odd, undersized figure in the uniform of a *sous-lieutenant* of artillery. The big head was out of proportion to the short body; the slender legs were thrust into boots so high and wide that their owner resembled Puss-in-Boots. But as this odd figure came near, the dark Italian features, with their tint as of dead gold, the frowning brow, the eyes out of which a challenging discontent looked, seemed curiously familiar. It was his Corsican comrade of Brienne, '*Paille au nez*,' his chin a little higher in air, if possible, than ever.

With the impulse of frank comradeship, Jean ran forward to greet his friend, then stopped. The young officer had stopped too, and was contemplating with a look of angry astonishment the street gamin who, with eager face and outstretched hands, approached him. Then he recognised Jean.

'Ah, Jean,' he said, looking at him from head to foot with a glance that made the lad freshly conscious of his shabby clothes, 'you are, then, no soldier!'

This was clear enough, but the English lad found it hard to explain what he was. With the eager curiosity of youth, he plied his old Brienne companion with questions about his own doings.

Yes, Napolione had finished with the military school. He hated it, he declared with frowning emphasis. It was worse than Brienne. The other cadets were insolent; they were stupid; they were purse-proud. He had got his commission in the regiment of La Fere. He was to join it at Valence.

'It is a beginning,' he said; 'it is the first step. My destiny will declare itself.'

Jean, with his blunt English common-sense, smiled at the thin-legged, short-bodied *sous-lieutenant* who talked so confidently of his 'destiny.'

His companion, with his uncanny swiftness of glance, saw the smile, read its meaning, and flashed out imperiously, 'You smile! Nobody will smile at me ten years hence.'

And Jean, looking at the piercing eyes, the commanding brow, of the other, felt his smile fade. A compelling magnetism lurked in the eyes of this strange officer of artillery, something that made doubt or contradiction very difficult. 'Destiny' and the young artillery officer, with his boots too absurdly big for his thin legs, did after all seem to be on surprisingly intimate terms with each other.

Napolione meanwhile was looking afresh at Jean. 'You are unhappy,' he said bluntly. 'You are in disgrace still. But,' he added, with a sudden and fierce gleam in his eyes, 'why did you not make an end of Chambon? A word would have done it. He came on to Paris, and was more hateful than even in Brienne.'

'But the word would have been a lie,' said Jean stubbornly.

Napolione's gesture was magnificent. 'A lie is sometimes a useful weapon. What soldier is ashamed of his bayonet?'

Jean shook his head, and the other grew scornful. '*Mon ami*, I would help you. And the time will come,' he added, with an upward tilt of his chin which reminded Jean of Brienne, 'when I can help you. But you must be practical. What has put a gamin's blouse on your shoulders instead of a cadet's coat? It is what you call truth. It is your simple-minded incapacity to use words as a swordsman uses his blade.'

Jean went away from him feeling chilled and sore, yet fascinated afresh. His old Brienne comrade seemed to have forgotten that it was Jean's boyish loyalty to him which had spoiled his career. He had wasted on Jean no word of sympathy, yet the spell of his challenging eyes and his energy of purpose made the English lad feel towards him almost like a slave towards a master. He could give up everything to him—except his conscience. And it was precisely his conscience which was the point of divergence betwixt the two lads.

CHAPTER VIII.—'THE RATS.'

THE chief interests of Jean's life at this time lay in the friendships and enmities born of his street wanderings, and some of these were very odd. The Paris gamins of those days, when the great city was stirring through every lane and alley with the ferment of the coming revolution, were of a special type. The political passions of the day soaked through to even their dens. They had their clubs, their policies, their watchwords, their leaders, their wars with rival bands.

The dim and filthy regions which lay about the Tuileries were infested by a swarm of gamins organised into a band under the title of 'The Rats.' Jean's ramblings through their territory attracted their attention, and began to be watched with jealous eyes. One evening Jean was confronted by an odd figure in ragged dress and unwashed face, but with an air of strutting arrogance that contrasted absurdly with his rags.

'What are you doing here?' demanded this strange figure.

Jean stared at his questioner with silent wonder.

'I'm the Rat,' said the ragged youth with an air of indescribable pride, 'and this is my district. The Rats do not love strangers and spies;' and he glared fiercely at Jean.

There was something rodent-like in the slanting eyes and pointed chin of the Rat. Jean had noticed him before, and admired the speed and soft-footedness with which he could slip down some dark lane or cellar and disappear. Jean's cool silence, even more than his steady eyes and his evident preparedness for battle, seemed to chill the Rat's ardour for instant combat, and with a gesture of menace, as though threatening open war, he disappeared down the nearest lane. But from that moment Jean found himself exposed to incessant onfalls and ambushes whenever he crossed the zone of streets betwixt madame's house and the Palais Royal. He lived the life of a hunted animal.

The Paris of that day, however, was subject to extraordinary changes in sentiment, changes marked by tropical fervour and rapidity. One morning the Rat suddenly presented himself to Jean's astonished eyes and made a partially successful attempt to fall on his neck and embrace him.

'*L'Anglais*,' he cried, 'England and France are sisters. England is free, and France will get rid of her kings and priests and set an example of freedom to the world.'

Jean stared at the little ragged figure who talked in accents borrowed from some orator of the pavements, and evidently regarded himself as the representative of France and Jean as that of England, and was prepared to conclude a solemn league and covenant of peace on the spot.

England and all things English had for the moment become the rage in Paris. English costumes made their appearance in every street; English habits were copied; English phrases became passwords; English carriages thronged the Champs-Elysées; English racers ridden by English jockeys contended for prizes at Longchamp. The very riders in the Boulevards wore English breeches and top-boots, and rose in their stirrups in what was believed to be the English fashion. The English Constitution was discovered to be the last word of political wisdom. Paris temporarily became Anglomaniac, and the new craze filtered through to the very gamins. This explains why the Rat attempted to fall on Jean's neck and announced an eternal

brotherhood with him. The Paris of the gutters was mimicking the Paris of the clubs and the Boulevards.

Jean accepted the new terms of peace with the same cool philosophy that he had shown under the old conditions of war. But his league with the Rats introduced him to strange aspects of Paris life. The Rats of Jean's neighbourhood lived on terms of truceless strife with the organised gamins of the surrounding districts. Their days and nights were filled with traps, ambuscades, fierce sallies, feigned retreats, the cutting off of stragglers, the plunder of their enemies' supplies, &c. Jean was at first scorned by his new comrades for his apparent stupidity and jeered at for his clumsiness. But his unfailing coolness, his gift for straight hitting, and his mysterious faculty for fighting with serene cheerfulness against overwhelming odds aroused the wondering admiration of the Rat and the whole band.

In madame's house, as in the school at Brienne, a certain impassiveness lay on the boy's features like a mask. He seemed slow of wit and clumsy in body. It was an unconscious and self-protective disguise. But in the companionships of the streets the mask slipped aside; he showed himself curiously alert and inventive. He never forgot a street through which he had once passed, a face he had once seen, a voice he had once heard. A faculty for command awoke in him.

The Rat himself could plan a campaign with much ingenuity, but when the moment of actual combat came his genius failed, he fell into the background. It was Jean who led the onfall or covered the retreat, or singled out the captain of the hostile force in combat and seldom failed to overthrow him. The Rat was never tired of gazing at Jean's sturdier limbs with admiring envy. And he admired the English lad for gifts which he himself did not possess—his frank, if slow, speech; his cool genius in battle. So that, to his own astonishment, Jean found that he became a sort of unacknowledged leader amongst the Rats.

Sometimes Jean's influence was strong enough to restrain the imp-like performances of the Rat and his band. In the Feuillants, not far from the Tuileries, stood a bookshop, its little windows aflame with the political caricatures of the day. Jean had somewhere in his blood a love of books, and his feet often lingered in front of the windows of M. Toulan's shop. The wife was kindly. The shopkeeper himself, a quick-eyed, hot-tempered southerner, was for some reason in open feud with the Rats, who broke his windows and threatened to raid his establishment. M. Toulan, on his part, retaliated energetically, darting out from his shop, stick in hand, on any Rat or group of Rats that came within range of his vision. M. Toulan was an active politician; his flattened, prize-fighter-like nose showed him to be of a combative temper, and he was a somewhat formidable figure in the agitated scenes of that stormy time.

Jean one night discovered that a raid of a serious sort, which the Rats seemed anxious to keep from his knowledge, was on foot. This made him curious, and he succeeded in discovering that it was levelled against the flat-nosed shopkeeper in the Feuillants and his kindly wife.

The Rats had chosen their time well. It was a winter night; the streets, as was usual in those wild times, were empty. Sudden gusts of rain whipped the pavements and roofs of the city. Toulan was at his political club. Suddenly the Rats broke in on the shop like a swarm of South American peccaries; the terrified woman was seized, her shrieks were silenced with threats, and the Rats began to spread themselves on errands of plunder and destruction over the house.

Just then there lounged into the ill-lit shop from the dark and windy street a figure that seemed tall amongst the undersized gamins intent on their work of mischief. Hands in pockets, the newcomer strolled across the shop floor, turned, and looked at the startled Rats. His appearance had arrested their malign activity. With loitering deliberation, not taking his hands out of his pockets, the new-comer—it was Jean—drawled out the words, 'You had better go. Madame,' he said with a jerk of his head towards the astonished woman, 'is my friend.'

Jean, as he spoke, looked around with eyes of lazy command. The slow and careless sentences seemed to paralyse the Rats.

'The wolves of the Halle-au-Blé,' Jean went on, 'are on a raid to-night.'

An angry growl ran through the gamins as they listened, for the 'wolves of the Halle-au-Blé' were a rival band with whom the Rats were in deadly feud.

'We will catch them,' Jean continued, 'in the Rue de Grenelle. Come,' he said; and, still with hands in pockets, he strolled towards the door, casting a friendly glance at the woman as he went.

The Rats hesitated, but their leader was following Jean without a question, and they swarmed out into the streets after him. Whatever was the fate of the struggle with the 'wolves,' M. Toulan's shop and his wife escaped harm.

Jean shunned that shop for the next few days, but at last he met M. Toulan. The shopkeeper clapped his hand on Jean's shoulder. 'Little one,' he said, and his keen eyes shone with gratitude, 'you saved my wife and my shop, and Toulan is your friend to the death.' And, later, Jean found that friendship singularly useful.

The lad's life had some odd changes. Madame was capricious. She shunned meeting Jean as far as possible, but when they met his face affected her curiously. She was descending the stairs one evening in dainty dress to her *salon*, Denise by her side, when she met Jean climbing the stairs to his lonely room. His dress was neglected; on his sunless face lay an expression of dogged endurance. Madame

looked at him as he shrank to the side of the stairs, and the accusing eyes of the boy seemed to sting her.

'Send him away,' she cried sharply to M. Duclos, who was following her.

'Let him go to school, mamma,' said Denise with a look of pity.

'Yes, to school—anywhere,' exclaimed madame, and she swept on with a gesture of her hand and a shudder of her white shoulders as though dismissing Jean into space.

Jean accordingly found himself swept, as in a whirlwind, to the first school that offered. It was a dingy building in the Rue St Jacques, where its head, M. Lepitre, ruled over a little community of restless boys.

M. Lepitre was a queer figure, short-necked and short-bodied, with goggle eyes and a fringe of white hairs on his head standing on end round a circular disc of mere crimson baldness as though charged with electricity. M. Lepitre, whatever his faults, was a scholar. He would roll out Latin hexameters in a voice of thunder and as though he relished each syllable. He was a politician more than a schoolmaster, and drew his politics from Greece and Rome, and adapted them to local use; for in those days every schoolroom was a political forum. M. Lepitre lived amongst Plutarch's characters, and had imagination enough to be himself a hero, but unhappily lacked both mind and body for the rôle.

He did not understand boys, and his pupils stung and tormented him like so many gadflies. But the goggle eyes were kindly, and they won Jean. Here was one at least who did not look askance at him as though he were a criminal, or dwell on him with a gaze so dark that it seemed to be hiding murder under its gloom. M. Lepitre, indeed, was oddly kind to Jean.

'You are stupid,' he would say; 'you will never learn; *mais vous êtes un gentilhomme.*'

But Jean could learn, in his silent, slow, unforgetting fashion; and M. Lepitre's teaching, if it found him, in spite of his neglected dress, with some of the instincts born of gentle blood, helped to keep these alive. But after a few months the school somehow came to a sudden end. M. Lepitre's pupils found the politics of the pavement more interesting than the lessons of the schoolroom, and flew like a covey of wildfowl into space. Jean drifted back once more to madame's house, to the lessons of the streets, and to the society of gamins.

(To be continued.)

POWDERED MILK.

THE SOLUTION OF A SERIOUS PROBLEM.

By FREDERICK A. TALBOT.

ONE of the most perplexing social-economical problems of the day, and one which is taxing the resources of the scientist to a supreme degree, is in connection with the purity of our milk-supply. The significant importance of this question cannot be overestimated, since this article constitutes one of the most essential in the diet of all classes of the community. There is no other foodstuff which can be considered a substitute for milk in its various applications, nor at the same time is there any other article in the category of food which is so difficult to handle. Legislation restricts adulteration either for preservative or colouring purposes. Yet the greatest dangers do not lurk in the mere addition of extraneous materials, but are purely of an inherent nature. No other food is so extremely susceptible to contamination, liable to quick changes or sour fermentations. This fact is all the more strikingly emphasised in hot weather or in tropical regions, where the obtaining of fresh milk is a matter of great difficulty.

What is the reason? Fresh milk of the average quality consists of approximately 88 per cent. of water, in which the solid food-substances are dissolved and suspended, and among the latter there is that most subtle class, the albuminoids. It is perfectly obvious that the presence of such an overwhelming proportion of water in the milk offers a highly suitable dumping-ground for all descriptions of bacteria, which thrive and propagate among the suspended solid food-substances to an alarming degree. Moreover, such a high percentage of water militates against the cheap or easy transportation of the article. Various efforts to preserve the liquid from contamination or fermentation without the addition of chemicals have been attempted, but have been attended with only mediocre success; and it is a notable point that the housewife's simple remedy of scalding the milk immediately it is received still remains the most successful, and indeed forms the basis of the famous pasteurising process, which is now so commonly practised in Continental countries. Yet such procedure is one upon which the medical authorities agree to differ; and only recently Sir Thomas Barlow advocated not a scalding but a refrigeration treatment for preserving the article — in which advice, however, the housewife after a little experience may not readily concur.

But the scientist realises that, after all is said and done, neither scalding nor refrigeration entirely solves the problem. This can only be accomplished

by the removal of the excess of water either partially or entirely. If the technical literature upon the subject is studied it will be observed that inventors have been striving towards this end since about 1830, in which days the question of milk contamination and preservation was equally as acute as it is to-day; but their success, so far as concerns the total elimination of the water and reducing the solids to a powder which could easily be redissolved when required, was very slight. The lack of suitable appliances rendered the cost of such treatment too prohibitive to be of any commercial value. Foiled in this main direction, inventors then devoted their energies to the partial elimination of the water, and condensed milk was the result, though it was not until 1860 that it came into vogue. As is well known, this substance is a thick liquid, the addition of cane or beetroot sugar imparting certain preservative qualities to the article sufficient to enable it to constitute a handy form of milk in hot climates. By this means the proportion of water to solids is reduced from 88 and 12 per cent. to 60 and 40 per cent. respectively, a large proportion of the former, however, being sugar. The one great objection to condensed milk, however, is its general sweetness, which renders it somewhat monotonous as a daily food in hot climates.

During the past few years a decided impetus has been imparted to the evolution of an economical process for the preparation of milk in a concentrated form. The powder is obtained by pouring or passing the fresh milk over a heated plate or rolls, the water being driven off in the form of steam, leaving the solids encrusted upon the surface, from which they are removed by scraping. Such a system, however, possesses many disadvantages, the greatest of which is that the character of some of the previously suspended solids is quite altered under the influence of the heat.

In 1901 great interest was aroused by the reading of a lecture before the Academy of Agriculture in Stockholm by Dr M. Ekenberg, an eminent Swedish scientist and food-expert, in which he described details of a process he had devised two years previously for the production of a soluble dry or powdered milk. The feature of this invention was that the process of manufacture was effected upon entirely original lines, for which he had evolved a special apparatus; and the dairy interest of the country—the milk industry is one of the most important in Sweden—was so impressed by the possibilities of the process that the invention was given a practical trial, which has been attended with success.

The *modus operandi* is very simple. The milk is first submitted to straining through a cotton filter; its temperature is then reduced to nearly freezing-point, preparatory to drying. Pasteurisation is here carried out in compliance with the law—that is, if it has not already been so treated at the dairy, which is the general procedure in the country before delivery. The crux of the invention lies in the comparatively low temperature at which drying is completed, this being effected at blood-heat, or about one hundred degrees Fahrenheit. The drying appliance consists of a revolving cylindrical drum known as the exsiccator, lined with nickel, which has been found to be the most suitable metallic substance upon which to deposit the milk solids, since the other commercial metals have not sufficient resistance against the chemical action of the milk. The fluid is fed into this drum, through which is carried simultaneously exhaust steam, which in its passage carries off the water in the milk. The ends of the drum are bowl-shaped, whereby rapid and high efficiency in the evaporation of the water is obtained, this evaporation extending to about four-fifths of the original amount. The evaporative efficiency is very high, being from three to four hundred pounds per hour per square yard of surface, while, moreover, conversion is carried out with great rapidity; these ends being secured by keeping the milk in constant circulation. With the exsiccators now in operation, from one thousand seven hundred to two thousand one hundred pints of milk are converted into powder per hour, the steam consumption averaging from ·94 to ·99 pound per pint of milk. The milk-powder deposited upon the nickel surface of the drum is scraped with white-metal knives into a special receptacle placed at the mouth of the exsiccator, and is then immersed in the crystallising chamber, and maintained there for about an hour in a temperature ranging from eighty to one hundred degrees Fahrenheit, or until the sugar of milk has crystallised. The milk-powder upon its exodus from this chamber somewhat resembles castor-sugar, and is of a brittle nature. It is then milled like flour, after which grinding and sifting it is ready for use.

At first sight it appears to be but a simple operation to obtain the dissolved solids in milk in a powdered form by merely driving off the accompanying water in the form of steam; but in practice it is an extremely difficult matter, since the application of heat, unless carefully controlled, completely destroys the nutritious properties of the component parts of the fluid—which fact can easily be ascertained by simply redissolving the dried powder in water. It must be remembered that natural milk consists of a serum in which the casein and fat-globules are suspended. Consequently, it is apparent that should the heat be improperly administered to the fluid the nourishing fat-globules will be completely destroyed. Moreover, another easier test can be applied to such redissolved milk to ascertain whether or not its original nature has been impaired in any way by drying, and that is by the addition of rennet. According to Dr Fuld, a German scientist who carried out a series of investigations upon this point with a large variety of milk preparations, he found, with one exception, that cheese could not be made from powdered milk under test, thereby testifying conclusively to the

fact that the inner constitution of the milk was completely altered by the drying process. With the Ekenberg milk-powder, however, he ascertained that upon restoration to its natural state by the simple addition of water, in which it is readily soluble, cheese could be made therefrom.

When it is redissolved, the difference between the article and natural milk cannot be distinguished except for perhaps a slightly boiled flavour; but inasmuch as pasteurised milk can also be detected by the same peculiarity, it is impossible to state whether the original article has been dried or simply subjected to precautionary pasteurisation.

In many drying processes the addition of certain chemicals is adopted. They are stated to be harmless in character when used in moderation, but their presence, in infinitesimal quantities notwithstanding, is sufficient to impair the natural constitution of the product. Whether any such treatment has been made can be simply verified. If the restored milk—water in which the milk-powder has been dissolved—is permitted to stand, and no chemicals have been previously added, in the space of some two hours a slight sediment will be observable at the bottom of the vessel, this consisting of albumen that has coagulated during the pasteurising process. This sediment cannot be avoided; in fact, the experiences of later years have established the fact that pasteurised and dried milk in restored condition must give such a sediment. If no such result is to be seen, the fact that chemicals must have been added is incontrovertibly testified, and it is perfectly obvious that the substance has deteriorated.

Another feature of Dr Ekenberg's discovery which will appeal to the farmer is that skimmed milk can be turned to equally commercial value. During the past few years the dairy industry has been completely revolutionised mainly by the introduction of the centrifugal skimming-machine. By this means it was rendered remuneratively practicable for the farmer to carry out the manufacture of butter upon his own premises, thereby avoiding the heavy transportation charges inseparable from the conveyance of the new milk in its bulky form to the butter-making centres. At the same time, however, the milk after passing through the separator constituted practically a waste product, and on the Continent, as well as in this country, was virtually valueless except for feeding cattle. The practical utilisation of the skimmed milk has been a vital question in dairy circles for a long time past, since the milk after separation still contains the most valuable parts from a physiological point of view, as the separator completely removes all the natural impurities in the fluid.

Attempts to produce cheese from the separated milk proved abortive, while the manufacture of casein was handicapped by the limited demand for this latter article. Only about 3 per cent. of the milk in the form of casein could be extracted, leaving some 6·3 per cent. of valuable nutritious solids to be wasted. In Sweden and Denmark, however, this waste product is now being turned to commercial advantage, as the exsiccator quickly and cheaply extracts the small quantities of solids remaining in the skimmed article. Naturally, such milk cannot be used for those purposes for which ordinary milk is generally employed, owing to the deficiency in fat and cream; but at the same time it is perfectly suitable for the preparation of numerous cereal foodstuffs, such as biscuits, cakes, &c., and for general cooking purposes. It is in this direction that the Continental farmers are now reaping a great advantage, since a double profit is now obtainable: one, and the largest, from the butter, cream, or cheese; and the other from the sale of the separated milk, which, though a small one comparatively speaking, is yet preferable to discarding it as waste. Such milk, where the fat percentage is low, is easily soluble in cold water—an important factor solely attributable to the vacuum system of drying—and consequently entails little trouble in its preparation for cooking.

In this country milk-powder is not so widely known or appreciated as on the Continent or in the United States, where it is now coming into a wide vogue. The possibility of storing such an article—which in its raw state is extremely sensitive—like flour for an indefinite period, without any apprehensions as to fermentation, souring, or deterioration, is fully realised. It solves in the most complete form the difficulties attending hygienic milk-supply. The powder is bacteria-proof, as Professor W. Booth of Syracuse (New York) has distinctly proved. As the result of a complete investigation on this subject, wherein a quantity of milk-powder was exposed to the air in a temperature ranging from sixty to sixty-five degrees Fahrenheit for a week, no colonies of bacteria in suitable strata mixed with the dry milk were observable. This fact is probably attributable to the bacteria-destroying influence of the serum-enzyms of the milk during concentration in the vacuum, whereby the enzyms are kept in full activity. Experience on the Continent has shown that owing to the low cost of manufacture (which approximates only one-sixteenth of a penny per gallon—recouped in the lower cost for transportation due to the powdered product occupying only one-tenth of the bulk of natural milk) it is attended by no increase in price to the consumer. At the same time, it brings within the reach of the poorer classes of the community the skimmed article, which is a perfect food, and is even maintained by some scientists to be purer than the whole milk, owing to the cleansing action of the separator, as already mentioned. The condensed article, while very convenient for storage and handling so long as it is kept air-tight, is yet but an efficient substitute. One pound, when dissolved according to the directions, yields about 1·6 quarts of fluid milk, as it contains only some 40 per cent. of milk substance; on the other hand, milk-powder, which is composed of 98·5 per cent. of milk sub-

stance and 1·5 per cent. of free moisture, will give, when dissolved, 3·5 quarts, or nearly one gallon, of milk as similar as possible to the natural article.

It is obvious that despite the precautions observed in the handling, transportation, and delivery of fluid milk in sterilised churns and air-tight and germ-proof glass or paper bottles, owing to its extreme susceptibility to contamination, such methods cannot compare from the point of hygiene with the system of distribution in a concentrated powder-form, which is absolutely germ-proof. It is in this direction, it would seem, that the true solution of the maintenance and purity of milk distribution is to be found.

WOBURN PAST AND PRESENT.

By the Rev. A. J. Foster.

THE ancient name of abbey still clings to many of the old estates and houses where the monks once lived; and though such estates have oftentimes changed hands, yet the title reminds us that they were once the property of ecclesiastics. Woburn Abbey is no exception to this rule, for the mansion of the Russells is known at the present day to all who live around the little town of Woburn as the Abbey.

The Abbey itself was founded in the year 1145, its founder being Hugh de Bolebec, who acted, it is said, at the suggestion of the head of the great Cistercian house of Fountains in Yorkshire. There is probably truth in this, for Woburn came into existence as a religious house of the Cistercian order, and so continued for nearly four hundred years. The history of the Abbey resembles that of most of the similar institutions in our country. It had its monastic life and its connection more or less with the outside world; but what has chiefly come down to us of its history is that of occasional disputes with the civil power as to certain feudal rights, and other things which concerned owners of manors in medieval times; for Woburn was a large and important establishment, with its privileges of punishing malefactors even with the gallows, as became the foundation of such a noble Norman knight as Sir Hugh de Bolebec. It is interesting to note that Sir Hugh's son, another Hugh, apparently relinquishing the manors with which the Conqueror had rewarded his father, assumed the monastic habit, and founded another Woburn Abbey, or cell, as a smaller establishment was called, on the banks of the Wyck, in the adjoining county of Buckingham.

Some would place the halo of martyrdom round the head of Robert Hobbes, the last abbot. His abbey seems to have been well ruled, and his monks to have been good livers; but those were the days of plunder, and Hobbes had to surrender his abbey, in common with the heads of all other religious houses in the kingdom, into the hands of King Henry VIII. But the fate of Abbot Hobbes was tragic. After the dissolution he appears, together with certain of his fellow-ecclesiastics, to have taken up arms against the king, which was a foolish thing to do, for Henry was tolerably powerful; and the end of it was that he was hanged, tradition says, in the park itself on an oak-tree, still pointed out, not very far from the present mansion.

For a time Henry and his son Edward did what they pleased with the abbatial estates; but the latter granted them to a remarkable man who had well served his father and his grandfather, John Russell, the first Earl of Bedford. Nor was this the only grant of Church property which that fortunate man received at the hands of his sovereign.

How far the earlier Russells made Woburn their dwelling-place is hard to say. They had another estate, Chenies, in Buckinghamshire, which came to the family by the marriage in 1536 of Earl John with Anne Sapcote, the heiress of that pleasant spot; and Chenies continued to be their residence for a time. The fine old mansion there, restored by Earl John, still remains; and the bodies of departed Russells are laid to rest in the burial-chamber built in 1556 by Anne Sapcote on the north side of the church. At the present time there is not a single fragment remaining of the Abbey buildings at Woburn, and only one small fragment of a later house erected on its site. This house had been built or partly rebuilt by Inigo Jones, but it was all swept away with the exception of one panelled room to be found in the basement, to make room for the magnificent mansion erected about 1745 from the plans of Henry Flitcroft, the designer of St Giles-in-the-Fields and St Olave's Churches in London.

We have spoken of the house as magnificent, and that is perhaps the best adjective to apply to it. Whether it is beautiful is another matter. It is, of course, built in the classical style, which was the rule in the middle of the eighteenth century. The west front, which overlooks the lake, is over two hundred feet in length, and has an Ionic pediment over the principal entrance, and two wings which are perhaps rather heavy. Our classical architects never seem fully to have understood the necessity of light and shade when dealing with a long front. The other fronts, we may say, are plain to a degree.

The house is, however, more fortunate in its arrangements than in its architecture, and it is to the interior that we may the more properly apply the word 'magnificent;' and it is when we are within it that we are able to form an idea of the

size of the modern Woburn Abbey. On the outside, the large park and the lofty trees somewhat detract from its greatness. The house is built round a quadrangle, with the principal or state rooms on the west side; and a beautiful view of the park is to be had from their windows. Here are the apartments occupied by Queen Victoria and the Prince Consort when they paid a visit to Woburn many years ago. The rooms usually occupied by the family are on the south side, and look into a very pretty garden. Round the inner side of the quadrangle run corridors, and here hangs the greater part of that collection of portraits for which the Abbey is famous. Hayter's picture of the trial of Lord William Russell, so well known, at least from engravings, hangs, however, in the Queen's bedroom. Other mementos of this patriot are his stick and a copy of the speech which he delivered at his execution, both of which hang on the walls of one of the corridors. He also appears as a boy of seventeen in a portrait which hangs in the Prince Consort's dressing-room. But in attempting a general description of Woburn Abbey we must leave the pictures, only remarking that there are many other works of the highest importance besides portraits, notably a fine collection of twenty-four views in Venice by Canaletto. In the western saloon also are to be found works by some of the greatest masters, for here hang specimens of the brush of Rubens, Murillo, Rembrandt, and others. The miniatures also form a very remarkable collection, a detailed description of which would exceed the bounds of any magazine article.

No one artistically minded visits Woburn without going to see the sculpture, which is grouped together in a gallery by itself outside the house on one side of the garden towards the east. Here, besides sculpture, is a splendid mosaic from the villa of Hadrian; and the Lanti vase, a huge *cratera* or gigantic wine-cup, is well known to connoisseurs in these things. The gardens along and beyond the south side have been a good deal added to and ornamented during the last few years; and here, too, is the quaint Chinese dairy, with its curious china from the East. Of European china there is abundance in the house itself—dinner-services of great value, and many remarkable specimens from the best potteries of England and of the Continent.

But the park at Woburn is as famous as the house itself on account of its size, its beauty, and the way in which it is kept up. There is no park of like extent in the county of Bedford, or, indeed, in the southern Midlands. And this park has in the last few years acquired a new interest in the eyes of all lovers of natural history. The present Duke, who is President of the Royal Zoological Society, is a keen student of animal life, and has gathered together within his domain a most interesting collection of birds and beasts. The woods shelter a remarkable collection of pheasants, hybrid and otherwise; the ponds and lakes contain specimens of various sorts of waterfowl; and the park itself, so beautifully undulating in its character, has been divided into various enclosures for the accommodation of animals chiefly of the deer tribe. In a vast enclosure, some twenty miles in circumference, there is, as may be well understood, plenty of space for animals to roam, even though it is necessary in some cases to keep the different species separate. The diversity of hill and dale, of pasture and of wood, of lake and of stream, affords the suitable habitation for each resident of the animal world who is so fortunate as to find a home in Woburn Park.

The large enclosures or immense paddocks which form the dwelling-places of most of the animals are to be found on the northern side of the park. They are divided one from another by stout and lofty iron railings, and at various parts are located the feeding-troughs and hay-racks, with their attendant fodder-bins. It is only necessary to give a rattle with the lid of one of these bins to ensure the gathering together of all the animals in the enclosure. Upon hearing the sound they quickly move up to the railings.

Amongst the animals in Woburn Park the most stately and magnificent is the bison. There are several fine bulls belonging to this species of the ox tribe, and these wander majestically over the pastures, accompanied by their cows. The climate of Bedfordshire appears to agree with them very well; their manes are full and thick, and their shaggy black hides are healthy-looking. They turn rather wild eyes towards and glare at the strangers who venture to visit them.

But the deer-tribe are the class most fully represented in the Duke's collection, and they may be counted by hundreds. The naturalist who takes up this particular class of animals for study will revel in the large amount of subjects here set before him. They roam about in herds or in some cases singly. One specimen is pointed out to us, a foreign red stag of uncertain temper, who, having attacked and nearly killed a man, has been exiled in the bison-pen away from his fellows. Even the inexpert visitor who is unable to distinguish with exactitude between European, Asiatic, African, or American specimens, and does not know the difference between a wapiti and a swamp-deer, cannot fail to be struck with the diversity of the horns which he sees branching out from the heads of the animals before him. There are antlers of every description, though in most of those which are fully developed we find the familiar series of *brow*, *bay*, and *tre*. Perhaps the covering of the horns—or velvet, as it is called—hangs on them a little longer into the summer than it would if the animals were in a perfectly wild state. Of course, where there is such a large herd, the number of shed horns which can be gathered in the spring is enormous. Huge heaps of them lie in the yards round the various buildings in which the animals are sometimes housed. The more valuable specimens are carefully sawn off and

preserved, and very fine specimens they are. As one looks up at a line of stags standing on the sky-line of one of the ridges in the park, one wonders that an animal so small in comparison can carry the branching mass which stands up above him. It is also to be noted that in some species the female carries the horn as well as the male. This appears to be the case where the horn is a straight one of spiral form.

But there are many other animals besides bisons and deer to claim our attention. There are several specimens of that strange animal the African gnu, which appears to the unlearned visitor to be something between an ox and a horse, his hair and his long tail resembling that of the latter animal. One fine bull of this species develops the characteristics of a third animal. Annoyed by an inspection of him from the outside of the railings, he snorts and lashes his long white tail, and then suddenly breaks into a series of short, sharp yaps like a yelping puppy, and concludes the performance by an exhibition of the rocking-horse motion of a buck-jumper. That animal would be worth a good deal to a travelling circus if he could be persuaded to go through his tricks with regularity. There are camels also moving heavily over the turf, which must be difficult footing for them and unlike the sands of the East. Some charming little Brahman cows, the sacred cows of India, walk gently about their paddock. A pair of graceful giraffes stretch down their long necks over the lofty railings of their enclosure to allow us to stroke their velvet noses.

The water-birds are located in the lake nearer the Abbey, but a few specimens of winged creatures are to be found in the enclosures with the animals. Ostriches and rheas strut about on their long, powerful legs. Cranes and other birds with lengthy members are also to be seen, as well as landrails and bustards.

Nor must the dogs be forgotten. There are fine specimens of a breed raised by a judicious crossing of mastiff, bull-terrier, and greyhound. By the side of these are many fine Scottish deerhounds. These are used for the purpose of rounding up the deer.

Next to the excellence of the collection itself, perhaps what strikes the visitor to Woburn the most is the care shown for the comfort of the animals. The keepers' houses are placed in the midst of the paddocks, so that they can easily attend to all the wants of their charges, and all the arrangements for the feeding are worked on a system of complete regularity. In some cases an attempt has been made, and not unsuccessfully, to provide an animal with his natural surroundings. For instance, in the enclosure of the Indian swamp-deer a large crag composed of limestone and local sandstone has been erected, on which the animals can climb or into the fissures of which they can retire at pleasure. Sometimes specimens arrive from the Zoological Gardens in Regent's Park for breeding purposes. One thinks these fortunate creatures must be happy to exchange north London for the breezy heights of Woburn Park.

The noble owner of Woburn has found a use for the park, or at least a portion of it, of which the Cistercians of old would never have dreamed; but in these days of world-wide intercourse zoological collections are more feasible, more appreciated, and, we may add, more useful than they were in days of yore. Many a young man with time and money at his disposal goes out in search of big game nowadays, and returns with a large stuffed collection, and perhaps with a few mementos of his exploits in the shape of sundry scars, the result of scratches and bites received in his sporting exploits. The Duke of Bedford has brought back to his own country the living animals themselves, for we believe he made the first beginning in this, one of the most remarkable collections belonging to a private owner, during his travels in India some years ago.

No large landowner is more alive to his responsibilities than the Duke of Bedford, and it was a happy thought, and now more than a thought, on his part that, having both the opportunity and the means for so doing, he should have accomplished so much for the study of zoology. It is true he is not the first landowner who has formed a collection at home—the late Lord Lilford had a splendid show of birds in his Northamptonshire park; but he is the latest, and we trust that as years go by further additions will be made until Woburn Abbey becomes a well-known name among zoologists of all nations.

ON BEHOLDING THE FIRST WINTER SNOWFALL ON ZERGHUM MOUNTAIN, IN BALUCHISTAN.

O Mountain! in what pomp of purest white
Hath dark-browed Winter draped thy monster form;
Making of thee a haunt dazzlingly bright
Where she may brood, and breed such sudden storm
As shall leap forth upon these fertile plains
To wreck our springtime hopes or autumn gains!

So unapproachable art thou, so grand
In high disdain and hidden causeless hate,
That, overshadowing this lowly land,
Thou seem'st the stern embodiment of Fate,
Denying happiness to us that plan,
Toil, hope, and fail here through life's fleeting span.

Let me remember—if ever despair
Darken my life with hopeless-seeming gloom,
And tempt my soul to say, 'God heeds no prayer,
So cold is He, careless what cruel doom
Pursues His weak creations, toiling men
That weep and pray'—let me remember then

That from thy crags, to mortal foot unknown,
Thy rocky chasms where the tempests breed,
Harvested of the winter's snow alone,
Those constant streams of healthful waters speed,
Without whose grace these fruitful plains would lie
Desert and lifeless 'neath a burning sky.

THE LOVE-STORY OF QUEEN VICTORIA.

By Henry Leach.

We did know that her affection for her Consort was a great and a splendid thing that dominated the whole life of Queen Victoria from the day when the marriage was arranged. We knew that the spirit of Prince Albert tinged her being and her existence and her every action, and we thought that the publication of a portion of her correspondence would disclose something of a beautiful story. It has done more than that. Through the long account of domestic matters and serious affairs of State in the three volumes of *The Letters of Queen Victoria: 1837–1861*, which have just been published by Mr Murray under the authority of the King, and with the editorial assistance of Mr A. C. Benson and Lord Esher, there is woven one of the most thrilling, passionate, and pure royal love-stories that have ever been. The histories of the love-episodes of a king or a queen will always have a close attraction for the multitude, but this one will not merely satisfy a common and somewhat vulgar curiosity. It reveals a fine fervour, a beautiful simplicity, and an earnestness and purity that make one glad again that England could be ruled by such a good woman. These three volumes give rise to many thoughts, some of them at times a little conflicting; and there are many separate stories, histories, romances, biographies, disclosures, &c., all pounded together in a hotch-potch of correspondence arranged in chronological order. The ingredients of another of them may be separated for a second article on this remarkable work; in the meantime the love-story of Queen Victoria as now told in these letters, as it never has been and never could have been told before, is a stirring thing to read.

The larger part of this story is told in the letters that passed very frequently between her and her uncle Leopold, the King of the Belgians. The latter achieved his kingship in 1831, accepting an offer of the crown of Belgium after it had previously been refused by Louis-Philippe, and when he had himself in the previous year withdrawn from an acceptance of the throne of Greece, owing chiefly to the financial straits in which Greece found herself just after obtaining autonomy. He was the youngest son of Francis Duke of Saxe-Coburg-Saalfeld, and the days of his youth were spent in the Russian military service. On two or three occasions he displayed conspicuous gallantry on the field. In 1816, when he was twenty-six years of age, he married the Princess Charlotte, only child of George IV., and for a long period his home was at Claremont, where the little Princess Victoria spent much of her holidays, and came to regard her uncle very affectionately—almost, as it is said, in the light of a father. On his part, an enlightened and large-minded prince, with a deep consciousness of monarchical duty, he took the closest interest in the training of the little Princess Victoria from the beginning, and was constantly solicitous of her welfare in all respects. It was, indeed, suggested that he had cherished the hope that he might be named as Regent if a Regency had become necessary. Some evidence of the fact that his interest in the little Princess was of a reality that did not cease at spoken or written expressions of concern and regard is afforded in the fact that for many years he subscribed between three and four thousand pounds a year towards the expenses of her education and that she might have the advantage of certain holidays at the seaside which were regarded as necessary, at a time when the parliamentary grant made to the Duchess of Kent was unequal to the increasing expenses of her household.

This short statement will serve as a brief introduction to a man whose place in our English history some may not hitherto have been disposed to regard as of much importance, but who evidently had not a little to do with shaping the destiny of our monarchy at a very important period. For, let it be said that while other high authorities had other solutions to suggest to the deeply important question as to whom the future ruler of Great

[*All Rights Reserved.*]

Britain should choose as her Consort, the idea of her union with Prince Albert of Coburg originated with him, and he prosecuted it with much earnestness until it came happily to be realised. His first move in the matter was his arrangement that Prince Albert and his elder brother Prince Ernest should pay a visit to the Duchess of Kent at Kensington Palace; but the state of things was such that King William naturally opposed a design which he knew was approved by his sister-in-law. Therefore, at the same time William invited to England the Prince of Orange and his two sons, and allowed it to be understood that he favoured the candidature for the hand of the little Princess by the younger of the brothers, Prince Alexander. It is believed, indeed, that he went so far as to say that no other marriage should ever take place, and that the Duke of Saxe-Coburg and his son should never put foot in the country, that they should not be allowed to land, and that they must return whence they came.

* * *

This is in 1836, the year before the Princess succeeds to the throne, and thus at the outset there is something of romantic piquancy in the inevitable scheming for the award of the Princess's hand, which is not detracted from by the circumstance that the Prince of Orange looks upon King Leopold with no friendly eyes, because the former had sought the Princess Charlotte in marriage. He declared on one occasion that Leopold had robbed him both of a wife and a kingdom! But the little Princess is no doubt to some extent predisposed in favour of her Coburg cousins. A testimonial concerning them is sent to her from Stuttgart in April by the Princess Hohenlohe, who writes: 'You will like our two Coburg cousins also, I think; they are more manly than I think the two others are, after the description. I am very fond of them both. Ernest is my favourite, although Albert is much handsomer, and cleverer too; but Ernest is so honest and good-natured. I shall be very curious to hear your opinion upon them.' Then, when the King of the Belgians hears of the attitude of King William, he writes in great indignation upon it to his niece, permitting himself to observe that he has never heard or seen anything like it, that he hopes it will rouse her spirit, and that he does not comprehend why her lot alone should be to be kept 'a white little slavey in England' for the pleasure of the Court, who never bought her, as he is not aware of their ever having gone to any expense on that head, or the King's even having spent a sixpence for her existence. And Leopold also has not the least doubt that William in his passion for the Oranges will be excessively rude to the relations of the Princess, which, however, will not signify much, as they are her guests and not his, and will therefore not mind it!

So some of the preliminaries to this match-making are a little stormy; but the cousins duly arrive in England in May, and then for the first time, so far as we are made aware, the Princess makes any reference to the matter, which she does in a letter she sends almost immediately to her uncle in Belgium, who may be imagined to be not a little anxious as to her first impressions of her young relatives. All is well at the outset, and there is a disposition in favour of Albert. 'My cousins are most delightful young people,' she writes. 'I will give you no detailed description of them, as you will so soon see them yourself. But I must say that they are both very amiable, very kind and good, and extremely merry, just as young people should be; with all that, they are extremely sensible and very fond of occupation. Albert is extremely handsome, which Ernest certainly is not, but he has a most good-natured, honest, and intelligent countenance.'

The Princess's regard for Prince Albert ripens rapidly; for a fortnight later, when the cousins, accompanied by their father, leave England on a visit to King Leopold, she writes to the latter (Prince Ernest carrying the letter with him) in terms of great enthusiasm. 'I must thank you, my beloved uncle,' she said, 'for the prospect of great happiness you have contributed to give me in the person of dear Albert. Allow me then, my dearest uncle, to tell you how delighted I am with him, and how much I like him in every way. He possesses every quality that could be desired to render me perfectly happy. He is so sensible, so kind, and so good, and so amiable too. He has, besides, the most pleasing and delightful exterior and appearance you can possibly see. I have only now to beg you, my dearest uncle, to take care of the health of one now so dear to me, and to take him under your special protection. I hope and trust that all will go on prosperously and well on this subject of so much importance to me. Believe me always, my dearest uncle, your most affectionate, devoted, and grateful Niece.' Clearly the future Queen is in love, and in her girlish happiness is disposed without delay to regard her future as settled, and the delight of the King of the Belgians is in a way evidenced in the circumstance that in future letters he addresses her as 'My dearest and most beloved child,' whereas previously the simple superlative 'My dearest child' had sufficed.

Thenceforth, though her sentiments may not change, she perceives the desirability of maintaining a perfect discretion and reserve in the development of this most delicate and important affair, as the national aspect of it begins to appeal to her, whereas at the first moment there was only the happy individual one to think of. So far as the published correspondence is concerned, the Princess makes no further reference to the possibilities of her domestic future until she succeeds to the throne, and only once or twice in her letters to the King of the Belgians makes casual mention of her cousins—casual and reserved, but still always most kind and sympathetic.

Then comes the death of King William IV. and

the accession of Queen Victoria. In the spring of 1838, when so many weighty affairs are in occupation of the young Queen's mind, her thoughts fly to a project for the training of Prince Albert for the office and responsibility of Consort, and of making a special test of his capacity for the difficult position. It is a delicate task, but perhaps a necessary one, and it is the good Stockmar who is called in for its accomplishment. With the knowledge and consent of the Queen, King Leopold commissions him to accompany Prince Albert on a tour in Italy with the objects just stated. Writing in April, Leopold observes to Her Majesty: 'Concerning the education of our friend Albert, it has been the best plan you could have fixed upon to name Stockmar your commissary-general; it will give *unité d'action et de l'ensemble* which otherwise we should not have had. I have communicated to him what your uncle and the young gentleman seem to wish, and what strikes me as the best for the moment. Stockmar will make a regular report to you on this subject. They will return to Bonn at the beginning of May, and remain till the end of August. . . . I agree with this, as nothing enlarges the mind so much as travelling. But Stockmar will best treat this affair verbally with you. The young gentleman wished to pay me another visit at the beginning of May, prior to their return to Bonn. Nothing definite is, however, as yet settled about it. On one thing you can rely: that it is my great anxiety to see Albert a very good and distinguished young man, and no pains will be thought too much on my part if this end can be attained.' Such is the tact and capacity of Stockmar that the mission is quite a success, and he becomes the most confidential and trusted of all the Prince's advisers. There are many letters in existence from the one to the other which plainly show that Stockmar never shrank from speaking the plainest truth to the Prince, when he considered it to be necessary, on matters of duty and faults of temperament, without, as it is said, any courtier-like attempt to blink criticism that might have been unpalatable. This was characteristic of him.

With the coronation over and rapidly becoming an event of the historic past, and the Queen settled down to the serious business of her reign, it is natural and inevitable that some more serious consideration shall be given to the question of her alliance, although she professes, and with sincerity, that she is disinclined personally to change her state for the present, and that the nation has made no suggestion to her that it expects anything of the kind. So, when it is arranged that her two eligible cousins shall pay her another visit in the autumn of 1839, we find her writing with some little show of nervous anxiety to her uncle Leopold, and disclosing to him her feelings with more exactness than formerly. 'I shall send this letter by a courier,' she writes, 'as I am anxious to put several questions to you, and to mention some feelings of mine upon my cousins' visit, which I am desirous should not transpire. First of all, I wish to know if Albert is aware of the wish of his father and you relative to me? Secondly, if he knows that there is no engagement between us?' There is not a little naïveté in one of these questions at any rate; for Albert—after his recent travelling education, and all the talk that he must have had with Leopold—can hardly be in any doubt as to the wish of the latter and the general family gossip upon the subject. But it is characteristic of this absorbing correspondence that while the woman seems always to be effaced by the monarch, severe, dignified, practical, when she is discussing affairs of State with her Ministers—save occasionally in her intimate confidences with Melbourne—the femininity of the young girl so wisely trained, in all its warmth and weakness and occasional inconsequence, is foremost and dominant when intimate domestic matters such as this one of her future marriage are the subjects of discussion. She rules as a queen, but she loves like a simple, most charming woman; although we discover her making one feeble, futile attempt to conduct her love affair—as she seems to have put it to herself—as a queen ought to do. In this same letter from which we have just been quoting she goes on: 'I am anxious that you should acquaint Uncle Ernest that if I should like Albert I can make no final promise this year, for, at the very earliest, any such event could not take place till two or three years hence. For, independent of my youth, and my great repugnance to change my present position, there is no anxiety evinced in this country for such an event, and it would be more prudent, in my opinion, to wait till some such demonstration is shown, else if it were hurried it might produce discontent. Though all the reports of Albert are most favourable, and though I have little doubt I shall like him, still one can never answer beforehand for feelings, and I may not have the feeling for him which is necessary to ensure happiness. I may like him as a friend, and as a cousin, and as a brother, but not more; and should this be the case (which is not likely), I am very anxious that it should be understood that I am not guilty of any breach of promise, for I never gave any. I am sure you will understand my anxiety, for I should otherwise, were this not completely understood, be in a very painful position. As it is I am rather nervous about the visit, for the subject I allude to is not an agreeable one to me. I have little else to say, dear uncle, as I have now spoken openly to you, which I was very, very anxious to do.'

At this point one may be permitted to anticipate to the extent of saying that within a fortnight of Prince Albert's arrival in this country on this visit the Queen informed Lord Melbourne of her engagement to him, and shortly afterwards the Privy Council received official intimation. So much for the 'repugnance' and impossibility of deciding that year, and the necessity for awaiting a sign from

the country! So much, indeed, for the delightful failure of the Queen in the matter that of all others must appeal to her as a woman; and one may be sure that, if it had been fully cognisant of all the circumstances, the country that was to give the sign would have given it with much enthusiasm, and would have loved its girl Sovereign the more for this feminine inconsistency.

There is no further reference to the important cousins in this correspondence until October 12th, by which time they have arrived, and then the Queen tells Leopold that 'Albert's beauty is most striking, and he is so amiable and unaffected—in short, very fascinating; he is excessively admired here.' Three days later she precipitately writes to her uncle to tell him that it is all settled! 'My mind is quite made up—and I told Albert this morning of it,' she declares. 'The warm affection he showed me on learning this gave me great pleasure. He seems perfection, and I think that I have the prospect of very great happiness before me. I love him more than I can say, and I shall do everything in my power to render the sacrifice he has made (for a sacrifice in my opinion it is) as small as I can. He seems to have a very great tact—a very necessary thing in his position. These last few days have passed like a dream to me, and I am so much bewildered by it all that I know hardly how to write; but I do feel very, very happy.' She adds that some secrecy must be maintained about the event until after the meeting of Parliament. In England, only Lord Melbourne is told, and he quite approves, and considers the match eminently desirable. 'We also think it better,' she adds, 'and Albert quite approves of it, that we should be married very soon after Parliament meets, about the beginning of February; and, indeed, loving Albert as I do, I cannot wish it should be delayed. My feelings are a little changed, I must say, since last spring, when I said I couldn't think of marrying for three or four years; but seeing Albert has changed all this.'

Leopold is naturally much pleased, seeing that a great object which he has pursued through many difficulties and disappointments is at last achieved, and his present sentiment is that of Zacharias: 'Now lettest Thou Thy servant depart in peace!' In her ecstasy the Queen writes to him again: 'Oh! dear uncle, I do feel so happy! I do so adore Albert! he is quite an angel, and so very, very kind to me, and seems so fond of me, which touches me much. I trust and hope I shall be able to make him as happy as he ought to be! I cannot bear to part from him, for we spend such happy, delightful hours together.' Then the Queen proceeds to inform a few relatives of her determination, receives many congratulations, and settles down in a business-like way to arrange the many serious and important matters that have to be determined with regard to the establishment of a Prince Consort in the country. The Prince is requested to give particulars of the religion of his ancestors in order that the English people may be convinced he is nothing of a Catholic; and Her Majesty, anxious as she is to please him, finds it necessary to be firm on the point that she and not he must appoint the gentlemen of his household. After much controversy all round, it is agreed that he shall not be made a Peer. In the midst of it all she writes to King Leopold in the early part of December to say: 'I was quite miserable at not hearing from Albert for ten days; such a long silence is quite unsupportable for any one in my position towards Albert, and I was overjoyed on receiving yesterday the most dear, most affectionate, delightful long letter from him. He writes so beautifully, and so simply and unaffectedly.'

Then it is all bustle and happiness and joy until February 10th, when, amid great popular rejoicings, the royal marriage takes place. On the morning of the nuptials the Prince receives a pretty note from his bride: 'Dearest, . . . How are you to-day, and have you slept well? I have rested very well, and feel very comfortable to-day. What weather! I believe, however, the rain will cease. Send one word when you, my most dearly loved bridegroom, will be ready.'

The day after the marriage an ecstatic letter with many underlinings and capitals is penned from Windsor Castle by the Queen-wife to the King of the Belgians: 'I write to you from here, the happiest, happiest Being that ever existed. Really, I do not think it possible for any one in the world to be happier, or as happy as I am. He is an Angel, and his kindness and affection for me is really touching. To look in those dear eyes and that dear sunny face is enough to make me adore him. What I can do to make him happy will be my greatest delight. Independent of my great personal happiness, the reception we both met with yesterday was the most gratifying and enthusiastic I have ever experienced; there was no end of the crowd in London and all along the road. I was a good deal tired last night, but am quite well again to-day and happy.'

From this happy period one may go forward lightly over the years, and notice here and there the satisfaction and the fullness of life that are being experienced by the matron Queen. In so far as her domestic affairs are concerned it is roses all the way for more than a score of years, and now and again in a message to some beloved friend or kinsman she gives vent to the joy that is within her always by a song of her happiness and the blessedness of it. When the heir to the throne is born that constant confidant, good Leopold, reads this that comes to him from Windsor Castle: 'Oh! my dearest uncle, I am sure if you knew how happy, how blessed I feel, and how proud I feel in possessing such a perfect being as my husband, as he is, and if you think that you have been instrumental in bringing about this union it must gladden your heart! How happy should I be to see our child grow up just like him!' A year and a half afterwards the Queen writes to him telling him how visitors have indeed been struck with the likeness

of the young Prince to his father, and in a rhapsody she exclaims: 'Indeed, dearest uncle, I will venture to say that not only no royal *ménage* is to be found equal to ours, but no other *ménage* is to be compared to ours, nor is any one to be compared, take him altogether, to my dearest Angel.'

And with the years increasing the happiness does but seem to increase also; and at last, when the silver wedding is celebrated in 1861, another letter is sent to Belgium which speaks of the great consummation of happiness: 'On Sunday we celebrated, with feelings of deep gratitude and love, the twenty-first anniversary of our blessed marriage, a day which has brought us, and I may say the world at large, such incalculable blessings! Very few can say with me that their husband at the end of twenty-one years is not only full of the friendship, kindness, and affection which a truly happy marriage brings with it, but the same tender love of the very first days of our marriage!' Alas! this was the climax and almost the last of the wedded joy.

* * *

Before that year had run out to its end the happy scene was extinguished in a melancholy darkness. The Prince Consort died.

What at first seemed to be but a little rheumatism, an insignificant chill, developed seriously, and a few days before Christmas the Queen became a desolate, broken-hearted widow.

In the poignancy of her grief she wrote thus to Leopold: 'My own dearest, kindest father—For as such have I ever loved you!—The poor fatherless baby of eight months is now the utterly broken-hearted and crushed widow of forty-two! My life as a happy one is ended! The world is gone for me! If I must live on (and I will do nothing to make me worse than I am), it is henceforth for our poor fatherless children—for my unhappy country, which has lost all in losing him—and in only doing what I know and feel he would wish, for he is near to me—his spirit will guide and inspire me! But oh! to be cut off in the prime of life—to see our pure, happy, quiet, domestic life, which alone enabled me to bear my much disliked position, cut off at forty-two—when I had hoped with such instinctive certainty that God never would part us, and would let us grow old together (though he always talked of the shortness of life)—is too awful, too cruel! And yet it must be for his good, his happiness! His purity was too great, his aspiration too high for this poor, miserable world! His great soul is now only enjoying that for which it was worthy! And I will not envy him—only pray that mine may be perfected by it and fit to be with him eternally, for which blessed moment I earnestly long.'

It happened sadly that Lady Canning died just at this time, and with this great bond of deep sympathy made between them the Queen wrote to the Earl a kind message of soulful condolence. 'To lose one's partner in life,' she said, 'is, as Lord Canning knows, like losing half of one's body and soul, torn forcibly away—and dear Lady Canning was such a dear, worthy, devoted wife! But to the Queen—to a poor, helpless woman—it is not that only—it is the stay, support, and comfort which is lost! To the Queen it is like death in life. . . . May God comfort and support Lord Canning, and may he think in his sorrow of his widowed and broken-hearted Sovereign—bowed to the earth with the greatest of human sufferings and misfortunes! She lived but for her husband! The sympathy of the many thousands of her subjects, but above all their sorrow and their admiration for him, are soothing to her bleeding, pierced heart!'

And then, as like the change from the dejected dirge of the middle of a funeral march to the spirited passage that marks the exaltation of the soul, there seemed to come from the depths of this gloom the brave cry of hope and faith and everlasting constancy that would shine as a bright light for the rest of life. At the end of this story, in letters of the reign of the Queen up to 1861, there is yet another letter to King Leopold, written from Osborne on Christmas Eve, and it fittingly marks the end of the earthly period of the Queen's love-story: 'I must write these few lines to prepare you for the trying, sad existence you will find it with your poor, forlorn, desolate child—who drags on a weary, pleasureless existence! I am also anxious to repeat one thing, and that one is my firm resolve, my irrevocable decision, viz. that his wishes—his plans—about everything, his views about everything, are to be my law! And no human power will make me swerve from what he decided and wished—and I look to you to support and help me in this. I apply this particularly as regards our children—Bertie, etc.—for whose future he had traced everything so carefully. I am also determined that no one person, may he be ever so good, ever so devoted among my servants, is to lead or guide or dictate to me. I know how he would disapprove it. And I live on with him, for him; in fact, I am only outwardly separated from him, and only for a time. . . . Though miserably weak and utterly shattered, my spirit rises when I think any wish or plan of his is to be touched or changed, or I am to be made to do anything. I know you will help me in my utter darkness.

'It is but for a short time and then I go—never, never to part! Oh! that blessed, blessed thought! He seems so near to me, so quite my own now, my precious darling.'

A PAWN IN THE GAME.

CHAPTER IX.—THE ESCAPE.

JEAN had been uneasily conscious for some time that when by chance he met M. Duclos that gentleman's eyes dwelt upon him in a meditative way that showed some special purpose of evil was ripening in his plotting brain. When that purpose crystallised into action an instinct warned Jean that it would mean a plunge into new disasters for him. So sure was he of this that it hardly surprised him when he awoke one morning to see M. Duclos standing by his bedside with a look of triumph in his deep-set eyes.

'An English lad,' he said, with a visible relish in every word, 'is degraded by nature; but I did not know that the son of your father could steal.'

Jean's eyes were still heavy with sleep, but as he listened, and the meaning of the words crept to his brain, a spark of anger woke in them, and anger made the lad bold. He leaped from his bed and confronted the major-domo with a steady look.

'Yes,' said M. Duclos sternly, 'you have stolen madame's jewels. They were missed, and were found concealed in this room—at least part of them—and for a thief the only place is the Châtelet.' Then, without waiting for a reply, he went out, locking the door after him.

The sound of the bolt as it was shot into its socket sent an icy vibration through Jean's heart. What plot M. Duclos had woven, or what device against him he had on hand, Jean could not guess, but he never doubted that it would be carried through successfully. To be accused of theft! And the evil brain that planned the accusation would provide the evidence to sustain it. Jean felt, as he meditated on it all, as though shame scorched him like fire.

The hint of the Châtelet, too, thrilled him with dread. Of all the prisons in Paris this was the one most feared. Its dark, frowning mass, set in a brown sea of slums, was a familiar sight to Jean. An atmosphere of cruelty lay about it. To be whipped for theft, and buried alive in the black depths of that ill-omened building—Jean knew that this meant his disappearance; it might mean death itself. What would they think of him in London when they heard the story?

Presently his stubborn English courage awoke. Why should he wait till M. Duclos returned with the gendarmes? He would flee. He would get somehow to London; and, as he called up the picture of his aunt's face, he felt sure she would refuse to believe this evil tale of theft.

All the lad's wits were now busily at work. To escape from madame's house was not impossible, but to tramp from Paris to the seaboard, to cross the Strait, to reach London—these were tasks which might well daunt even a stout heart. Jean's heart was stout enough, but his pockets were empty and he was friendless. The Rat could not help him in this business. Jean could see no plan as he sat brooding over the problem, with bent head and stubborn courage, all through the lonely day till the darkness of night crept into the room.

He lay down at last and slept, but his sleep was broken. Presently he woke. The house was silent; he could not guess the hour, and in the dark he began meditating afresh over the problem of escape. The faint chime of a far-off church bell striking midnight reached him, and still he sat turning over one plan after another.

As he sat, staring with unseeing eyes into the gloom, he became aware of a faint film of light that seemed to creep under the bottom of the door. He heard no sound of steps, but the stain of light grew fuller. Then there came the slow creak of the lock, and his door was gently pushed back. Jean's nerves had grown tense with expectant fear, but it was Denise who stood there.

A hood was drawn over her head, her feet were bare, she carried a tiny candle in her hand, and in the disc of light her face—the pure white features, the shining and steadfast eyes—showed with startling effect. To Jean it seemed like the face of an angel. Had one of the saints whose pictures hung in madame's drawing-room stepped out of its frame, stolen a candle, and crept up through the darkness to visit him? But there was on Denise's features a very human look, an expression of girlish yet resolute purpose such as no artist could put into the countenance of a painted saint.

Jean had the scorn natural to his age and sex of a girl's courage, or want of courage. But as he stared at the slender figure, the steady eyes, the little hand that grasped the candle, the dainty brow knitted into characters of resolve, he felt that here was a courage which a soldier might envy. What generous daring this slender girl had shown to form a plan for his escape, to secure the keys, to climb in the midnight darkness to his door in order to set him free! For that Denise came to release him Jean knew in a moment without words.

'I heard mamma and M. Duclos talk together,' Denise whispered, and then the words died on her quivering lips.

Jean nodded comprehendingly. 'I shall make for London,' he said; and at this Denise in turn nodded with brief assent.

They whispered for a few moments together, but the darkness chilled them, and their very whispers seemed to run through the long, dim corridor as though they would awaken the household. There was no need for explanation and no time for loitering. Jean took the slender fingers in his hand with wordless gratitude. Denise felt that the touch

of the strong, warm hand holding hers so tightly was better than a caress, and meant more.

'We shall meet yonder, in London,' said Jean, he hardly knew why, and it was with a conviction that came to him he knew not whence.

'Good-bye,' he whispered again, and moved away in the darkness. He stopped, after taking a few steps, and came back. He drew from some inner pocket a little book and thrust it into her hand.

'Mother gave it to me,' he said; 'it is all I've got.'

It was a little Testament with bent and broken covers and many signs of use, the gift to Jean of tender hands now lying in the dusty grave. It was the boy's one treasure. With instinctive tact, Denise took the little book without protest. She knew all it represented. Jean was giving her the most precious thing he possessed.

'Yes,' she whispered, 'I'll love it for your sake.'

Jean went down a few steps, then turned and looked back again. To his dying hour he never forgot the picture offered by the figure of the girl. Her face in the flame of the candle showed clear-cut like a cameo. A pity wordless but inexpressibly tender burned in her shining eyes. She smiled, in silent answer to his look, a smile that showed in the sudden gleam her white teeth. Then Jean passed out of sight, swallowed up in darkness, and Denise was left to creep back to her room.

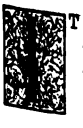
Jean knew enough of the house to find his way out of it. He reached the street, stole through its emptiness, and stood a moment at the corner of the Rue de Grenelle. The dark night lay about him. The dark city was before him, in which there was not a roof to give him shelter. Beyond was the long, unknown road to the sea, the problem of crossing, the tramp to London. But Jean was of a fine courage, and he lingered for an instant ere he plunged into the tangle of sleeping alleys to reflect with a sense of humour how M. Duclos would find the nest empty and the bird flown when he came up to his room in the morning.

Mrs Robert Lawrence was sitting by her comfortable fireside in London, many weeks afterwards, when a maid entered and said, 'A boy wants to see you, ma'am.'

Mrs Lawrence went out into the hall, and saw a ragged boy, with broken boots and unwashed face, standing there, and her eyes ran over him with suspicious scrutiny. It was another street-beggar, and she drew her skirts more closely about her. The dusty, unwashed figure was an offence to the sacramental cleanliness of her house. Presently the boy lifted his face slowly with an odd shyness, and said, 'Auntie.'

Mrs Lawrence stared a moment longer with uncomprehending eyes; then her lips began to tremble. She understood.

'Oh John, John!' she cried, and she kissed him and wept over him, her tears running afresh and her exclamations becoming more broken every time she glanced at the ragged dress, the thin face, strangely old for its years and written over with signs both of hunger and suffering.



'Oh that Frenchwoman!' at last she cried with a sudden vehemence, at which Jean laughed.

She asked no questions, but she never doubted that it was madame's wicked arts that sent back poor Jean a hungry, footsore, and ragged fugitive to her door. Then her housewifely instincts awoke. Jean—or John, as she instantly insisted on calling him—was carried off to a hot bath and to clean garments, and set down to a supper during which even his youthful hunger toiled in vain to meet the dainties his aunt's care spread before him.

After supper he told his story, his uncle listening in angry silence and with knitted brows, while his aunt punctuated the tale with the oft-repeated and indignant cry, 'Oh that Frenchwoman!'

(To be continued.)

AN ITALIAN GOLD-MINE.

It was early in July, and the hotel was deserted, for—with the exception of a chance English mountaineer arriving *viâ* one of the mountain passes—no one comes to stay at Macugnaga until August. Then the hotels are filled with Italians from the plains of Lombardy, who have fled to the mountains to escape the heat; and there is generally much dancing and singing every evening, for there are always cool, refreshing breezes at Macugnaga, and ninety degrees in the shade at Rome generally means fifty-five degrees in the shade there. I had found it too hot at Stresa, and had left the nightingales to the fireflies by the lake, only to find myself too early and alone in a large, bare hotel, and under the care of Padre Oberto, who was acting as *locum-tenens* for his relative the proprietor, away in Verona. My bedroom had a good view of Monte Rosa from its window; and on my arrival I found the good priest seated there conning his breviary, and so made his acquaintance, and was able to induce him to give me his company at the hotel dinner-table.

On my journey up the valley I had noticed a board with the legend, in English, 'The Pestarena Gold-Mining Company, Limited;' and, thanks to the somewhat polyglot conversation in which the padre exchanged ideas with me, I gleaned a good deal of information about the gold-mines, and eventually obtained an introduction to the overseer of one of them, and was enabled to inspect it.

The valley—called the Val Anzasca—runs laterally from the Italian end of the Simplon road, and from Piedimulera to Monte Rosa, where it ends

in the six hamlets comprising the amphitheatre called Macugnaga. It is only twenty miles long; but it takes nearly six hours to drive up it, for Macugnaga is five thousand one hundred and fifteen feet above the sea, and Piedimulera only eight hundred and ten. In the first mile one ascends nearly four hundred feet; and the road, winding up the great defile, high above the left bank of the roaring and rushing Anza, is a magnificent piece of engineering. Nearly all the way one sees the pure white mass of Monte Rosa closing in the mountains which form the sides of the Val Anzasca, and always the scenery is overpoweringly grand, without that sternness which characterises so many of the Swiss valleys. For we are in Italy, as the masses of flowers, tiers of trellised vines, and groves of chestnut, mulberry, and walnut trees we encounter in each successive village remind us. And those villages, with their whitewashed houses and tall campaniles perched on every plateau, are charming and (for Italy) cleanly beyond compare. The churches are splendidly decorated and frescoed inside—so much so that one wonders whether a good deal of the gold found in the valley has not been spent for the purpose. Only near the mines of Pestarena—where a mountainous block of stone has fallen, and compels the Anza to find its way round it—do the impending mountains become stern and threatening. Even at Macugnaga itself the balconied and trellised houses, with their store of picotees and carnations, smile gaily in the centre of eight or ten tremendous peaks, four of which are the summits of Monte Rosa herself. Only Italy could give the wealth of mosses, ferns, and flowers which accompany one the whole way.

There are seven or eight villages in the length of the Val. About one-third the way up are the mines of San Carlo, about two-thirds the mines of Pestarena, and it had almost startled me to see the English inscription in this remote spot. I believe that these last mines, after so many centuries of varied existence, have now ceased to pay, and that the company has either come to an end or is waiting a new promoter. Be that as it may, the alpine mines have fallen on bad times lately. The name Pestarena is said to be derived from the Latin *pistrina*, meaning mills. In recent times the mills for the ore amounted to about two hundred.

Pliny mentions the gold-mines of the Ictymuli, and states that a law existed forbidding their employing more than five thousand men in them. The Ictymuli are supposed to have been the original inhabitants of Piedimulera. Although there were then no mines at that place itself, some have within the last few years been opened there. Later a number of the Arian heretics, nicknamed *cani* (dogs), were sent to work in the mines by the Christian emperors. It is more than probable that some of the ancient British were sent there also. The Saracens worked the mines during their invasion, and since those days they have been carried on continuously to our own times.

The rocks in which the gold is found consist almost entirely of gneiss, so tunnelling is fairly safe. The ore consists chiefly of friable pyrites, occurring in lumps of irregular cube-shaped crystals. The gold is very rarely discoverable by the eye, as it is contained in a mixture of sulphuret of iron, quartz, arseniuret of iron, antimony, and the argentiferous sulphuret of lead called galena. When the ore has been picked and washed, it is ground up into a rough powder and mixed with quicklime in a tub. The effect of this is to convert the sulphurets into sulphates, and so to leave the way clear for the subsequent admixture of mercury. After this process is finished the mixture is put into what, for want of a better word, I must call churns, which are first nearly filled with water, and then the quicksilver is added. The whole is next churned for twenty-four hours in order to dissolve out the salts and to enable the mercury to amalgamate with the gold. When the churning has been completed and the rubbish separated, and the water poured away, the amalgam is put into chamois-leather bags, through which the mercury is squeezed, leaving the gold behind as residuum. A good deal of the mercury is lost owing to the antimony.

About two pounds worth of gold is extracted from each hundred kilogrammes of ore. On this there is a Government tax of 10 per cent. So that the gold is not very plentiful—not so plentiful as it must have been in Wales in the days of James I., when Sir Hugh Middleton realised two thousand pounds per month from the Dolgelly mines, all of which he expended on his New River scheme for supplying London with water.

The mines are not very obtrusive in appearance, and do not at all spoil the beauty of the valley. Indeed, if one had not been told of them one would hardly suspect their existence, for the mills are all down in the valley by the bed of the Anza, which supplies abundant water-power for them. Sheds cover their adits. Usually the entrance is through a trap-door giving access to a shaft about one hundred metres in depth. The galleries run from the bottom for hundreds of yards into the mountains, and are generally about six or seven feet high. There is one danger to many of them, and that is the Anza, whose water has been occasionally known to break through, particularly when the galleries run under its bed. I was told one harrowing story of the water forcing its way in this manner into the lower levels of the galleries, which farther on bent upwards above the level of the water, so that the cries of the imprisoned men could be faintly heard by their wives and children above; but it took the rescue party too great a time to bore through the rock, and it was only when the cries had been stilled in death that the poor men were reached.

When a vein has been worked out and it is desired to find a new one, a dark and stormy night is chosen, when the lightning has full play among the rocks of the Alps. Those who have had the nerve-racking experience of being on an alpine

summit in a storm, and of hearing their ice-axes 'sing' in their hands with the electricity passing along the rocks, will realise that men posted at good points of observation will be able on such a night to note the scintillations of the pyrites where a vein exists, and to mark the place. The following day they look for traces of decomposed pyrites, and if they find them a shaft is sunk.

The walls of the Val Anzasca are lined with trees, the cutting of which forms a great industry for the villagers not employed at the mines. Occasionally, as one drives along, one is startled by seeing a great tree-bole denuded of branches apparently flying through the air from the heights on the opposite side of the valley; and as it lands with a thud against a balk of timber near the roadside, placed to receive it, one sees that it has traversed the whole distance slung on a stout wire which is suspended across the valley. The journey across thus takes only a few seconds instead of hours, and the tree is carried directly to the mill to be further dealt with. When the logs are finished they are cast into the Anza, which carries them down to Piedimulera. Sometimes, where the gorge narrows, a block of these logs will occur in the mountain torrent, and the force of the stream will pile them up to a considerable height. A man is then employed to pick them off one by one with a sort of iron hook attached to a pole. It is a difficult and dangerous task, in which he has to display the greatest agility in order to avoid being crushed.

Oddly enough, Macugnaga itself is a German-speaking village, having been colonised from Switzerland at the instance of the sixteenth-century lord of the valley, who colonised Saas, on the other side of Monte Rosa, with Italians. Why, history does not say. There is a tradition that they were originally followers of Martin Luther, driven over by persecution; but this is preposterous, as they have always been devout Catholics, as also have been the inhabitants of the Valais from which they came. Near the old church there is a great lime-tree which they brought with them. Then it was only an ell long; now it is no less than twenty-six feet in circumference. In nearly all the churchyards in this valley they have a gruesome custom of digging up the skulls of the dead, and of putting them into a skull-house built to receive them; the more important ones are pigeon-holed and neatly ticketed with the names and dates of death, and the uppermost skulls of the common piles are crowned in weird fashion with the priests' old birettas. The women all wear white veils when going to church.

The valley is a paradise for the botanist, as many ferns and plants are found here which can be found nowhere else. Now that the tunnel through the Simplon has become a fact, the southern valleys of Monte Rosa, hitherto unknown to all but the mountain-climbers, may rightfully expect to attract a stream of northern visitors. Monte Rosa is nothing but a desolate mass of rocks and ice on the Swiss side, but she sits a very queen enthroned among the lovely Italian valleys which run so deeply into her southern flanks. The glories of the valley of Zermatt and the Riffel pale before the valley of the Lys and Val Anzasca. Mr Ball has said that for grandeur, beauty, and variety, the valleys of Monte Rosa were entitled to pre-eminence not only over the Swiss valleys, but over those of the whole world; and this, I think, most visitors to them will confirm.

A ROMANCE OF ORD.

CHAPTER III.

THE Laird's den was a small room on the ground floor of the house, severely plain and masculine in its appointments, but all the more interesting to Katie on that account. She was wandering idly round, taking unconscious stock of the various possessions it contained, as if in search for some fresh clue to its owner's personality, when a large panel photograph in the centre of the writing-table caught her eye, and instinctively she paused before it.

It was of a young girl in evening-dress, and the triumphant, almost disdainful, beauty of the face seemed to leap out of the dark frame to Katie's eyes with a stunning and bewildering effect. For some moments she remained standing silently in front of it, absorbed in that elementary though none the less cruel exercise of self-depreciation which only the very young know how to indulge in fully, when a voice at her elbow made her start.

'Well, what is your verdict?' inquired Ellis.

'She is beautiful, of course,' was Katie's abrupt reply, her clouded eyes still fixed upon the picture.

He agreed nonchalantly. 'And that doesn't do her justice,' he added the next moment.

'Then you have seen her lately?' said Katie.

'I have just been staying with her mother, Lady Lancaster, in London,' he replied. 'She is my aunt. Rose and I used to be playmates when she was an elf with a pigtail. Then I went abroad, and when I came back I found her metamorphosed into this;' and he pointed to the photograph. 'You will have a chance of seeing her for yourself soon,' he added a moment later. 'She and my aunt are coming up to pay me a visit next month.'

'Then you are still playmates,' blurted Katie almost before she was aware, raising her blue eyes suddenly to his face.

He gazed back at her silently for a moment, an odd smile flickering about his lips.

'Well, hardly that,' he pronounced slowly at last. 'I worship still, but from afar. You will understand what I mean when you see her,' with a little sentient laugh. 'My friend Usgood is coming to help me to entertain them.'

'So that he may occupy the mother's attention while you enjoy yourself with the daughter,' supplemented the minister, who had joined them, and was looking over Katie's shoulder at the photograph.

Ellis laughed frankly. 'You are too clever for me, sir,' he said, though without a trace of embarrassment in his tone.

The appearance of tea at this juncture provided a welcome interruption; and, in answer to a request from the Laird, Katie seated herself at the table to do the honours. She was indignant with herself for the influence she had allowed the photograph to exert upon her mood, and fearful lest her host should have remarked any change in her demeanour. 'What right had she, the daughter of a country minister, to court comparison with a girl in Miss Lancaster's position?' she asked herself angrily. Their lots were cast in very different spheres, and the sooner she realised the fact the better.

It was this determination that lent a touch of coldness and indifference to her manner when, a little later, she and the Laird made their promised inspection of the drawing-room.

Ellis, who had looked forward all the afternoon to this opportunity for a *tête-à-tête* with the girl, was nonplussed by the sudden change in her mood, and utterly at a loss to account for it. But though her coldness piqued him, it had the effect of stimulating his interest in her personality; and by the time she had pronounced judgment on the condemned room he would have welcomed any excuse to lengthen the interview.

'What do you say to a turn in the gardens?' he said, pausing at one of the French windows that stood invitingly open.

But Katie shook her head. 'I am afraid there wouldn't be time,' she retorted carelessly. 'My father spoke of starting home at six o'clock. It must be almost that now.'

'It is more,' assented Ellis gravely, pulling out his watch as he spoke. 'Shall we go back to the smoking-room, then?' he added, making a movement towards the door as she still stood hesitating.

She started forward at once, her face grown suddenly crimson. Somehow, his manner of accepting her rebuff had made her feel very small and very insignificant.

But his parting words as they drove away consoled her a little, though they were addressed pointedly to the minister. 'I am shooting over Kyllachie Moor to-morrow afternoon,' he called from the porch, whither he had accompanied his guests. 'If I am not too late, may I drop into the manse to tea?'

'By all means, if you take your chance of finding us,' called the minister heartily. 'I shall probably be out. But Katie here will look after you.'

The Laird's answer was lost in the grinding of gravel as the manse chariot started forward.

On the homeward way the minister was unusually discursive, and talked of their visit and the character of their host, with whom, notwithstanding his previous strictures, he appeared well pleased.

Katie listened silently, glad of the excuse to indulge in her own thoughts. The impulse of self-depreciation that the sight of the photograph had evoked within her still dominated her mood; and, as if to add to its bitterness, the memory of the pleasure with which she had heard Ellis's tale of her supposed likeness to the backwoodsman's wife returned upon her, making the contrast between herself and the London beauty seem almost grotesque. For the first time in her life the longing for some such inherent support as that of noble birth or great beauty assailed her, and in response to it she broke into the midst of one of her father's panegyrics with an abrupt question.

'Father, who were the Bethunes?' she demanded, raising a pair of stern, inquisitorial eyes to his face.

The minister was too gratified by this opportunity for expatiating on his favourite theme to remark the irrelevancy of the question, and launched forth at once into a sea of genealogical complexities which endured for the remainder of the homeward way.

'Ay, their blood was of the best, the Bethunes; though their morals were, to say the least of it, medieval,' he added in conclusion, as the white stacks of the manse came suddenly into view round a bend in the road. 'So be content to be the daughter of divinity, Katie'—and he half-turned towards the girl with a little whimsical laugh as he spoke—'and don't trouble your head with your ancestry.'

Strange to say, in his lonely den at Ord, Martin Ellis was following something of the same train of thought and arriving at a very similar conclusion. Though he had no knowledge of facts such as the minister's to guide him, he had wound up a long train of reflections upon the personality of his late guests with the brief but significant summary—thoroughbred; and to him the term was perhaps more comprehensive than to one accustomed to the restrictions of a narrower civilisation. In his acceptation it was an all-round verdict that included not only race and training, but heart and mind as well; and Ellis was not given to undue enthusiasms. But, whereas in the case of the father his interest was to a certain extent superficial, the daughter appealed to much deeper strata of his emotions.

Up till his accession to Ord the idea of marriage had never occupied a very prominent place in his imaginings; in fact, he had put it from him as a secondary purpose of his life, only to be indulged in if some lucky chance threw fortune in his way. But with Ord had come new responsibilities, and among them marriage of necessity had a high place. Not that he was minded to sacrifice his future happiness to any sense of duty, however imperative. He would marry to please himself, or not at all.

But having once found his ideal, the rest was inevitable. That Katie Bethune represented the nearest approach to that divinity he had yet met was already an accepted conviction in his mind. But for the further developments he was content to await events.

'I wonder what old John Usgood will say,' he murmured at last, rising out of his chair and letting his sleepy eyes wander round the small empty room that was now for him so redolent of the girl's personality. 'But I'll let him find it out for himself. He's clever enough.'

CHAPTER IV.

ELLIS'S self-invited call on the day following the luncheon at Ord was only the precursor of many such informal visitations; and as the minister's sense of duty was peculiarly exacting, and his flock a scattered one, it generally happened that Katie was alone to receive him.

The *tête-à-têtes* on the manse-lawn or in the bright, homely drawing-room became an established institution for the pair, and were often followed by long rambling excursions over the bare, wind-swept heights above Ord, where, with only the curlews and peewits for company, they would thresh out that old yet ever new and inexhaustible theme for man and maid—their own personalities.

One day they had taken refuge in a shepherd's cottage from a squall of wind and rain that had suddenly appeared from nowhere, eclipsing the sunshine of a moment before, and sending a sheet of gray rain slanting down the glen, when Ellis said abruptly, 'Well, I suppose this is the last free afternoon I shall have for some time.'

Katie, who had been leaning against the open door, opposite him, watching the storm, moved suddenly inside as he spoke, and, crossing over to the fireplace, held out her hands to the red glow of the peat-fire on the hearth. 'I suppose so,' she said at length, in a matter-of-fact tone, 'as your aunt and cousin arrive to-morrow.'

'And John Usgood to-night,' he supplemented, following lazily in her wake across the dark little kitchen, and taking up his position facing her, one shoulder propped against the high mantel. 'You have been very good to me,' he added, his gray eyes fixed intently on her downbent face under the boyish tam o' shanter.

She laughed, glancing up at him as she did so. 'What nonsense!' she exclaimed.

But his eyes remained fixed upon her. 'I feel as if the first chapter of our friendship was about to close,' he went on seriously. 'I wonder what chapter two will be like.'

Katie laughed again. 'A repetition of chapter one, I imagine,' she exclaimed.

He shook his head. 'I think not,' he said; then added with deliberate emphasis, 'I hope not.'

A silence followed his words. Katie had lowered her eyes once more and was attentively examining one of the thongs of her stout leather brogues which had come unfastened. 'Perhaps there will be no second chapter,' she said at length, throwing up her head and walking over to the tiny window, down which the rain was falling in sheets.

Ellis was about to follow her, when the abrupt entrance of the shepherd's wife interrupted him. She had been cutting bracken in the glen, and appeared, a drenched figure, in the doorway of the sheiling, her short petticoat heavy and sodden with rain, her shawl wound tightly about her head.

'Ye s'uld ha'e made yoursel's a cup o' tea,' she exclaimed in the loud, overpitched tone of one unaccustomed to the sound of her own voice, when their apologies were concluded. 'Juist wait a wee till I'm dried, and I'll luik aifter ye;' and she disappeared into the but-end of the cottage as she spoke, leaving the two alone once more.

They were standing side by side now in the centre of the kitchen, and for some seconds they remained thus, without speaking. Then slowly they turned towards each other, an expression of mute amusement growing in their eyes. With only a thin partition between them and inevitable interruption, it would be vain to attempt to reawaken the spell that had held them a moment before.

Ellis was the first to speak. 'Next Wednesday, when you come to Ord, the second chapter will commence,' he announced in a low yet confident whisper.

And Katie made no effort to contradict him, because she believed in her heart that he was a true prophet.

The fête on Wednesday had been arranged in honour of the Laird's guests, and was a mixed gathering of gentry and farmers after the patriarchal system which still holds good in some remoter districts of the Highlands. Katie and her father were late of arriving. But some clairvoyant instinct seemed to warn Ellis of their approach, and he detached himself at once from the little group of which he was the centre, and came quickly across the lawn to greet them.

The expression of his eyes as they lighted on her was welcome enough to Katie without any spoken words, and sent a thrill of exultation through her heart which even the chill response of Lady Lancaster and her daughter to the introduction which he hastened to effect failed to dissipate. Just for a second perhaps the almost dazzling beauty of the London girl and the exquisite grace and daintiness of her attire sent a pang of envy through Katie's heart. But she had forgotten it the next moment as she found herself bowing to a small, grave-faced man who was standing among the house-party, and whom Ellis had introduced with smiling significance as 'My friend Usgood.'

Something in the curious intensity of his gaze and a hint of baffled recognition in the dark, deep-set eyes as they rested on her face caused the girl

a momentary feeling of embarrassment. But the moment he spoke her shyness disappeared. There was such a true ring in his voice, and beneath the gravity of his demeanour a suggestion of lurking humour that made constraint impossible.

'Shall we find somewhere to sit down?' were his first words, glancing round the groups of gaily dressed people that covered the lawn as he spoke. 'Or do you prefer talking in a crowd?'

Katie laughingly denied the imputation, and under his guidance was soon ensconced in a shady corner of one of the conservatories, with the cool green of tropical verdure all around her.

Usgood did not talk much, but he had a knack of drawing others on to converse; and, almost without realising it, the girl was tempted from her usual reserve, and spoke freely of herself and the simple duties and pleasures that made up the sum of her existence. Now and then the look of puzzled recognition that had first struck her would steal into his eyes as he listened, and several times she caught him studying her face with curious intensity.

At last, emboldened by the friendliness of their intercourse, she challenged him to explain the mystery, giving as her apology the likeness Ellis had already discovered between her and the little woman of the prairies.

To her surprise, he seemed annoyed by the allusion, and briefly retorted that he had never known the woman in question. 'There is a likeness in you to somebody I once knew in America,' he confessed a moment later, as if ashamed of his former brusquerie, 'though I cannot place it. Have you ever had any relations out West?'

'My brother,' she retorted, and paused. 'I cannot tell you where he is,' she added in the defiant tone she always assumed when speaking of the scapegrace. 'We have lost sight of him for many years.'

'Bethune — Bethune,' repeated Usgood abstractedly.

'Diarmid Bethune,' supplemented Katie in a reflective undertone. 'We called him Jack.'

Usgood gave a violent start; his brows contracted over his dark, cavernous eyes; the colour ebbed slowly from his face. 'Diarmid!' he echoed in a low voice.

'What is it? You have met him—you know him!' cried Katie, leaning forward, her eyes seeming to scorch him with the intensity of their gaze. But at her question his self-control returned.

'Never, I am afraid,' he retorted with a slow, compassionate smile. 'I am sorry my manner should have misled you,' he continued more hurriedly. 'But the name Diarmid is connected with a rather painful episode in my past, and hearing it mentioned suddenly, when I was unprepared, took me aback. That is all, I assure you.'

Katie shuddered. 'I didn't know what to think or expect,' she murmured in a low voice. 'It is so long since we have heard, and'——

But before she could proceed further the conservatory door opened, and Ellis appeared on the threshold.

'Ah, so you are here,' he said, limping towards them. 'I have been looking for you everywhere. My cousin is going to sing, and I should like you to hear her, Miss Bethune.'

Katie rose at once, thankful for any excuse to escape from the unpleasant associations of the last few moments. Usgood followed her example, though more deliberately. To any close observer his eyes must have betrayed the strain and shock of his late emotions.

But Ellis was too much engrossed with his other guest to pay much heed to the variations of his friend's moods. 'When the song is over you must spare me a few moments,' he murmured in Katie's ear as she moved down the narrow pathway in front of him. 'I have thought of a most auspicious preface for our second chapter.'

She nodded in response, glad that their relative positions prevented him from seeing the flush that had mounted her face at his words.

A crowd had collected in the drawing-room to hear Miss Lancaster sing; but Katie and her host contented themselves with a place near the door, so that they might make an easier exit afterwards.

Usgood had disappeared. 'Gone for a smoke probably,' as Ellis explained. 'He never could stand much society at a time.'

'How beautiful your cousin is!' remarked Katie to her companion when they had reached the garden, having escaped before the encore with which Miss Lancaster's performance had been greeted.

'Yes,' replied Ellis abstractedly, 'she is.'

'And what a lovely voice!' added the girl.

He nodded acquiescence, then suddenly stopped and faced her. 'I didn't bring you out here to talk about my cousin,' he burst forth impatiently. 'And you know it.'

Katie stopped too. 'What shall we talk about, then?' she queried provokingly. 'Your friend Mr Usgood? I like him so much.'

'I knew you would,' retorted Ellis quietly.

'And isn't it strange he has discovered a likeness, too, between me and some one he has known in America?' she ran on, raising her blue eyes suddenly to her companion's face. But something she saw there checked her, and the colour ebbed slowly from her own.

'Katie!' he cried.

But before he could say another word Lady Lancaster's shrill tones came echoing down the pathway to their ears. 'Why, there he is, the truant!' she called to her daughter, who was following in her wake.

Ellis had just time to mutter, 'May I come and see you to-morrow morning?' when the intruders were upon them.

'You rude boy!' pouted Miss Lancaster, laying her white fingers possessively on his coat-sleeve and ignoring Katie's presence as successfully as if she

had been a rose-bush or some other object of floral decoration—'to run away before my encore.'

Without waiting for his excuse, Lady Lancaster turned on her heel, and, signing to Katie to accompany her, moved off in the opposite direction.

'I am going back to the house,' she said. 'You had better come with me.'

Katie agreed without demur. She was too thrilled with her own happiness to resent the unceremonious behaviour of the elder woman, and had a vague pity, besides, for the fruitless results of her diplomacy.

For some minutes they walked in silence.

'You live here all the year round, I suppose?' said Lady Lancaster at last, though without turning her head in her companion's direction.

The girl assented politely.

'It must be freezingly cold in winter,' the elder woman went on in the same tone of negative interest. 'They tell me you are sometimes snowed-up for weeks at a time.'

Katie laughed light-heartedly. 'It doesn't make much difference to us,' she said. 'We have so few neighbours in any case.'

Lady Lancaster shuddered. 'How dreadful! I shall insist on Ellis taking a house in town for the winter. It would be so bad for him to live here all the year round, with no one of his own class to associate with.'

'He has done without them for a good many years, has he not?' retorted Katie carelessly. She was gradually waking up to the rude intention underlying her companion's remarks.

Lady Lancaster cast a suspicious side-glance at her. There was none of the becoming humility in this daughter of the manse that she might reasonably have expected; and in that glance she made a startling discovery: the girl was a beauty, and of no rustic or plebeian order. There was race in the proud carriage of the head, the clear-cut aquiline features. Immediately her tone changed, a more propitiatory note appeared in her voice.

'My dear Miss Bethune,' she said, laying the tips of her fingers almost affectionately on Katie's arm as she spoke, 'you forget that he was very differently circumstanced then. Now he is a rich man, the representative of an old and distinguished name. Picture all our feelings if he were to be trapped into some low marriage; and you never know what circumstances will do for a man,' with a significant sigh.

Katie's head went a little higher, a faint colour stole into her cheeks, but her voice was calm and unmoved as ever as she replied, 'I am sure the Laird would never dream of marrying beneath him, however long he lived in these wilds.'

Again Lady Lancaster cast a sharp, inquiring glance at her. But neither insolence nor embarrassment could she detect in her expression, only a calm, unruffled dignity that somehow checked the further rudeness she was about to perpetrate.

They had reached the lawn by this time; and Katie, seeing her father in conversation with one of his parishioners, took a scant farewell of her companion, and joined him.

'The trap is round, Katie,' he said. 'I have been looking everywhere for you.'

'Then let us go,' said the girl thankfully.

'But the Laird! We can't run off without saying good-bye to our host,' replied the minister, glancing from right to left as he spoke. 'Ah, here he is,' as Ellis appeared suddenly from the direction of the garden, Miss Lancaster smiling and radiant by his side.

He came straight over towards them, leaving his cousin bereft in the centre of the lawn.

'We are off, my boy,' said the minister, shaking him heartily by the hand. 'And a pleasant afternoon we have had of it.'

Katie's farewell was taken in silence.

But Ellis's last words as he tucked the rug around her echoed in her heart all through the homeward way. 'Till to-morrow, then,' he said, and the look with which the brief sentence was accompanied filled her with joyous anticipation.

(To be continued.)

NAPOLEON'S FIRST LIBRARY.

READING was the lifelong hobby of Napoleon's leisure. In the bare room of the penniless artillery sub-lieutenant at Valence, the book-box, his brother Joseph asserted, was larger than the trunk which sufficed for Napoleon's scanty wardrobe. In Paris, before Brumaire brought him forward to the first rank, he spent his time principally in the Bibliothèque Nationale. A veritable library accompanied him to Egypt; and once definitely settled in France as First Consul, he selects, in the Malmaison, the quietest and most pleasant room for his first library. Separated by a long 'Council Chamber' from Josephine's brilliant and noisy reception-rooms, it looked out on three sides on to the quiet, leafy garden. A door opened on a miniature bridge across the moat. On this bridge an awning was fitted up, and a small table and chair placed. Thus on summer days the Consul worked in the open air within easy reach of his works of reference. These were some five thousand in number, history and philosophy predominating. French authors were naturally most numerous. The classics figured as French translations, for the most Roman of modern emperors—like the author of *Julius Cæsar* and *Coriolanus*—had 'small Latin and less Greek' scholarship. Shakespeare, by the way, figured on

the Malmaison shelves with Pope and, of course, *Ossian*, Napoleon's lifelong favourite. Among other English authors, the novels of Fielding and Richardson were keenly appreciated by the Emperor; and Milton and Hume he also studied.

Restored, after long years of neglect, the Malmaison is now a public museum, and the first and most personal of Napoleon's libraries open to the inspection of the Parisian tourist. The ceiling is adorned with medallions of the First Consul's favourite authors in the pseudo-classical style of the epoch, when 'Art stopped short at the cultivated court of the Empress Josephine.' The plain elbow-chair still bears the gashes made by Napoleon's penknife; the writing-table is ample and simple. Close by is a curious piece of furniture, on the child's money-box system, into which private papers could be introduced rapidly, but could only be extracted by the use of lock and key. On the table are a few odd volumes in the 'Malmaison binding.' The initials P. B. interlaced speak of the part Pauline, the First Consul's favourite sister, took in forming this collection. Here Napoleon worked his way to an imperial throne; hither he fled, his throne finally lost, after Waterloo; hence he wrote to his librarian at Paris to draw up a list of books, and 'especially on America,' to accompany him to the United States. But he lingered too long in his library. 'I don't understand the Emperor,' exclaimed Queen Hortense as she restlessly wandered in and out of his presence. 'Instead of deciding one thing about his departure, there he sits novel-reading.' Reading light literature was Napoleon's relief in moments of mental overstrain. On board the *Bellerophon* he 'dozes over *Ossian*.' At St Helena he reads perpetually to forget his captivity. Some twenty books from the Malmaison accompanied him to St Helena. The bulk of the remainder were sold by auction a few years after the Emperor's death.

A JAPANESE EPISODE.

By E. HALLAM MOORHOUSE.

ON a certain summer morning of 1902, the year of the King's coronation, a smart steam-pinnace was hissing her rapid way through the crowded waters of Portsmouth harbour—darting aside to avoid the lumbering Gosport ferry-boat, slipping between an anchored yacht and a destroyer coming down harbour, all with the speed and swiftness of a skimming swallow. The coxswain, standing with immovable face at the little wheel, looked straight ahead with the impassive stare which is correct in the presence of gold lace and the executive curl. He appeared to see nothing, but in reality was taking stock of every craft in the harbour. The sun glinted back dazzlingly from the terribly polished brass funnels of the pinnace, and danced so gaily over the tips of the little waves created by the fresh breeze that a dark-haired girl sitting in the stern with Captain Richard Waring and his wife laughed from sheer joyousness and the exhilaration of swift movement.

'Look, Uncle Richard!' she cried, pointing down the harbour to where the old *Victory* lay, her yellow masts shining in the sunshine, her massive three-decked hull showing all its dignity in contrast to the low, dark shape of the passing destroyer. 'Look how pretty it is! You see it so often that you don't notice; but really it's splendid—enough to make any one want to be English and a sailor!'

'Wouldn't a Japanese sailor do as well, Betty?' asked Captain Waring with a quizzical little smile.

'Well, hardly. You can't quite compare Trafalgar and the Yalu, can you? But, all the same, I know they'll do something when they meet a stronger enemy than the Chinese. What do you think Lieutenant Fukishima was telling me at the Admiral's yesterday? Why, here we are!'

She broke off suddenly and stood up as the pinnace, with a turn of the stolid coxswain's wrist, sheered neatly under the stern of a large black-and-white torpedo-destroyer flying the Japanese flag. Half-a-score Japanese blue-jackets ran to the rail and looked down at the pinnace, with flashes of white teeth and quick gestures expressive of pleasure.

'Now, auntie,' said Betty, with a gay little girlish laugh, 'we've got to go up that ladder, and it's got no handrail—nothing but a rope to haul ourselves up with! Shall I go first?'

'I should much prefer that you did,' said Mrs Waring, smiling at the girl's happy face.

Betty gathered up her skirts in her left hand, seized the dangling rope with her right, and after a moment's scramble stood on the deck of the destroyer, shaking hands with Lieutenant Fukishima, a thick-set little Japanese with an ugly jaw and high cheek-bones, the Mongolian bluntness of his face only redeemed from the grotesque to English eyes by its look of strength and a singularly attractive smile.

Captain Waring was preparing to assist his wife up the destroyer's side, and said as he glanced at the group above, 'Pity I've not my camera; it would make a capital little snapshot of the Anglo-Japanese alliance.'

Lieutenant Fukishima was extremely pleased to see his English friends, and delighted to have the opportunity of showing them the *Nagato*—his first command. Two years before he had come to England from the Japanese Naval College at Yetajima to learn the language and go through a special torpedo course. He was shortly returning to Japan

with the *Nagato*—the newest, and in his opinion the most powerful and perfect, destroyer ever added to the Mikado's navy.

'Yes, sir, she is of a great beauty,' he said in answer to some professional comment of Captain Waring, 'fresh from the yard of Thorneycroft; and she has a good speed—we have tested her.'

'You think to test her more seriously soon, perhaps?'

A quickly suppressed gleam lightened Lieutenant Fukishima's face, but he answered quietly, 'We are ready when our Emperor inquire of us; we shall not have too great fear when we hear the thunder-clap of war-guns.'

'If I were Japanese I know I should want to fight Russia,' said Miss Waring straightforwardly.

'Tut, tut, Betty, who said Russia?' Captain Waring smiled at his niece, and then turned to the lieutenant: 'However, since the name's out, you must remember that Russia's a very big country, and Japan a little one.'

'We remember—oh yes. When we in Japan are, we look across the Inland Sea to the great mainland stretching away through Manchuria to Russia, which spread herself upon the earth to crush it. But we believe not always in bigness in Japan,' he broke off as though unwilling to say more.

Later on, when he was explaining the working of the torpedo-tubes and the power of the Whitehead to Betty, something in the suppressed but keen joy with which he gave her details of explosive power and range of action struck the girl.

'You believe in this?' she said, laying a hand on the torpedo-tube.

'We all do in the destroyers, Miss Waring. In war it will redress of the balance—one of those little silver fish driven home, and there is no more a battleship!'

'A Russian battleship?' queried the undiplomatic Betty.

'A Russian battleship—yes! Since that Port Arthur was deprived from us we have not forgot. And it is the life of our country that Russia would take in her paw.'

'I'm awfully glad that England will be behind you if you have to fight,' cried Betty warmly, for she felt, under the awkward words of this Japanese lieutenant, in his badly fitting uniform, something that set her pulses tingling.

'Thank you much. We very proud to be allies of this great country; and your navy it is very fine—China, Pacific, Mediterranean, everywhere it is!'

But as Betty looked along the crowded, narrow deck of the destroyer, with its four squat funnels, its ventilators and machine-guns, she felt that it was not always great ships that conquered—that there was a spirit which outweighed tonnage. Looking at the Japanese blue-jackets and their lieutenant, she remembered how he had told her at the Port Admiral's luncheon-party the day before that when the Japanese soldiers joined the colours in war-time they called themselves *Kesshitai* ('Determined to die').

As they were leaving the *Nagato* an impulse seized her. She stood up in the stern of the retreating pinnace and kissed her hand in salute to the crimson-and-white Japanese flag stretching out in the English sunshine.

'Good luck to your flag!' she cried in her clear young voice.

Lieutenant Fukishima was standing at the rail watching his friends depart. He turned quickly to the blue-jackets also watching, and translated her words to them. Smiles broke over their faces, and a sudden strange shout of '*Banzai! Banzai!*' went ringing across the sunny waters of Portsmouth harbour.

. . . . . .

It was three years later, and the destroyer *Nagato* was no longer lying in Portsmouth harbour, but under the heights of Tsu-shima awaiting the night and the admiral's word. All that long afternoon the battle had rolled and raged across the waters of the Sea of Japan. Early in the morning Lieutenant Fukishima had been one of the first to get sight of the Russian fleet, so long awaited, looming up solemn and threatening through the mist and spin-drift that blinded his staring eyes. He clung to the rail of his destroyer as she plunged in the heavy swell with a grip that nearly burst the skin across his knuckles, and felt his heart expand with steady exultation; it was no wild flame that leaped up in his Samurai spirit, trained through long generations of self-control, but he knew with an instinct deeper than knowledge that the great day of his life had come—the day in which all his years of preparation were to be tested on the touchstone of experience. He and the *Nagato* had sought this day through many dangers round Port Arthur, but had so far failed to find it, though they had both been in close touch with annihilation. In the course of those weeks in the icy seas round the besieged Russian fortress, Fukishima had learned to know his crew and his ship with a stark intimacy; and day by day, with unswerving faithfulness, he saw to it that every nail and bolt and piston-rod, every torpedo-tube and quick-firer, in the *Nagato* was ready—ready for the chance he meant to wrest from the very jaws of death.

For hours the Japanese guns had thundered with such an unceasing roar that twenty miles away the houses were so shaken that people feared an earthquake. It seemed impossible through the smoke and fury of battle to believe that silence had ever rested over that heaving sea. The swell was so heavy that destroyers and torpedo-boats were ordered to the shelter of Tsu-shima and Takeshiki, and there Lieutenant Fukishima waited till nightfall, his swarthy face impassive in outward aspect, his spirit contained. Like the rest of the Japanese navy, he had supreme faith in the quiet, gray-haired man who walked the quarterdeck of the *Mikado*, and never doubted that 'Father Togo' would make use

of his torpedo craft when the sea abated and the right time came.

Twilight fell upon the stricken mob that had been the Russian fleet. Some of the morning's battleships had been sunk, three of the cruisers were in desperate flight to the southwards, and the shattered remainder were trying to form some sort of order out of the deadly havoc, when through the dark from ship to ship sped the cry, 'Torpedo attack!'

There was a wild spluttering from the few Russian quick-fire guns that were workable, and suddenly the night was split into ribbons of stark light as the remaining searchlights of the shattered fleet were switched on, wildly searching the dark waters for those low, speeding shapes that meant utter destruction to the shattered Russians.

The thin plated decks of the *Nagato* throbbed with the beat of her engines as she sped onwards to the foe. Luckily the sea had moderated towards night, but the torn water seethed round the destroyer's sides and was drawn up clinging to her stern in a roaring cataract of foam. The long wake gleamed ghostly behind her, and now and again a red glare burst from the smoke-stacks, hinting at the pressure down below. Tarro Fukishima had left the bridge as the distance from the enemy lessened, and now was crouching by the forward torpedo-tube, something resembling the rigidity of a carven idol in his attitude and the look of his set face.

Through the darkness loomed a deeper blackness, which was a Russian battleship, and on that his straining gaze was fixed. Suddenly the blinding shaft of a searchlight cut across his eyes like a sword, and the *Nagato* stood out upon the night stripped of the protecting dark. The Russian flashed into points of flame, and the clash and rattle of her guns came shouting down the wind. But in another instant, by a turn of the quartermaster's wheel, the destroyer had plunged into the deeper darkness on the edge of the searchlight's sharp rays —plunged and sped onwards till the distance narrowed from four hundred to two hundred and fifty yards. The signal had been, 'Give finishing-stroke,' and the *Nagato* was going in to do it. Fukishima's hands had never left the keys of the torpedo-tube through those blinding moments in the glare of the Russian searchlight, which now was wildly sweeping the sea in search of the *Nagato;* and though he had felt a sudden sharp stab in the thigh, his only thought was an instant thankfulness that his arms and hands were untouched. Another moment, and with a quick turn of the levers the torpedo was loosed and sped towards the looming battleship, true on her course and so close to the prey that she could not fail. The Japanese lieutenant turned to go to the little forward bridge, and found he could not raise himself; one leg was useless, and a thin dark stream ran wavering down the shaking deck. Fukishima looked at the blood he had shed for his country and smiled with a strange flash of white teeth. He pulled himself on his knees to the rail, and half-raised himself by it, straining his eyes towards the Russian battleship. Through the random firing all about him his trained ear had caught a muffled knocking stroke—the veritable hand of death knocking at the warship's side—and suddenly a column of water dashed on board, and the Russian man-of-war heaved up her great forecastle and went down by the stern as though she had been clutched from beneath and drawn down to the ocean-bed.

Fukishima's face was transformed; fierce elementary things broke up its Mongolian impassivity; the blood of all his fighting ancestors rose surging within him as he pulled himself up and shouted the full-throated war-cry of old Japan: '*Banzai! Banzai!*'

That triumphant shout was cut in half by the sweeping shaft of another battleship's searchlight which had found the *Nagato*. Quick on the heels of the light came a bullet striking Lieutenant Fukishima full in the chest. Thus death found him in that bright light, his duty to his country and his ancestors fully done, his blow struck home. In the last moments of his life he saw that a large rent was torn in the white-and-crimson of the *Nagato's* flag fluttering in the breeze. And suddenly, by some trick of memory, there flashed before his inward eye a vision, a momentary picture, of a blue shimmering sea and a dark-haired English girl standing up in the stern of a retreating pinnace and kissing her hand to the Japanese flag. 'Good luck to your flag!' she had cried across the waters of Portsmouth harbour—the same flag that fluttered its gaping rents in this murky atmosphere of death. The memory flashed by in an instant, and a great darkness and silence crept down upon Tarro Fukishima as he dropped upon the slippery deck of the *Nagato* with one last faint, indomitable whisper of '*Banzai!*'

WINTER.

The dream-like lap of the waters
Is gone from the shelving shore,
And the thunder of breaking billows
Fills the shuddering air once more.

The law stands ever steadfast,
'Neath sun and moon and star,
That rest is the root of action,
And peace is the fruit of war.

The summer and the winter
Are the golden and silvern waves
Of the rolling sea of the seasons,
Which our little life-rock laves.

And through the crash and the tumult,
And amid the storm and strife,
The billows are bearing us onward
To the goal of a grander life.

OLD AND NEW CAIRO.

By GEORGE PIGNATORRE.

AIRO—or Masr-el-Kâhira, as the Arabs call the great city of the Fatimite califs—has retained much of its Oriental picturesqueness intact, in spite of Western innovations. Unlike Alexandria in this respect—which has gradually become a very commonplace, European-built city, with a dingy native quarter attached—is the great city on the Nile, with its splendid mosques, its typical Eastern bazaar (which the shade of Haroun-al-Raschid might revisit with equanimity and find the surroundings little changed since the days when Islam ruled more than a third of the known world), its camels and asses, and its wondrous sapphire sky.

The European quarter, with its regular, broad streets branching off in all directions from the Esbekieh Gardens, bordered by lofty ailantos or acacias, forms but a fraction of the city, and a very desirable fraction, too; but it does not impair the unmistakable Eastern stamp of the whole; nay, it adds the charm of contrast. Certainly Cairo offers all those pictures of Oriental life and gorgeous colouring we are wont to associate with Eastern cities, together with something more which we are not so apt to connect with these: the comforts and luxuries of modern civilisation. You may be charmed with the picturesque, but you may be averse to dirt however hallowed by time—unless, of course, you happen to be an antiquary without any sense of smell to speak of; and you are not obliged to put up with uncleanliness, however venerable, for the sake of the mosques and monuments.

Cairo has, besides, the singular advantage of being in touch with a long-buried past, wholly disconnected with its existence. The huge ancient creations of a remote period—the hugest and most ancient erections of civilised man still extant in their entirety—the three great Pyramids and the Sphinx, loom over what is in comparison a brand-new city, born some four thousand years at least after their erection. No intermediate links connect these gigantic structures with Saracenic Cairo; they stand, wholly apart in their solemn majesty, equally remote from Saracen or Frank, from the mailed crusaders of King Louis and the red-coated soldiers of Lord Wolseley, for a few centuries hardly count in the æons which they have witnessed. We may pass, then, through the ages, from the nineteenth and twentieth centuries to the Hegira, or to the ninth, when califs ruled, and thence to the dim, far-off times of Chepen and Cheops, when Greece was unborn, when even Nineveh and Babylon were yet unbuilt. The neat, soberly dressed European, the Arab, and even the wild Ishmaelite of the desert may be viewed in succession within a radius of a few miles.

But the heart of Cairo, the stamp on the city as a whole, is neither Egyptian nor European, but Saracenic; and the famous bazaar leading out of the Muski is an ideal Eastern bazaar, worthy of the eighth century rather than of the nineteenth. You may still alight, if you are fortunate, on personages who seem to have stepped out of the scenes of the *Arabian Nights;* you may meet the veiled lady, with her attendants, making purchases of trinkets or silk stuffs, and enjoying the chaffering which enables her to while away an additional hour or two, which is so much gained and abstracted from the total of monotonous harem-life. But more interesting even than the veiled beauty is the native merchant, for with him you may come into close touch, and converse and do business with him. He is usually a most dignified, solemn, courteous old Arab, with a long, flowing white beard, two piercing, coal-black eyes, and apparelled in the garb his forefathers have worn for centuries, such as the merchants under Saladin might have worn unaltered. Sitting cross-legged on a carpet or matting, this fac-simile of the old patriarchs welcomes your advent with a profound obeisance, and declares that all he possesses is at your lordship's disposal—for a consideration of course, as the miser said in *Nigel*—and orders coffee and cigarettes, or a narghile even, should the customer promise fairly. You may now settle down to business and make

[*All Rights Reserved.*]

your offer; after hearing the old patriarch's demand you may safely offer a quarter, perhaps less, working up gradually to a third, when the vendor will probably meet you; and should you be lucky and tactful you will be able to close the bargain before lunch. Otherwise, if you take too much time to climb up, or your opponent too much time in climbing down, to the golden mean, you will have to adjourn the sitting till the morrow. The old man may be, and often is, a swindling old cheat—anyhow, an old humbug; but he is also a characteristic figure, and forms a very original picture in a quaint setting well worth the loss of a few hours, in a country where time is not, and never has been, money. Moreover, if you are disinclined to buy at the price asked, or at any price, having gone into the bazaar out of sheer curiosity, you may leave with a clear conscience in either case, and as quietly as you entered. For the merchant is too much of a gentleman—in manners at least, whatever he be in morality—to grudge his wasted coffee and cigarettes, or the time spent abortively; which are, moreover, articles of very little account, the last especially so. In any case it was written—*Allah* or *kismet* (God or Fate) had willed it so—that the gold of the Frank should not be transferred into Mohammed's coffers. But God is great, and might send him another purchaser on the morrow.

Next to the labyrinth of covered ways, with their stalls and grave-looking vendors of wares—in interest at least—come the mosques, with or without dancing dervishes—I prefer them without—into which unbelievers are allowed to enter barefoot, or rather symbolically so—that is, with slippered feet; the difference between slippers and shoes being quite as sensible as that between fish and caviare in the Eastern Church, which prohibits the former and allows the latter during Lent.

The Moslem prays with the same earnestness with which he chaffers, and between the two he is pretty well occupied, though hardly progressive; but at any rate he gives his whole heart to both. He was wont once to put his whole heart to many other things—to learning, to poetry, to music, and to science; but that was before the coming of the Turks in the East, the Inquisition and barbarous Berbers in the West. The Arabs or Moors of to-day are as different from their brilliant ancestors of Bagdad and Cordova as the Greeks of the seventeenth century from their forebears of the fifth century before Christ. They are savage and fierce in Morocco, docile and quiet in Egypt (except when carried away by an occasional fanatical outburst like that of 1882); but they are all equally ignorant and unprogressive. The Cairenes, like all their countrymen, and like most Orientals, are usually inert, submissive, servile even, to those whom fortune favours, insolent or faithless to those whom fortune deserts; good-natured and fairly courageous in battle when led by men they can trust, but utterly worthless when officered by men of their own race exclusively or by Europeans whom they have not had time or the occasion to appreciate.

But the fellahin or native Egyptians are not the only, though they are the predominant, element in the somewhat mixed native population. There is a fair sprinkling of thick-lipped, black negroes, of straight-featured Nubians, of fair-skinned Berbers; finally, of Turks and Copts—these last being the survivals of the ancient Egyptian race who embraced a form of Christianity under the Roman sway, and preserved their faith throughout all the stress of foreign invasion. All these indigenous or quasi-indigenous races differ so strikingly in form, face, and dress that there is no mistaking them. To these must be added the Syrians and Armenians, and the various Europeans—Greeks, Italians, English, French, &c., in the order mentioned—to complete the tale of nationalities and creeds. Under the *de facto* rule or overlordship of Great Britain, all natives enjoy equal laws and even justice: benefits which had been denied them from time immemorial. Foreign tyrants and home oppressors had worked their will on Egypt under calif, mameluke, and viceroy; and though two of the latter introduced many material improvements, they never endeavoured to raise the moral standard or to better the conditions of the peasantry, who continued to be ground down by petty local tyrants, who were in their turn victimised by greater ones, who were preyed upon to a certain degree by the Khedive or the Viceroy, who was the apex of the pyramid of misrule. The only discontented classes are the smugglers and keepers of gambling-houses, who prospered exceedingly under the old régime. The greater order and efficiency of the public service have put an end to systematic smuggling; while the gambling establishments have, I believe, been closed or placed under police supervision. Public security, too, has followed the British flag. So that the Cairo of to-day bids fair to be on all counts the most pleasant winter resort for Europeans. The climate is healthy all the year round, but of course intolerably hot during the long summer for Northerners. The proper season for visiting El Masr commences in November and ends in April, during which it is an ideal residence, with its soft, balmy winds, ever-azure sky, shady walks and gardens. The perfect stillness and warmth of the atmosphere enables even the relatively weak to make excursions on donkey-back in the old-fashioned way, or, if they prefer it, in tram-cars in the new-fashioned style. You can drive to the Great Pyramid, and climb it too, without risking sunstroke or a headache, or to Sakkarah, the site of Memphis, where still older monuments await you on the spot on which the first king of Upper and Lower Egypt erected his capital, according to some, over five thousand years before the Nativity; although recent discoveries reveal the existence of a pre-Memphite kingdom. Indeed, the bourn of Egyptian history seems to recede more and more with fresh discoveries into the infinite past, as the

limits of our visible stellar universe recede farther and farther into boundless space with every fresh revelation of the telescope and spectroscope.

I have said that the climate is healthy throughout the year, and so it is; but it does not follow that it is equally pleasant. With April the season practically closes; the hot, parching *hamsin* wind blows intermittently during about fifty days (whence its name *hamsin*—from *hamsa*, fifty); but for five months the foreign visitor will find what he will vainly seek at Cannes, or the famed Riviera, or Nice, or anywhere in Europe—a perpetual halcyon temperature and almost always cloudless skies. Social relations, too, are for various reasons more cordial than they are wont to be in purely fashionable or health resorts, where people go merely for pleasure or health; and society itself during the height of the season attains a higher level in Cairo than in Nice from the fact of its not being the rendezvous solely of invalids or jaded men and women of the world, but likewise of men of science and learning, and of many who, without being scholars or antiquaries, are people of intelligence and education, who have come to visit this marvellous land and to improve their minds.

A PAWN IN THE GAME.

CHAPTER X.—DAYS OF PEACE.

NOW for John—the 'Jean' was dropped with the rags he cast off in his uncle's bathroom on the night he had reached London—followed a long stretch of peaceful days—days that, after the humiliations and haunting disquiets of madame's house, had the airs of Paradise. The fear that had closed around him so long like an atmosphere faded into a vague memory. He was put under a good private tutor for a while, and later sent to a public school. The green of country lanes lay about him instead of the stony slums of Paris. He exchanged the foul airs of the great city on the Seine for the blowing winds of English downs, the Rat and his predatory band for the comradeship of English schoolboys.

Amongst his new comrades he was at first anything but popular. He seemed, to careless eyes, slow-witted. He had an unhurrying and loitering coolness which his teachers called obstinacy. His school companions, like his teachers, looked at him with doubtful eyes. His French experiences hung round him like a mystery; and English schoolboys do not like mysteries. The English boy of that day, it may be added, had a special dislike for mysteries with a French flavour. It was only the circumstance that Jack Lawrence's fighting gifts were beyond suspicion, and were of the true British type, which saved him from being permanently branded as 'Froggie' and sent to Coventry as guilty of being more than half French.

There was certainly a strain of something uncanny about the lad. He had not lived so long under the shadow of M. Duclos and on the edge of a revolution without some mark being left on him. His French experiences had aged him. The clear, deep-set eyes seemed curiously watchful, as though they were constantly on guard against hidden but haunting peril. A gravity, not to say a sadness, in odd discord with his youth lay on the thin face.

Sometimes, however, when in congenial company, or when seduced into a game that interested him, his apparent slow-wittedness fell from him like a mask, his face lit up, he became alert and resourceful. A compelling energy of will awoke in him that gave him an easy leadership over his comrades. And if he was careless over his lessons, he had a keen interest in other things. He knew every path and stream, bird-haunted pool or nested hedge, for miles around. No persuasion could make him a student; but he read with greedy appetite, and absorbed more knowledge than could be compressed within the narrow limits of examination-papers. He had a gift for languages, and he knew French with an intimacy and a command of the *argot* of Parisian gamins which astonished his French master. But acquirements of this sort do not lead to a profession, and Robert Lawrence admitted with a sigh that to send the young fellow to Oxford would be a waste of time and money.

Paris grew dim to the lad. Echoes of great events filling the world with their tumult reached even as far as his school, but they seemed to him remote. All the figures in the sordid drama of his Parisian experiences grew indistinct. The Rat, Toulan, the goggle-eyes of Lepitre, even the dark face of M. Duclos began to fade.

Of all his Paris memories, only one survived with unfading clearness. It was the face of Denise! And always it was the Denise of the midnight visit: a girlish figure, candle in hand, with shawl-hooded face, who unlocked the room in madame's house and saved him from the Châtelet. As he lay in his bed in the darkness, with his schoolmates asleep about him, he could see at will, painted on the dark as on some black canvas, the white brow, the shining eyes, and the smile such as he had never seen on any other human lips, sad with the grief of parting and sweet with innocent love.

Meanwhile, an event occurred which completely changed the young fellow's prospects.

Robert Lawrence was sitting in his dingy chambers one foggy October afternoon, bending with frowning brows over a long and tangled brief, when his clerk entered with a card in his hand.

'A gentleman to see you, sir.'

The lawyer looked at the card offered him with a gesture of impatience.

'Dr Graham! I can't see a client except through a solicitor.'

Then he repeated the name meditatively. It stirred some dim memories in his brain, out of which presently emerged a vision of the little room in the British Embassy at Paris, the open safe, his brother's will.

'This must be the doctor,' he reflected, 'who witnessed John's will. He may help to solve the puzzle of it.—Show him in,' he said briefly.

Dr Graham's face was brown with Eastern suns, and the shrewd Scottish eyes above the high cheek-bones had a troubled and half-ashamed look as they met the lawyer's gaze.

'I am in a strange puzzle,' he said, going bluntly to his business, 'about your brother's will.'

'And so am I,' answered the lawyer; 'so there are two puzzled men. It was a bad will,' he went on with emphasis. 'It robbed his own son for the sake of a woman whom my brother at the very time he made that will had ceased to respect. For he had found out that she was nothing better than a political spy.'

'But the will is a fraud.'

'How do you know?' asked the startled and incredulous lawyer.

'Because I have got the true one—the one I witnessed.'

'But you gave me the one now before the court yourself. It was in an envelope endorsed by you in my brother's presence, and kept for security in the safe at the Embassy. Did you give me a false will?'—and the lawyer looked with shrewd and challenging eyes at his visitor. 'And do you come to tell me that?'

'Yes, I come to tell you that,' said Dr Graham ruefully. 'The Scotch side of my head warned me to keep quiet, for the story will prove me to be a fool and make some people suspect me to be a rogue; but I have a Scottish conscience as well as a Scottish head, and I cannot see a great fraud committed. Some strange trick was played on me in that sick-chamber—a trick that cheated my very senses.' He drew from his pocket a sheet of paper and laid it before the lawyer. 'Look,' he said; 'that is the will your brother signed, and the only one he signed.'

The body of the will was short and clearly written; the signature beneath was in trembling characters; a black smudge disfigured the margin of the sheet.

'That is the will he *ought* to have signed,' said Robert Lawrence as he read it. 'It does not rob the boy. But this is no good,' he went on. 'This is not witnessed. And how did you come to witness the other document?' There was a hard note in his voice as he asked the question.

'I witnessed *that*,' said the Scotchman doggedly, and put his finger on the paper lying on the desk.

'Nobody witnessed it. The only thing beside what claims to be the testator's signature is a smudge.'

'The smudge,' said the doctor, 'is my signature, and a safer one than I could make with a pen.'

Then Dr Graham told his story. He had gone to India, leaving his rooms in London locked up, with his books and part of his wardrobe packed safely away. He had just come back to England; and when settling in his rooms afresh, and unpacking his effects, he had found in the breast-pocket of one of his coats the document on the desk.

'Now,' he said, 'you know your brother signed only one will on that day in Paris?'

'Yes; the people on the other side agree as to that.'

'Well, *that* is the will he signed. By some fraud, some clever sleight-of-hand, I was tricked into witnessing another will. But that is the true will, and *there* is my signature.'

'The smudge?' asked Lawrence in a tone of ridicule.

'Yes, the smudge. It is the impression of my thumb. A drop of ink had fallen on the paper, and, catching it from your brother's hands as he seemed about to faint, I put my thumb on the ink-spot, and so left that impression on the paper.'

'But, if I recollect aright, there is a smudge on the will they have got too.'

'Yes; but it cannot be of *my* thumb. And show me that smudge and I will find the man who played the trick on me;' and the doctor's eyes sparkled vengefully as he spoke. 'He made me a fool, and he gave effect to a fraud. The pattern of the skin of the thumb,' Dr Graham went on to explain, 'is absolutely distinct in every case. It is Nature's cipher. She never repeats it. It cannot be imitated or altered. It is characteristic and separate in every case. You have only to look at that smudge through a magnifying-glass to see.'

He pulled out a magnifying-glass and offered it to the lawyer, who with minute care examined the smudge as though it were some Chaldaic inscription or fragment of black-letter Latin.

'It is the exact transcript of that thumb,' said the doctor, holding up his hand. 'There is no duplicate of it on any other human hand. You may take the record of a thousand thumbs; no one is the replica of the other. In India this is well known, and is admitted in the law courts.'

'Yes,' said Robert Lawrence; 'I have heard of it, and thought it only an Eastern folly.'

'Well, the West has something to learn from the East in that as in many other things. It is not a folly,' Dr Graham repeated; 'it is a scientific fact. Signatures written by the pen vary; they can be imitated. But the lines wrought into the skin are Nature's monogram; they are ineffaceable, and nobody can forge them.'

Robert Lawrence questioned the doctor shrewdly till the whole story was clear, and then sat for a

while meditating, a look of power coming into his brow as he thought. Then in legal fashion he slowly summed up the situation:

'You witnessed in different fashion two wills, and my brother signed only one.'

'And *that* is the one,' interjected the Scotch doctor.

'You were tricked. And how were you tricked?'

'I do not know, but I begin to guess. Let me see the other will and I will tell you.'

'Well, it is unprofessional, and the papers are with Lempriere, who acts for the other side. But he is a sensible fellow, and, I think, will let us see them. They have secured administration of the will in France, and have got the estate there; but here in England I have opposed the will on the boy's behalf, mainly on the ground of undue influence. I have fought for time, in the hope that something might turn up, and the state of affairs in France has helped me. One never knew what might happen there at any moment. The guillotine might cut madame's claim short. As it is, her major-domo is here in London at the present moment claiming to act on her behalf. They have spent the French property; but the English estate consists, in the main, of broad acres in the country and of London freeholds. And the courts do not look kindly on a will executed in a foreign country which displaces a man's own flesh and blood in favour of a foreigner of doubtful antecedents. Come,' he said, getting up, 'let us go and see Lempriere.'

(To be continued.)

THE COURSE OF A POST-LETTER.

By R. S. Smyth.

UCH will depend, as regards certain primary details, on where the letter is posted. It can be readily understood that in a small country post-office, where the business and the staff are restricted, and where, because of lesser requirements, the office fittings and even the appliances are different from those at the larger provincial or the metropolitan offices, the treatment of a letter posted there will vary accordingly. In describing 'the course of a letter,' therefore, I shall assume that the posting takes place in a moderate-sized town, say, of forty thousand to fifty thousand inhabitants.

The length of time a letter will remain in the receptacle into which it falls depends on circumstances. If posted shortly before the making-up of a mail or during a busy portion of the day, it will be removed immediately, it being necessary that the work of stamping and sorting should be kept up and all avoidable accumulation prevented, so that when the time for despatch has arrived there may be as little pressure as possible. The letters on being taken from the receiver are 'faced'—that is, arranged so that the addressed side will face the stamper and the postage-stamps be on the upper right-hand corner. The larger letters are separated, but are subsequently dealt with in a similar manner. This 'facing,' as will be seen, is a necessary preparation for the stamping, which is then proceeded with. In many of the larger offices there are stamping-machines; but the greater number of letters are still stamped by hand. An india-rubber pad to act as a cushion is inserted in the stamping-table, and on to it the letters are drawn one by one. The stamp receives a fresh supply of ink by being pressed on a saturated pad alternately with the stamping of each letter. Stamping on the face must be done very carefully, as not only has the postage-stamp to be obliterated, but as clear an impression as possible of the name of the office, date, &c. must appear. A competent stamper will face-stamp one hundred and forty to one hundred and fifty letters per minute; while stamping on the back, which is merely date-stamping, can be done more rapidly—up to two hundred letters per minute can be so stamped. During the processes of facing and stamping a sharp lookout is kept for insufficiently paid letters, those bearing stamps of insufficient value, and any suspected to be short-paid are placed aside and afterwards surcharged if necessary. At town receiving-offices stamping is not done. On reaching the head-office the letters from those offices and from the pillar-boxes are treated as has been described; but the stamp used for them has always a distinctive number or other indication to show that the posting did not take place at the head-office.

As regards the safety of letters posted in pillar-boxes, it may be said that while attempts by various ingenious methods to extract letters were not uncommon, such attempts are believed to occur but rarely now, and to be but seldom successful; the reason, doubtless, being that because of improvements in the internal construction it is most difficult to get a letter out of the aperture. Some years ago, before these improvements were effected, there were numerous thefts from pillar-boxes in Dublin, and they were traced to a youth who was found to have an attenuated arm with which the letters were reached. When boxes were introduced there was a fear—practically a groundless one, as experience showed—that the letters might form too great temptation for the collectors, and the then postmaster of Belfast invented and patented a pillar-box from which collections could be made without the collector having access to the letters, the act of unlocking the door closing and locking the bag into which the letters fell, which could then be opened only at the post-office. After a

trial, however, it was found unsuitable for general use.

I may here call attention to the fact that the first process—if the mere 'facing' be excepted—to which letters are subjected is that of date-stamping. It is well to remember this, as in cases of delay in transmission or delivery, when the date-stamp shows the cause to be late posting, it is sometimes urged that the delay arose from missorting before the letter was stamped, the complainant being unaware that no sorting whatever had been done previously. In like manner, the stamping of inward letters—those received from other offices—always precedes any process of sorting. Formerly letters posted late for a particular mail were stamped 'Too late,' and similarly those received by a delayed mail were stamped with a 'late mail' stamp. As there is now a time indication in the ordinary stamp the practice has been rendered unnecessary, and except in rare instances has been discontinued.

The stamping over, the letters are what is called 'primarily sorted.' Of course, on leaving the stamping-table they are all indiscriminately mixed just as they had been posted. The first thing that is necessary, therefore, is to sort them into divisions or 'lines of road,' including a local division. In a town of the size I have mentioned the number of these divisions depends much on its geographical position, which affects the circulation, and on its connection with lines of railway, especially if on the latter there are 'travelling post-offices.' To these offices large numbers of letters are sent, as will presently appear. Letters for London and foreign letters which circulate on London are always so numerous as to justify the making-up of a bag. They therefore form a division, while those for the more important metropolitan postal districts form subdivisions. There are divisions also for the larger provincial towns, for places served by a local line of railway or on a mail-car route, and so on.

The following description of the treatment of outward letters in the London office was given recently by Mr Babington Smith, secretary of the General Post-Office, in his evidence before a parliamentary committee: 'The operation of sorting consists of several successive processes—four operations. After the postage-stamps have been obliterated the letters are separated into a few large divisions representing the great lines of railway, Scotland, and Ireland, and a few of the larger towns. The correspondence for each division is then separated into sections, technically called "roads," consisting of groups of places in a particular area or of large towns and their sub-offices. This is called secondary or divisional sorting. The correspondence for each "road" is then divided into the various places comprised in the road; this is called final sorting. Then the correspondence is tied in bundles and placed in the mail-bags, which are then tied and sealed for despatch. This is the work of the despatching sorters.' The foregoing description of secondary and final sorting applies equally to provincial offices, and need not be repeated.

It will be observed that letters cannot always be despatched in direct bags from the places of posting to the delivering offices, because that would obviously involve the making up of an enormous number. The plan adopted, therefore, is to send the letters to intermediate or 'forward' offices which are known to make up bags for the respective offices of delivery. This, of course, necessitates re-sorting at the forward offices; but that process is greatly reduced by the use of 'labelled bundles' for places the letters for which, though numerous, are not sufficiently so to justify the making up of a bag. These labelled bundles are sent on by forward offices just as received.

Amongst the most important of such forward offices is the H. & K. P. O. (Holyhead and Kingston Packet Post-Office), through which the greater portion of the correspondence between England and Ireland and a good deal between Scotland and Ireland, and *vice versâ*, passes. Of course, much goes through in sealed bags and labelled bundles for the more important towns, but still an enormous volume is dealt with letter by letter. This can be readily understood when it is stated that the staff on duty averages about sixteen for each trip—of which there are two in each direction daily; but when foreign mails have to be dealt with the force is almost doubled.* As many as one hundred and fifty bags, containing from fifty thousand to sixty thousand letters, besides newspapers, are received and opened, and this necessitates the making up of about two hundred bags, while those passing through, and the labelled bundles also, often exceed that number. All this work must be done in a little over two and a half hours.

The advantages of such a 'forward' office as the H. & K. Packet are of first importance. Letters from innumerable places in each country converge there, are re-sorted, and sent direct to their respective destinations. To illustrate: ten, twenty, or thirty towns or places in England may each have some letters for a single town in Ireland, and instead of their being sent to that town in so many different bags, as they would have to be in the absence of the 'forward office' system, they are sent to the packet, and, after being sorted, all are included in the *one* bag made up there for the town in question.

It should be understood that 'forward' letters are not as a rule stamped at forward offices. This will account for the majority bearing the stamp of only two offices—those of posting and delivery. Sometimes, indeed, letters will bear only the stamp of the former, because at times of much pressure, and occasionally for other reasons, stamping at the delivering office is suspended.

On arriving at the office of delivery letters are at once stamped and sorted to the 'walks' of the post-

* The regular force for the packet duties consists of three superintendents and forty-five sorting clerks.

men to whom they are then handed. Some towns, however, are now served by a railway travelling post-office, and receive their letters already sorted for the postmen, the travelling staff having been trained in the local 'walk' sorting. This saves time, as the postmen can at once commence to arrange their letters for house-to-house delivery according to the route by which they have to proceed. It may be mentioned that in sorting for town delivery the sorter always looks first at the middle line of the address, because on it, as a rule, the name of the street will be found; but in the case of letters for despatch it is the last line that is invariably looked at first, in the expectation that it will show the place of destination. I mention this because some persons—in the belief, apparently, that the full address is read, and evidently with a desire to help the sorter—place the name of the town at the upper left-hand corner, thinking the eye will first light on it. Instead of assisting, this tends to delay.

In connection with the delivery by postmen it may be interesting to state that letters will not be placed under doors or in a window, even though this may be requested; that a letter for a servant or a person in a house other than the householder will not be placed in the letter-box against the express wish of the addressee, although the householder may desire that this should be done; that such requests as 'Not to be forwarded if absent,' 'Not to be redirected,' &c., written on letters will not be acted on; that if the address of a letter be so indefinite as to apply equally to two or more persons, when it is not known to which of them it ought to be delivered the letter will be endorsed 'Insufficient address' and treated as undeliverable; that in the case of a person unable at once to pay the charge, a charged letter will, on request, be kept for three days; that a letter that has been opened will not be taken back unless it be clearly shown that it was not intended for the person who opened it; and that, while a rural postman may deliver a letter on the road, a town postman is not permitted to do so.

As regards visitors' letters, it is very desirable that the name of the householder should always appear on the address. While its absence would be no proper excuse for a letter not being presented at the address given, it has sometimes happened that a postman, knowing the occupier of the house to be of a different name, hastily concluded that the address was incorrect, and marked the letter 'Not known.' There have also been instances in which a servant, unaware at the time of the name of the visitor, did not take the trouble to inquire, and declined to receive the letter. An objectionable practice, that of signing letters with only the Christian name or a pet name, and the giving of an incomplete address or no address, may be here referred to, as such letters cannot be returned; thus the writers in the event of non-delivery remain unaware of the fact, and attribute the silence of the addressee to some other cause. This has been the fruitful source of the severance of many friendships.

Some persons residing in towns who for private or other reasons may not wish to have a letter or letters delivered at their house consider they may have them addressed to the post-office 'till called for.' This is wrong, as the 'Poste Restante' is intended solely for the accommodation of strangers and travellers; any town resident, therefore, or a resident within a local delivery so using the post-office may be required to give his address, and the letter will be sent out with the postman.

The treatment of registered letters, which is of an exceptional nature, is outside the scope of this paper. It is known, of course, that they are specially dealt with, *every* person through whose hands one passes during transit having to give a receipt for it. The system adopted to ensure their safety is as near perfection as possible, and is strictly carried out.

Some months ago a writer in *Truth* recommended that in substitution for registration, or when inconvenient to register, a letter should be prepaid a halfpenny only—thus raising a charge for insufficient payment, and thereby making its transmission more secure. Another writer in the *Daily Mail* advocated for the same purpose entire non-payment of postage. The argument of both writers was that as in such cases a charge had to be collected on delivery, the letters were necessarily dealt with in an exceptional manner—were, in fact, 'charged on' from office to office. This, however, is only partially true, as such letters are not charged against a 'forward' office. Besides, should a postman decide to act dishonestly and keep the letter, it would only be necessary for him to pay the postage himself. Indeed, if the practice were to become general the fact of the letters being unpaid would lead to the conclusion that they had valuable contents, and as they would thus be a temptation to dishonesty their security would be lessened rather than increased. For this as well as other reasons the public would be well advised not to adopt such an objectionable plan.

With reference to delays of letters from errors in sorting, it may be remarked that a great deal of post-office work is done under pressure, the last minute for posting being always clamoured for; and no matter what influx of letters may immediately precede the time of closing for the mail, all must be properly dealt with and reach the railway station at the appointed time—trains, unless in exceptional cases, do not wait for mails. Similarly, there is always a desire to have inward letters delivered at the earliest moment. It should also be remembered that much of the work is done under conditions most unfavourable for the workers—at night, in railway trains and even on the sea (the twenty-three-knot steamer or in the case of a railway the sixty-mile-an-hour express rushing on), while the entire staff—and the travelling staff is necessarily restricted—works at high pressure and always against time.

A ROMANCE OF ORD.

CHAPTER V.

LATE that same evening, after Miss Lancaster and her mother had said good-night and retired to their own rooms, the two young men made for the Laird's sanctum to smoke and discuss the events of the afternoon.

There had been a curious suppressed excitement in Usgood's demeanour since the dispersal of the guests that had aroused Ellis's curiosity; but he was too well acquainted with his friend's peculiar temperament to make any outward comment on the circumstance. His own feelings, besides, claimed a good deal of his attention. The interrupted declaration in the garden had left him strangely restless, and the long evening of conventional intercourse with his aunt and cousin had seemed interminable in consequence. He was just in that condition of mind when a man most desires a confidant, and it would require very little encouragement on Usgood's part, he felt, to make him unburden himself.

But Usgood showed no inclination to offer him the desired opening. An extra quality of reserve seemed to hedge him round, and he took long, meditative pulls at his pipe without uttering a word, his eyes, dark and absorbed, fixed on some invisible object in front of him, his lips set and resolute. At last the silence became unbearable, and, jumping to his feet, Ellis began to pace restlessly to and fro.

As always in moments of self-forgetfulness, the slight limp that disfigured his movements became more apparent; and, stopping suddenly in his walk, he found Usgood's eyes fixed on him with an expression of unmistakable significance. There was a brief period of awkwardness, during which each tried to appear as if nothing had happened; then Ellis, taken off his guard, blurted impulsively, 'It doesn't grow any less, does it?' glancing downward at his injured limb with a little defiant laugh as he spoke.

Usgood shook his head. 'I am sorry, Martin,' he said in a low, contrite voice; 'but I was reminded rather painfully of the circumstances this afternoon, and I suppose that is what drew my attention to it.'

The laugh died on Ellis's lips. 'This afternoon!' he echoed incredulously. 'My dear old fellow, you must be dreaming,' he added the next moment.

Again Usgood shook his head. 'I wish I could believe it was a dream,' he said, and paused. 'Do you remember a girl you introduced me to—a Miss Bethune?' he went on more hurriedly as the other was about to interfere.

Ellis bit his lip. The simple mention of her name had sent the colour flying from his face and made his heart beat wildly; nevertheless, he controlled himself to reply.

'Yes, of course. By the way, she told me you had discovered a likeness between her and some one you had known in America,' he went on with well-simulated indifference. 'Do you mind telling me who it was?'

There was silence for a moment.

'It is just that that has been puzzling me,' Usgood said at last in a low voice. 'Not the likeness—I settled that at once—but whether I ought to tell you.'

Ellis laughed again, though there was a forced, unnatural sound in his merriment. 'And why not?' he exclaimed. 'I promise you to say nothing of your discovery to Miss Bethune;' and, limping back to his old chair, he seated himself carelessly on the arm of it, his hands buried in the pockets of his smoking-coat, his whole attitude expressive of calm preparedness. The light from the red lamp overhead struck full on his smooth, bronzed face and steady eyes.

As Usgood stared at him, a sudden gleam of resolution dawned in his own. He leaned forward. 'Martin, do you remember that night in Travellers' Gulch?'

Ellis nodded. 'Am I ever likely to forget it?'

'And the man you shot there?' Usgood went on in the same quick, decisive tones. 'You never saw him, because you were unconscious from your wound directly after; but I did, and'——

'Well?' The syllable rang out sharp and clear as a pistol-shot through the still room.

'He was this girl's brother,' finished Usgood, lowering his head instinctively as he spoke. A deathly silence followed the revelation.

Ellis was the first to speak. 'What are your reasons for believing this?' he said. But his voice was the voice of a broken man; all the virility and manhood had gone out of it.

Usgood drew a sharp breath, raising his eyes to the ashen, mask-like face opposite him at the same time.

'I didn't realise it till she mentioned the name Diarmid,' he said in a low, quick voice. 'Then I knew. It was tattooed across his chest. But the likeness was unmistakable in any case. You don't often see such black hair and blue eyes together.'

Ellis shook his head. 'No,' he agreed; 'you don't often see it.'

Something in the slow, lifeless accents frightened Usgood, and, rising, he crossed over and laid his hand gently on the other's shoulder. But the touch seemed to waken Ellis to new life; he started to his feet in a sudden frenzy.

'It is a lie!' he cried, turning on the other, his gray eyes blazing with passion—'a devilish fabrication! You yourself told me his name was Brown—the man I killed. I saw it on his grave,

carved on the cross—David Brown. What has Diarmid Bethune to do with David Brown?' His outburst ended in a loud, fierce shout of laughter.

Usgood waited patiently till his merriment had exhausted itself, then he spoke again.

'Who puts any faith in surnames in a mining-camp?' he questioned calmly. 'There is no good trying to argue against facts. Much better face the truth. You are innocent in any case. What you did you did in self-defence. You believed Bethune had come into your tent to rob you, or worse. His friend fired first. It was a clear case of manslaughter, any jury would have agreed.'

He paused. The curt, decisive sentences seemed to have had a tranquillising effect upon the other. Gradually the light of passion died out of his eyes, the tension of his body relaxed, and in the first helplessness of the reaction he sank down into a chair, burying his face in his hands.

Usgood remained standing beside him, patient and calm, while the clock on the mantelpiece ticked out the slow minutes.

At last Ellis raised his head. To his friend's eyes he seemed to have aged ten years in the interval.

'You told me there were papers on him,' he said in a low, monotonous voice. 'Where are they?'

Usgood shook his head. 'That friend of his, Jimmy Barnes, has them,' he said. 'He left Travellers' Gulch the next day, taking them with him. I have tried to discover his whereabouts since, but failed.'

A silence followed his words.

'Then, until we find him, we can have no actual proof of the story,' pronounced Ellis again, with careful deliberativeness.

'No written proof,' corrected Usgood. 'But, as I told you before, I am as certain of the truth as if I saw his name in black-and-white.'

Another silence.

'Yet you do not think I should be justified in telling his father and sister on the strength of a mere supposition?' Ellis went on in the same tone of suppressed though painful eagerness.

Usgood hesitated. He was baffled to discover the drift of his friend's arguments, but on that account was the less inclined to advise him blindly.

'You must decide that for yourself,' he returned—'whether it is fairer to let them go on living in uncertainty or to put a final end to their hopes.'

A pause followed his words; then, with a deep-drawn sigh, Ellis rose to his feet.

'Don't think too hardly of me, John,' he said pleadingly; 'but I am going to run away from the choice for the present. I can't give you my reasons. There is one side to the question of which you know nothing. But I want your promise that you will never under any circumstances divulge my secret to Miss Bethune or her father.'

Usgood held out his hand. 'I promise,' he said gravely.

Ellis took it in silence. For a second they remained thus; then something in his expression startled Usgood.

'Martin,' he cried, 'you don't mean'——

Ellis bowed his head. 'I love her,' he said simply.

With a groan, Usgood dropped his hand and turned away. 'God forgive me!' he muttered.

The next morning Katie was up betimes and looking out of her window to see what manner of day it promised to be. Nor did the red streaks of dawn behind the mountains discourage her. As a rule, on beholding such an ominous forecast she would have resigned herself for a wet spell; but the thought of rain on such a day as this was impossible. Was not the second chapter so rudely interrupted yesterday to recommence this morning? And almost unconsciously she had conceived the garden as the natural *mise en scène* for its development. But alas for her plans! By breakfast the early morning prophecy had been fulfilled, and a soft easterly drizzle descending from a sky of uniform gray filled the air, and rendered any thoughts of outdoor wanderings impossible. So, with a faint chill of disappointment, Katie took her work and repaired to the drawing-room, pulling up a chair to the window that she might have a better view of the long, straight drive that led from the avenue gate to the hall door. In the room beneath her father was composing his Sunday sermon, that blunt condemnatory oration with which every Sabbath he sought to stir up the hearts and consciences of his flock.

The house was very still—so still that it seemed to Katie as if, like herself, the other inmates must be waiting too for some fateful epoch in their lives.

How long her suspense had continued she could not tell, when all at once the clanging of the door-bell made her start to her feet.

No one had passed along the drive beneath her window—of that she was certain; the visitor, whoever he might be, must have come by some short-cut over the fields.

With trembling haste she made for the stairs; but as she reached the outer landing she heard the study door open and her father's heavy tread in the hall.

Then followed a long altercation with some one whose voice she did not recognise, and she was about to return disappointed to the drawing-room, when the sound of her own name made her pause.

'Katie! Katie!' called the minister with a touch of irritation in his voice she knew so well, and which was the sure result of any interruption in his work.

She ran hastily downstairs, hardly feeling her feet as she did so.

'Here's a note for you,' he said, meeting her at the foot. 'One of the Ord grooms has just brought it. He tells me the whole party of them are off to London this morning.'

But the concluding part of the sentence was lost

upon the girl. The sight of the familiar handwriting had had a paralysing effect upon her, and she was to all intents blind and deaf as she stumbled back up the stairs, the note clasped tightly in her hand.

It was some time before she could bring herself to open it, but when she did so its contents occasioned her no surprise:

'Dear Miss Bethune,' she read, 'I regret extremely that I shall be unable to fulfil my promise of calling upon you this morning, as my aunt and cousin are leaving unexpectedly for London, and I find that I am obliged to go with them.—Yours sincerely, Martin Ellis.'

So far she proceeded without flinching. Then her eyes travelled on to a postscript scrawled at the foot of the page, and with a stifled moan of anguish she let the letter fall to the ground and buried her head in her hands: 'Try to forgive me, and do not think too hardly of me.'

It was these few words, added evidently as an afterthought, that brought home to her heart the full realisation of the truth. The cold conventional sentences preceding contained no reality for her, and might have been penned by a stranger; the postscript alone lived. It was Ellis speaking to her—the Ellis of her dreams, her comrade and friend, the brave knight and hero of her girlish romance.

In that moment it was perhaps her pride that suffered most—the intolerable humiliation to which she had been subjected seemed to her quivering soul as if it must ostracise her from the society of her compeers for the rest of her life. That he should have deemed it necessary to take refuge in flight, to run away coward-like from her too sanguine expectations! Oh, it was bitter! bitter!

Why had she not refused him yesterday when he pleaded for the morning interview? Why did not some doubt of him assail her to act as a deterrent upon her judgment?

But no! How could she doubt him whom she had always looked on as the soul of honour until now? And even now it was well-nigh impossible to believe him guilty.

There must be something, some excuse for his conduct. Again she took the letter and read through its cold, conventional utterances, and again as her eyes fell on the postscript her heart sank within her: 'Try to forgive me, and do not think too hardly of me.' What more convincing proof of guilt did she require? Had he meant nothing yesterday in the garden there would have been nothing for her to forgive this morning. But he did mean something, she told herself passionately. It was love she had seen on his face when she raised her eyes suddenly to his; there had been love even in his voice as he spoke her name. It may have been only a momentary weakness, a temporary ascendency of the emotions over the judgment; and in that case, of course, he was wise to withdraw in time. After all, nothing had been said, and he had had opportunities enough; a vague hint or two of a second chapter to follow the first—that was the sole ground on which she had built her hopes. Fool—fool that she had been!

Instinctively Lady Lancaster's words in the garden recurred to her, those bitter, vindictive phrases against which she had felt so well fortified and superior. Now the laugh was on the other side.

Every moment as she sat there the train was bearing him farther and farther out of her life.

With a cry of realisation she leant forward again, the pain of her loss surging over the broken ramparts of her pride. It was in this attitude that her father found her when, some time later, he entered the room.

'The gong's gone twice, Katie,' he said. 'Why, child, whatever is the matter?' as she raised a pair of dull, heavy eyes to his face.

'It's nothing—a headache,' she faltered. 'It came on suddenly, as I was sitting here. I think, if you don't mind, I'll go and lie down for a little;' and she staggered to her feet as she spoke.

'I'll send for the doctor, Katie,' said the minister, reverting to the old threat of her childish days. But the jest evoked no answering smile on her face.

'I'll be all right presently,' she muttered, passing her hand wearily across her brow and taking a few uncertain steps towards the door.

'You've dropped your letter,' said the minister, remaining behind to pick it up.

At the mention of it her self-control returned. She half-turned to take it from him. 'The Laird just wrote to say good-bye. They are all off to London this morning,' she said in an indifferent tone.

'A mad notion,' said the minister. 'He'd better have remained at home.'

She moved over to the fireplace, her fingers absently tearing the letter as she went.

But hardly had she reached it, when the floor of the room seemed to rise and rock around her, and, clutching wildly at the nearest chair for support, she fell forward, the scattered fragments of the letter strewing the ground, a merciful darkness eclipsing her senses.

CHAPTER VI.

SUMMER had passed into autumn, and already in the darkening days and creeping chillness of twilight and dawn the promise of another winter made itself felt in the glen of Ord. On the mountains the bracken had faded from green to brown, and the dying purple of the heather seemed like a last sad reminiscence of the glory that had been. The manse-lawn was strewn thick with leaves, which day by day descended with persevering insistence, trying at once

the temper and patience of John Tod, the minister's man, till he vowed to leave them unswept pending the first autumn gale that would bring the last of them down. It came at last, a wet, driving hurricane that demolished not only the leaves but felled many a noble tree as well. The principal damage was to the woods around Ord. 'But what mattered it,' the villagers asked themselves, 'with so careless and indifferent an owner?'

For three months now the house had been shut up and deserted, and the disappointment, coming after the first hopes raised by the Laird's administration, was doubly hard to bear. It was not as if he had even the excuse of some perilous expedition to foreign parts to account for his neglect. As far as they knew, the full extent of his travels was from one Continental watering-place to another in the train of those ill-mannered, stravaiging women the Lancasters.

As to the original cause of his desertion they were at a loss to conjecture. The more optimistic of them inclined at first to the belief that some rupture with their beloved Miss Katie had driven him from his home, and this idea was encouraged by the grave illness that had taken the girl on the very day of his departure. But when her slow recovery had brought her into contact with them once again they were reluctantly forced to discard the idea. True, there was a change in her. But it was not of the kind they had anticipated. She had always been famed for her high spirits among them; now, if anything, she was brighter and gayer than before. But they missed the old contagion of her mood that had seemed to draw them out of themselves, and instead of laughing with her as they had done formerly, they caught themselves pausing to question the cause of her mirth.

The truth was that Katie was acting a part, and her very anxiety to blind others to her real feelings made the portrayal forced and unnatural.

Ever since that fatal morning on which her pride, faith, and love had been swept away from her on the bitter current of disillusionment, her one aim had been to conceal the havoc the disaster had occasioned in her life.

The effort to carry out this ambition had at first told upon her nerves. But by degrees the attempt became mechanical, and in the end cost her nothing. It was easier to laugh than to cry, she found; though, indeed, tears had never been farther from her than at this time. If only the Laird would come back to Ord and settle down again she felt that the worst of her trouble would be over. She had no dread of the consequent meeting with him. The deep waters she had been through had left her with a strangely cold, impersonal feeling towards all the relations of life, and she was confident that the sensation would endure even such a test as his return.

But still the weeks went by and no word of his coming reached Ord.

At last, when the hopes of the country-side had dwindled to zero, a piece of news as thrilling as it was unexpected put a sudden end to any further need of conjecture. Ord forest and house had been let to an American gentleman, Mr Conrad, for the season reopening on the 10th of November; and the Laird was too deeply engaged in private business to return even for a few days to put the place in order or bid farewell to his people. It was a crushing blow, and during the interval that was to elapse before the arrival of the new tenant little else was talked of in croft and shieling and even the distant shepherds' cottages. The very minister was moved to indignation, and Katie had to listen as patiently as she could to his lengthy and oft-reiterated strictures on the young man's lamentable fall from duty.

She was thankful when at last Mr Conrad's arrival put a temporary end to the flow of criticism, and the general interest was transferred from the absent misdemeanant to the personality of his unwelcome substitute.

(To be continued.)

BACK TO THE LAND.

By Lady NAPIER of Magdala.

IT is an era of catchwords. Some are pretty, many are meaningless, many mischievous.

As a combination of all three, perhaps the parrot-cry of 'Back to the land' would take the cake in so far, at least, as concerns the land best known to the writer—namely, the West Highlands of Scotland. Many a pang have the traces of little homes in far glens caused the writer, many a sad wonderment as to what became of the people. Fair glens, indeed, are many, with every natural advantage of water, peats, sunny slopes, now deserted, without a trace or sound of life save the call of the wild bird on the hill, the bleat of the blackfaced sheep. The little homes are now no more. Moss-grown heaps of masonry show where they stood, and there are the green billows of the 'lazy beds' which have lain unstirred by the *caschrom* for many a long year of storm and shine.

Where are the people who planted the rowan-trees by the side of their dwellings 'to keep away the witches'? The trees are still there, many of them; but the people are gone, never to return. The towns, the colonies, the grave, have swallowed them up; and if any of their descendants were to return, what would they do when they got there? Would they live off the land as their fathers did?

Would they be likely to submit to the conditions under which their fathers lived, simply and happily, to judge by song, tradition, hearsay? Would they be content with a diet of porridge, oatcake, potatoes, and herring, and the little string of dried fish hanging outside the houses? Would the women spin and weave webs of cloth and blankets, and knit, and make sheep's-milk cheeses, and sometimes grind the corn? Would the successor of the one-eyed shoemaker be content to-day to make shoes for the people of the glen—shoes that would never wear out, and that were carried over the shoulder by a string as often as they were worn on the feet? Would the successor of the crooked tailor sit in his black house and make up the webs the women spun and wove into clothes for the men, for a small price, and be content, to-day?

Of what kin can this pale lassie home from Glasgow, sick with disease bred of foul air, unwholesome food, and overwork, be of the handsome girl with her row of splendid teeth and thick russet hair, who drove her cow home to the croft up the long glen when the sun was low, her Gaelic song resounding through the still air, a creel of peats on her broad shoulders, her knitting in her small shapely hands? What would the girl from Glasgow do in the long glen or its like—the girl with the high-heeled shoes that melt from her feet, her beflowered and befeathered hat, her trailing dress, who at times comes home for a few weeks in the summer to the old folks still to be found here and there in the old land; the girl who soon becomes impatient to return to the town that is eating her young life out, sapping her strength, hurrying her, likely enough, to an untimely grave? Who that knows this fair land has not seen these pallid girls, with their cheap finery and their openly expressed intolerance of the 'dullness' of home in the far Highlands, their craving for excitement, for the glare of the gas-lighted shops, theatres, for what they call 'life'? So in Glasgow or some other great town they are absorbed, and in the end they never return.

The boys sitting in overheated schoolrooms, their young heads crammed with modern Board-school teaching, imbibe new views of life. Enervated and weary, they turn with distaste from the sea and the boats and the rock-fishing, erstwhile the chief joys of the lives of the youth of those parts; also from the fine game of shinty played on the hillside, for which they lack strength and energy to-day. Often their chief thought is how to procure the money to be expended in the 'shoppie' in the purchase of tobacco and cigarettes to be smoked on the hillside to the accompaniment of unwholesome talk and longings for they know not what. The shoppie not only provides tobacco and cigarettes, but many unwholesome things, such as tinned meats, salmon and lobster also tinned, and white, very white bread. In the opinion of the writer the shoppie foods are greatly the cause of the deterioration in physique and teeth decay of a once splendid race. The boys grow up pale and languid for the most part, and they too drift to the towns.

Only the old people remain on the land, and not many of them—the *cailleachs* and *bodachs*, who will ere long be gathered. Who then will remain? Who will go back to the land? Will the descendants of the thousands who went down to the sea in ships at the time of the destitution in the Highlands when the potato-crop failed, and the people emigrated in shoals to Canada and Australia, where they made new homes or died by the way? Will their descendants be likely to return to the old land and the old conditions, to the stormy climate, the hard, hard life dragged from land and sea? From the sea at one time perhaps. There is but little to be gained from the sea now when the steam-trawler works his will, in many cases undisturbed. That source of living, therefore, is cut off, and the crofter-fishermen, once such a fine race of men, will soon be as extinct as the dodo.

Bitter have been the complaints as to the depredations of the trawlers to the powers that be; representations made that might, to judge from the results achieved, have been addressed with equal profit and more pleasure to a stone wall. Evidence sifted and gathered with much care, fully verified, put into form, and presented, to be cast aside as of 'no importance.' 'Trawlers! Absurd! All the fishermen have to do is to take the number of the trawler and telegraph at once to headquarters.' Certainly so easy and so simple when the number is carefully covered up, and a hose of boiling water is directed on the boat that approaches the thief, and threats are hurled that the boat shall be swamped should it come any nearer. So very easy and simple! However, the powers that be have as much fish as they require for their own dinners, which is a most comforting thought.

Who, then, will go back to the land? Who will live under the old conditions when the glens were filled with a people prosperous and content? How could any living be made off the land by a people bred in towns—soft, poor in physique, accustomed to luxury of sorts, to cheap and plentiful amusement of sorts? How would they fight the climate, the difficulties, the modern competition and rush, the loneliness, the long, dark winters?

To return to the point: Does any one want to go back to the land? If he did, most assuredly he would not stay there long.

WHEN CONSOLS FELL TO 70.

SAT in my office a broken man. For three days I had struggled to raise money. Old friends had failed me; men I had helped in times past turned from me in my extremity. Next day was the fortnightly settlement, and I knew that it was a certainty I should be hammered. It was hard—terribly hard. If I had been alone in the world I could have borne it better. When I thought of my wife and daughters the prospect was unendurable. That they should have to give up their pleasant home at Twickenham for some wretched dwelling in a cheap suburb; that the girls, who had known nothing but luxury, should have to go out and earn the living their father could not provide for them—somehow I could not bring myself to face these things. Yet I must break the news to my wife that night. I had put off the evil moment in the vain hope that things would pull round. I knew she would not blame me, and yet I dreaded her sympathy and attempts at consolation. I could have faced it better if I had known that she would find fault with my recklessness. In my wearied, muddled brain I began to wonder whether it was necessary to buy a license before I could get a revolver. Even death seemed pleasanter to me than the prospect of breaking the news that night.

All at once my head clerk entered. He knew as well as I did that I was doomed, and, to do him justice, though he had a wife and children of his own, and my failure would wreck his little bark, yet I believe he was very sorry for me.

'A gentleman wishes to see you on urgent business, Mr Davies.'

'Tell him, Sellers, that I'm very busy, and can see no one to-day.'

He went out, and a moment later returned with a card. 'I'm sorry, sir, but he insists on seeing you. He says his business gravely concerns you. Here is his card.'

I took it and read, 'Esdras B. Quilter.' Across it was pencilled, 'Personal business with Mr Davies.'

'Quilter,' I said. 'Isn't that the Yankee who quarrelled with the Stock Exchange Committee a few years ago, and gave up his membership?'

'Yes; I think so, sir.'

'Show him in, anyway.'

Mr Esdras B. Quilter was a short, very stout man, with a face which seemed the embodiment of good humour. One would have thought him the best man in the world to do business with if it had not been for his cold eye. A man with a cold eye and a perpetual smile is the wrong man to bargain with.

He shook hands with me as cordially as if I were an old friend he had not seen for many years, and settled himself comfortably in my largest chair. Then he glanced at me shrewdly, and said, 'Reckon business is none too gay with you, Mister Davies.'

If he had sidled round the subject, or approached it less abruptly, I should probably have told him to go to the devil; but he was so straightforward and so obviously interested that I did not take offence. As it was, I answered airily, 'I don't know whether the matter interests you at all, Mr Quilter, but I shall certainly be hammered to-morrow.'

'That's the way I like to see a man take it. Guess you've been going round your friends, and they've been going back on you.' He peered at me with his shrewd eyes. 'Ah, I see that's so. No man knows it better than Esdras B. Quilter. The skunks! When I did my first bust on Wall Street thirty years ago I begged and prayed my oldest friend to lend me ten thousand dollars, and he went back on me. Never mind, sir; I caught him short on Erie Rails ten years later, and I bled him—bled him dry. Now he's in an asylum at Albany. But this isn't business. What do you want to pull you through?'

His voice was kindly, even if his question was impertinent. I had had too many snubs and slights from men I knew during the past few days not to value kindness from a stranger.

'Seventeen thousand pounds,' I answered shortly.

'Eighty-five thousand dollars! H'm, that's nothing. Why, I've bust three times in my life, and never under a cool million dollars. You Britishers don't know what big business is. Well, I'll settle this little affair for you. When we've had our talk out just come with me and see my bankers. No; it mustn't be known in financial circles that I'm backing you. No; I'll take you to my solicitor's. I'll settle it with him, and he shall give you his cheque for a hundred thousand dollars to set you on your legs.'

I was dumfounded at his benevolence. For a moment I could not speak. Then, when my voice would allow me, I said, 'Mr Quilter, I am infinitely indebted to you, but I must be honest with a man who makes me such a noble offer. One thing I must say: there is no likelihood, at anyrate for some years, of my being able to repay this money.'

He waved his hand impatiently. 'Who talked about repaying? You'll earn those dollars before I'm done with you. Look here; I'll tell you why I'm doing this. Esdras B. Quilter is not famous for benevolence—that is, in business—though if you saw the Quilter University at Wabash you'd see he could beat any oil king at the benevolence-game; but sometimes he risks a few dollars on a man. Now, I've a reason for speculating on you. First, you've a good name as a straight man in the City. Secondly, you once said a good word for me when I was at loggerheads with the big bugs on your Stock Exchange Committee. It was at the Stock Exchange bar. You didn't know me, and you were talking to a skunk who didn't know me, whilst I was standing at your elbow. The skunk was running down Esdras B. Quilter, and you said your Stock Exchange

Committee should have made allowances for the difference between English and American ways of doing business. I never forget a good word—perhaps I haven't heard many in my time—so, while I've got my knife into every other member of your blamed Stock Exchange, I remember Austin Davies.'

His beaming face was all friendliness, yet I felt there was something behind this unaccountable munificence.

'Mr Quilter,' I said, 'I'm very grateful to you for saving me from ruin; but I should like to know what you want me to do.'

'You're 'cute for a Britisher. Waal, there is something behind. I had another motive back of my mind. I want a straight man who will work for me on your Stock Exchange—a man who can obey orders, a man who can hold his tongue.'

'Right, Mr Quilter; I'm your man.' I paused for a moment, wondering how I could put my thought without hurting my benefactor's feelings, 'Providing, of course, that the business is'——

He took the words out of my mouth, 'Providing that it's honest. Oh, it'll be honest enough. You're not the man I should have chosen for a queer deal. No; you will simply have to buy and sell stock when I tell you. You'll have ample funds placed at your disposal in case I'm across the pond. It'll be the straightest kind of business. You can do it all in white kid gloves.'

'Then I promise you that you will have an absolutely faithful and devoted agent here.'

'But no man must know that I'm at the back of you. Can that clerk of yours be trusted? He'll guess that I yanked you out of this hole.'

'He would have been ruined if I had gone under. He'll be as grateful to you as I am myself.'

'Call him in, then, and I'll let him know.'

I rang my bell, and Sellers came at once.

Mr Quilter looked him up and down. 'See here, young man. Mr Davies did me a good turn years ago, and I'm helping him to pull round. But I don't want every derned galoot in this city to come smelling round after my dollars when he's in a hole. Can you keep your tongue from wagging about it?'

My clerk stepped across the room and shook hands with me. 'I congratulate you, sir,' he said. 'I've been thinking about you all day, for though it would be bad enough for me, it would have been ten times worse for you if the smash had come.' Then, turning to Mr Quilter, he proceeded: 'I should like to shake hands with you, sir, for you've done me a good turn to-day. You can rely on my secrecy, though I should like to tell every one on 'Change what a good sort you are.'

'Then that's all right,' said the Yankee speculator. 'Come along with me, Mr Davies, and we'll see my lawyer. The sooner this little business is settled I reckon the better you'll be pleased.'

After Mr Quilter had had a five minutes' interview with his solicitor, the latter gentleman handed me a cheque for twenty thousand pounds.

'Get along; pay it into your account,' said Mr Quilter. 'Some of your miserable friends will have a nice shock to-morrow. Now, I've not much more to say to you. I'll send you a copy of my private telegraphic code to-morrow. Later you'll get instructions from New York. You'll follow them word for word. When the time comes for action my lawyer will be instructed to place funds at your disposal. You won't need them; but the fact that they are there will give you confidence, else you might curl up when the pinch came. Now, get away. Look after your business, and don't get in such a hole again. You might not find an Esdras B. Quilter to back you another time. And remember, Mr Davies, if you are tempted to play with me, that I can break you as easily as I've saved you.' The smile vanished from his face as he whispered the last words into my ear. Then he pulled out his watch and glanced at it. 'Great Scot! I'm due to meet Mrs Q. at the Savoy at four sharp.'

His face clouded over at the thought of keeping his wife waiting, and I saw that there was one person before whom the daring financier quailed. He shook me by the hand, hailed a passing hansom, and in a moment was out of sight.

I went home cheerfully that night. I smiled as I read in the financial column of my evening paper that in all probability the next day's settlement would pass over without any considerable trouble. 'Only one small failure is anticipated.' My wife, who strives, like the good woman she is, to take an interest in matters that concern her husband, read the paragraph after dinner.

'Who is the poor fellow who's in trouble, Austin?'

'Oh, the paper's misinformed,' I answered. 'I heard just before I left town that the account had been arranged.'

'I'm so glad,' she said. 'What a relief to his poor wife and family! Just think, Austin, how we should have felt if it had been us instead!'

It required all the self-restraint I possessed to refrain from telling my wife that I was the poor fellow in question, and how a kindly old stock-pirate had come to my rescue.

Some astonishment was expressed by my friends when I pulled through at the settlement. Many congratulated me; some took me aside and said that they had not come to my help because they were awkwardly fixed themselves just at the moment; now, however, if I needed an odd thousand or so it was at my service. The world is ever ready to help the people who don't need help.

The same day I received from Mr Quilter a copy of his private telegraphic code, but it was a month before I had any further communication from him. Then a curt wire came: 'Leave Home Rails and get on the Consol market.' Hitherto most of my business had consisted in dealings in English railway stocks, though I had dabbled a little in Consols and local loans. However, I had promised to obey Mr Quilter implicitly, so now I followed his instruc-

tions. Evidently, I thought, his speculation has something to do with our national securities. Another month passed, and then I received a letter from Mr Quilter's solicitor. He informed me that he held a sum of a quarter of a million at my disposal to be used according to instructions I should receive direct from his client. Still I heard nothing about Mr Quilter's scheme. I began to wonder whether the stout old gentleman had forgotten his intended speculation. I saw from the American papers that he was busy organising a great bear movement in Yankee Rails.

At last, however, I received a wire in Mr Quilter's private code. It ran:

'For the next fortnight be on the Exchange every minute it is open.—QUILTER.'

I was puzzled; but still, it was easy for me to obey these instructions. Except for the time it took me to snatch a hasty lunch I was never away from my post. I stood there like a sentinel, and some of my friends chaffed me for my extraordinary devotion to business. I waited like this for a week, till there came a wire which made me wonder if my employer had taken leave of his senses:

'When Consols fall to 70 buy every share in the market.—QUILTER.'

'Consols at 70!' I thought. 'He must be insane. Why, they've been hovering round 83 for a month. Can he know something? Is there some terrible international upset on the cards?'

I went on the Exchange puzzled by this strange problem. That day Consols were a trifle higher, and closed at 83⅜. My instructions seemed absolutely absurd. But the next day there were slight symptoms of strained relations with Germany. Prince Bülow made a speech in the Reichstag on the Bagdad Railway, in which some English papers detected unfriendliness towards England. The press of both countries took the matter up, and in a day or two there was a pretty squabble on paper. Under the influence of the unfavourable political situation and the scare articles in the papers Consols sagged down to 82⅛. All the time I was thinking, 'Is Esdras B. Quilter sure that there will be a war?' To me the whole business seemed one of those petty passing disputes which are sure to arise between nations when they are commercial rivals.

At last, on the Friday, I had given up watching the market in despair, and had gone to the bar for a sandwich and a drink. As I stood there I heard a great shout in the House. I rushed back and found the members nearly frantic.

'What is it?' I cried to the nearest man.

'War, they say,' he answered.

I fought my way to the spot where the telegrams were displayed, and read:

'MARCONIGRAM.—The Cunard liner *Lusitania*, with five hundred thousand pounds in gold aboard, was fired on by the German cruiser *Kaiser Friedrich* to-day, and is proceeding under escort to unknown destination.—*Cunard Company.*'

I dashed back and struggled into the centre of the Consol market. Men were screaming, shouting, yelling their willingness to sell Consols. Already the price was down to 80. As it became evident that all were sellers and that there were no buyers, the bottom dropped out of the market. The price dropped rapidly to 78, 76, 74. I had no lack of confidence in Esdras B. Quilter now. A man screamed '72' in my ear. I shook my head. Finally came the roar: '71, 70, 69.' I plunged into the fray and bought every share that was on the market. When people saw me buying a few others took confidence and bought too. But they bought timidly, whilst I took every share that was offered. Men crushed round me wildly and besought me to buy. Finally, when I had struggled in the seething crowd for an hour, the strain was too much for me. I broke down utterly, pushed my way out, and went and sank into a chair in an anteroom. I was absolutely exhausted, and could only feebly wonder how Esdras B. Quilter knew what was coming.

Suddenly there came another wild shout from the brokers. I staggered to my feet and went to a friend.

'What is it now,' I asked—'an invasion?'

'No; contradiction from Berlin. The *Kaiser Friedrich* is not on the Atlantic at all, but in Kiel Harbour. And you've been buying Consols. By Gad, Davies! you'll be a millionaire.'

Just as rapidly as prices had dropped they rushed up again. I could see that I was the envy of my fellow-members, but that did not gratify me in the least. In my heart of hearts I felt that I had been the tool used by Esdras B. Quilter in one of the dirtiest deals that he had ever planned.

The next morning I had a wire from New York:

'Sell. Meet me at Claridge's Monday week. Sailing to-day.—QUILTER.'

Happily, after I had given up buying through sheer exhaustion, others had stepped in and purchased Consols largely. If I was suspected of knowing that the Marconigram was wrong, there were others almost as deeply involved. I waited anxiously for an explanation of the mystery. Then came the news that a cruiser had undoubtedly stopped the *Lusitania* in mid-ocean, had fired a shell across her bows, and ordered the captain to alter his course under penalty of being instantly sunk. The name of the cruiser was the *Kaiser Friedrich*, and she certainly answered the description of the German cruiser. The Cunarder captain instantly sent a Marconigram to warn his company. The cruiser stayed in the vicinity of the *Lusitania* all day, but vanished under cover of the night. All sorts of wild speculations were made as to the solution of the mystery. Did some European Power desire to involve England and Germany in war, and resort to this miserable trick to gain its end? Whatever it was, I felt sure that at the back of this shameful business there was Mr Esdras B. Quilter of New York. I sold the shares I had purchased, and waited anxiously for the time when I should be confronted with Mr Quilter.

At last the day of his arrival in London came, and I went at the earliest possible moment to see him at Claridge's Hotel. The little, stout man beamed at me as I entered. 'Pulled it off all right, didn't we? Didn't I say I'd take it out of the big bugs on your Stock Exchange Committee? Half of them are on the Consols market, and I've squeezed them till they squealed again. Didn't like American business methods, they didn't! Reckon they'll have had enough of one Yank by now. It's as easy clearing them out as it is stealing cents from a blind man's tin. Waal, let's get to business. According to the figures you've wired me we've made five million dollars out of this transaction. Now, putting that little commission I paid you aside, what do you reckon would be fair for your share?'

'Not a single penny,' I said.

He looked at me in a puzzled way. 'What's this derned foolery?'

'I'm certain that in some way you were responsible for that outrage on a British ship. You risked war between two great peoples just to pile up more of your miserable dollars.'

'So you've got horse-sense enough to guess I did it. Simple it was. I've a friend who's agent for one of those ten cent republics in South America. He'd bought a cruiser for them some time since. What was simpler than to put a German crew aboard, disguise the ship by rigging up a false funnel and painting in a fake name, and paying crew and captain handsome to commit piracy on the high seas? If that Cunarder captain hadn't been enterprising enough to use his Marconi instruments Esdras B. Quilter would have got left, badly left, sir. But I calculated he would be smart enough. What if he did fire on a British ship? I'm as patriotic as any blamed Britisher; but I tell you I don't sing "Yankee Doodle" in business hours. Now, what do you estimate your share to be—allowing for your wounded feelings?'

'I told you I wouldn't take a penny. Do you know you might have brought about a great war—that you might have shed the blood of millions of men, each one of whom would have been worth twenty miserable money-grubbers like you? I've done your dirty business because I promised you, and because I was kept in the dark; but if I had known your shady tricks I'd sooner have let myself be hammered twenty times over.'

The smile had vanished from Esdras B. Quilter's face. He wriggled in his chair. 'Are you mad? Why, it's the straightest kind of business. Are you in business for your country's health, or the Kaiser's, or your own? What do I care, an American born and bred, what happens to you back-numbers of Britishers or German lager-swillers? I said I'd smash your Stock Exchange Committee, and I'd do it if I set every nation in the universe at each other's throats. A Britisher like you to tell me how to do my business! Why, you're as low down as—as—one of your blamed Stock Exchange Committee. Take care what you're doing. I've smashed better men than you before breakfast. Why, what do you think I've made this money for, sir? Every cent of it will go to the Esdras B. Quilter Homes for Poor Widows—the philanthropical sensation of the century. Get out of my sight; you make me tired. Never so long as you walk on two legs will you do another stroke of business for Esdras B. Quilter.'

And thank Heaven I never did.

SKYE FAIRIES.

Over the hills and far away,
Up the glen where the fairies stay,
Come away, children! come away,
For the world is all before us.
Hark to the wild wind's whispering!
Hear what the rushing rivers sing,
While fairies and we are listening
To the glorious happy chorus.

Fairies everywhere! How they hide
Down by the stones at the river-side,
Riding the heather-bells astride,
You can hear their joyous laughter!
For a fairy's life is gay and free,
And a fairy babe, it seems to me,
Is as happy as any babe should be,
With the heaven for roof and rafter.

This is the land of magic streams,
The sun on the water glints and gleams,
And lulls one into sleepy dreams
Of the world-just-round-the-corner,
Where life is ever a sunny morn;
Surely not here was the poet born
Who sang of fairylands forlorn—
There are leagues of land forlorner.

Hills of purple stand grandly steep,
Each like a giant o'ercome with sleep,
Hiding his mysteries grim and deep.
Will they nevermore awaken?
Perhaps they stir in the stormy night,
And like shrieking ghosts arise and fight,
Filling the darkened world with fright,
And rent rocks wildly shaken.

To rest again at the break of day,
Swathed in a mist-veil soft and gray,
The mountain giants quiescent lay,
With never a tale for telling.
But gnomes work hard beneath the rocks,
Dig and delve in their close-ranked flocks;
No fairy ever really mocks
When there's fairy gold for selling.

Up, then, children! up and away!
Time for us is but time for play;
Dance and sing and be always gay
With a fairy friend for neighbour.
For youth comes once and never again,
Sunshine fades in the tears of rain,
And pain and joy and joy and pain
Are all man wins of his labour.

THE HEART OF THINGS.

By Henry Leach.

London, *Jan. 20th.*

PARLIAMENT will be meeting soon, and even if the times are not exciting compared with what they are when ominous international complications are in progress, and there is interest in what is being done at the War Office, still there is always a little group of more or less superficial politicians—people whose interest is mainly on the personal side, and to whom a Cabinet Minister is not like any other person who walks on legs—waiting on the pavements and about the doors in Downing Street to watch the great men enter for the beginning of the business of another parliamentary season. They can tell who each Minister is without troubling to look at the faces or even making a momentary study of the way of walking, for they all have their peculiarities, or at least they had them in the days of the long Conservative Ministries. One right hon. gentleman would always be seen accompanied by a stout umbrella no matter what the weather might be, while another would never be provided with any such protection despite any apparent discomfort that might be occasioned to him by his waywardness. Some Ministers would wear tweed suits and bowler hats, with no overcoats; and others would always be most immaculately attired in black frock-coats and glossy silk hats, with the extra embellishment of a heavy fur coat if the cold made justification for it. And yet another Minister would often be seen with his little dog. The types may not be so distinct in these later days; but still there are marks by which you can tell the Minister almost in the dark. The people who like to make these periodical studies on the kerbstones and at the doors of Downing Street were perturbed of late by an official announcement that for the future this famous street is not to be a public property in the same full sense that it has been in the past, and that, in fact, a Bill is to be introduced in Parliament forthwith, one of the objects of which is to 'stop up and discontinue as public thoroughfares' certain streets of which this was named as one. But the announcement was not quite so serious as it seemed, for it simply meant that the Office of Works was about to take over the control of these streets from the Westminster corporation, which has been their ruling authority for many years, and that it desired to have a power of stoppage that does not exist at the present time—a power which it is little likely to exercise save in very exceptional circumstances. It would, indeed, be a sad thing if the general public were to lose its Downing Street—that magic thoroughfare to which the leading-strings of the Empire converge, and where they are daily pulled in secret with an effect that is sometimes known later through the medium of the daily newspapers, but which is oftener undisclosed. It is difficult even for a dull man—perhaps more difficult for him than any other—to walk along Whitehall and past the end of this street, at a time when the Government is busy, without vaguely wondering to himself what is going on inside those sacred places. Because, whatever is must surely be just a little awful. Many books have been written about the old squares and streets of London town, and there is still room for many more. If the average Londoner of impartial tastes as to roads and streets were set the task of writing one more book about any thoroughfare of his own choosing, his thoughts would wander down Cheapside, would linger in the Strand, and would hesitate seriously in Piccadilly; but we doubt not that at last they would often settle in old Downing Street, because it would be so easy to write a book about that street, an enlivening book full of the matter and the incident that would interest most men of Britain, full of the pointed tales of the things and the people that have mattered most in the last two centuries. The street is called after the name of Sir George Downing, who was secretary to the Treasury in the days of the second Charles, and about his time it was described as 'a pretty open space, especially at the upper end, where are four or five very large and well-built houses, fit for persons of honour and quality, each house having

[*All Rights Reserved.*]

a pleasant prospect into St James's Park, with a terras-walk.' And the 'persons of honour and quality' who have lived their official lives there since that time include Sir Robert Walpole, Lord North, Mr Pitt, Lord Melbourne, Lord Beaconsfield, Mr Gladstone, and a number of other statesmen celebrities of the first magnitude. When Peel was Prime Minister he never lived there, being disinclined to leave his home in Whitehall so close by. However, he transacted his official business there, and it is a curious and little-known fact that a charge used to appear in the annual estimates presented to Parliament in the usual manner for a small annuity for the sweeper who used to keep in order the crossing at the end of the street that the Prime Minister might not soil his boots on his way from Whitehall to the Treasury. Strange scenes and solemn, others that have been thrilling, have been enacted in these houses of Downing Street, but in particular at the world-famous No. 10, which is the official residence of the Prime Minister. Here wars have been decided upon, and here on one hot Saturday afternoon in June, long way back in 1872, might have been seen (but only with a ministerial passport) the curious spectacle of the whole Cabinet being absorbed in a game of chess which was being contested by two of their number. That afternoon the Cabinet was waiting for a telegram announcing the decision of the *Alabama* Court, and it grew very tired of waiting as the hours went by and no telegram came. 'Upon my word,' said Lord Granville, 'if we all sit together like this for very much longer we shall in the nature of things quarrel! Let us get a chess-board.' And when it was produced—they always do seem to be able to find anything in Downing Street without going outside—the Government filed out on to the terrace, Lord Granville threw down the glove to Mr Forster, and they set their pieces out against each other. Scenes sad and solemn? Was ever one more so than that which was presented when Mr Gladstone said his last 'Good-bye!' to his last Cabinet in 1894? For as Mr Gladstone was a great lover of Parliament, so also he had an affection for the official life of Downing Street that has not existed in the bosoms of other Premiers. In his own private diary he wrote that that was 'a really moving scene.' Lord Kimberley and Sir William Harcourt made kind speeches of acknowledgment and farewell, and in a low tone the chief replied for four or five minutes. Then he seemed to breathe rather than speak the final words, 'God bless you all!' but all heard them, and as Mr John Morley has told us, 'he went out of one door, while his colleagues, with minds oppressed, filed out by the other.' Yes, the drama of great affairs is acted here in Downing Street as in no other place. There is a little comedy; now and then there is awful tragedy; but the note that seems to be sounded oftenest is the one that dings through all human life, the note of pathos.

If circumstances permitted of those eminent Byzantian architects of the time of Justinian whose names were Anthemius and Isodorus taking a walk through London in these days they would find much to interest them, and Anthemius would remark to Isodorus that he was dimly reminded of something that he saw some fourteen hundred years ago; which would provoke the reply that that was surely so, since it was a faint copy of what they themselves had fashioned. It is so. We are, so to speak, going over to Byzantium in the matter of our architecture, and the towns and cities of the provinces, who often enough take their time from London in great matters like these as well as in the trifles of newspapers and clothes, will perhaps go over to Byzantium also in due course. In the present age we are copyists. The workers in every branch of art and craft have the models of the old and famous schools to copy from, and they do so often copy without struggling to the initiative of raising up models of their own and establishing them with a creator's arrogance throughout the land. Perhaps for our own æsthetic sense it is better that we should thus frequently draw from the rich and varied stores of the past, and enjoy the genius of a hundred ages instead of limiting ourselves to one. It may be also that some of us mere wanderers through the town give too little credit to the school of to-day, if it does exist; but, to take the matter of houses only, it does seem that the last of a distinctive character were those of the Georgian times with which streets in Bloomsbury, Kensington, and some of the inner suburbs are still filled, houses plain enough in their way, but of a pleasant plainness and telling a little of the life of their youth by the iron balconies at their first-floor windows—balconies upon which smiling and weeping women stood as they watched the soldiers march along on their way to the wars. Villas we have now of a modern fashion which for politeness we may call chaste, but which in a less agreeable mood we should rather say are smug. But for the architecture of the town, the big things, we have ranged over the models of all ages and all nations, and here we have now a medley—a fine thing, a rich thing, but still a disordered medley. One must repeat that this is merely the untrained impression of the casual wanderer. But there is a sign of a change at hand, or as yet it may not be a change, but merely the strong conspicuousness of a comparatively new element. It is four or five years since the new Byzantian in London first closely attracted the attention of one observer, and since then the same note has been struck anew in many parts. Here there is a new restaurant being raised in great magnificence on a Byzantian design of architecture; then it is the new building of an insurance company or some semi-philanthropic institution of that kind. Somewhere else we find Anthemius in a lordly house that is being built for a most eminent personage, and in another place it is Isodorus at a theatre. Pillars and domes, grand and bold—a touch

of the strength of empire in it all—this taste for the Byzantine does seem to be in harmony with the spirit of the age and with the mighty force of London. As a crowning piece to this Byzantian London there is the new Cathedral at Westminster. It is an established taste, and it is spreading; soon we shall see the results of it on every hand. The other day we were at an old railway station in process of reconstruction, and it seemed that even there, from the chaos of scaffoldings and disordered timber and stone, there was a sign of Byzantium emerging. Lately we were speaking of the Napoleon fetish that pervades the time, and now it is Byzantium in stone. It seems to be the imperial way.

* * *

Recently a welcome letter came to us from a reader of these special pages, who is an old Londoner and lover of London, but who for a long time has been living in one of the farthest distant of the British colonies. He told us that he was well pleased to hear now and again, as it were, a little pleasant talk about things that were familiar and dear to him—haunts, places, people, and actions—that wonderful cosmos that makes up the life of the town. But now and again there were intimate allusions to things which he did not understand, of the existence of which he had never heard, but which were now evidently such an integral feature of the system of things that a knowledge of them and their circumstances was taken for granted. So he was led to a somewhat uncomfortable thought as to whether when he returned to the big town in a few months' time, as he will be doing—the first visit after many long years of absence—she will be quite the same to him as she used to be, whether he will like her in all her new dresses and ornaments in the latest style and fashion of science and enterprise—and hurry. We will hope that our colonist will like his London as ever he did, but certainly he will find her changed, and he may at times have difficulty in recognising her. We gather that he is a man of reading habits, and we suspect that soon after he has set foot again in the town he will take a horse omnibus or a hansom—he may hesitate as to the use of the motor-bus or the taximeter-cab—and will make for Booksellers' Row, which, as he knew it, was at the eastern end of the Strand, there to see what priceless little bargains in old and discarded literature may be picked up for a few pence that will give pleasure to his mind and awaken happy recollections on long and lonely evenings when there is again half a world between him and Booksellers' Row—or the place where it was. Alas! he will find that the famous alley and all about it has gone, has been utterly demolished and removed from the face of London; and not only will he not be able to find it, but he will not be able to tell with any certainty exactly where it was, for the surroundings have been altered also. Hereabouts, instead of grimy old buildings that were strongly suggestive of slums behind, instead of those old bookshops, instead of the various spirit-houses that there were about, and the shabby little theatre that went by the name of the Opera Comique—instead of all these things and many more there are now fine, wide, new thoroughfares, magnificent hotels and theatres erected on the most splendid models, wide building spaces to let for which record rents are being asked, and a noble statue of Mr Gladstone, given to London by the people. This place where our returned wanderer will hurry, anticipating the long morning or afternoon in his Booksellers' Row, is a semi-slum no more, but rather is by way of being the capital or centre of the newer London—which reminds us that one of the effects of all this change has been to remove the centre of gravity of London life, as it were, a little farther east.

* * *

Who shall say that in two centuries from now Whitechapel shall not in some respects be the equal of the Strand? The people who have been living in the inner suburbs are being driven out from them by excessive rents and rates, when their own disposition would be to move farther in, and yet in the great slum-quarter, which, if it were fired, cleansed, and rebuilt, would make an ideal residential quarter for a large proportion of the middle-class workers of London, the cost of house-room cannot at present be as much as half or even quarter of what it is in those suburbs. In a very little while this is almost certain to be a feature of new schemes for the reconstruction of London—the exploitation and improvement of the East End. If we had now to build London afresh from the beginning, what a very different London would it be! It would be partly a blend between New York and Paris; but it would be different from either, and it would be so convenient, so new, so thoroughly what it ought to be, that life in it would be a quite impossible bore, and its residential population would decrease alarmingly. It is a good thing that we have to remodel our London by a slow process, and that only the men who have been on duty at the outposts of the Empire for a long time will be much concerned at the changes that have been made during the past few years. Coming home they must cultivate agility, for they will have less time to cross the streets than they had in the old days, and the streets are wider. Always they are wider; there is not a main thoroughfare in London but in some part or other is constantly in the hands of the builders, the buildings always being pushed back and back. Room for the traffic—room for the traffic—that is always the central idea of every scheme; and one sometimes thinks that if Sir Christopher Wren had a disposition that was at all of a revengeful turn, he would keenly have enjoyed a study of the London streets from the top of his St Paul's Cathedral now, towards the end of the first decade of the twentieth century. For everywhere they are struggling with those

streets, trying to make them something like what he advised they should be—his advice being rejected. Wren saw farther than his age. He was what we would call a big Londoner, and he drew up a plan for three fine streets that would run east and west, at least ninety feet wide, with one or two cross streets, all to be quite straight. The lesser streets were to be of a width of not less than sixty feet; there was to be a quay of a width of forty feet, free of all buildings, alongside the bank of the Thames, and the Fleet ditch was to be turned into a canal. But Wren had few sympathisers with him in these projects, and the merchants of Thames Street were largely responsible for their overthrow, though the Fleet ditch itself was somewhat of a stumbling-block.

* * *

There is a reaction from every movement that advances far and quickly, and now and again there is evidence of reaction in some quarters from the effeteness of our civilisation, as it has been called. Such reaction takes many and curious forms. A year or two since we heard much talk of the simple life, and of the manifold advantages to both body and spirit that accrued from living it. But the simple life is not so popular now as it was for ten days or a fortnight at the time when it was being talked about so much. Now, in the course of the reaction in another direction from too much civilisation, it is the turn of the primeval instincts to be taken up, discussed, and generally made much of. You hear portly City gentlemen, going to the City or returning therefrom in first-class railway carriages, tell each other that what they like so much about some new habit or diversion that they have taken up is that it is so 'natural,' that it represents so much of a primeval instinct, and consequently must be good, essentially good. They have been saying for some time past—and very likely with truth—that the amazing spread of the game of golf is due to the fact, discovered on analysis of the emotions excited, that it soothes and satisfies the primeval instincts, and that there is something intensely 'natural' in wandering over green fields and alongside the slopes of hills, simply pelting a little ball along, and defying, or at all events contending with, all the obstacles that may be encountered, all the little roughnesses on the face of the earth that nature made. In wind or in calm, in sunshine or in storm, the golfer, in as rough things as he will care to wear, is out alone satisfying his primeval instincts! Then they say, more curiously, that the motor fever is due to the assertion of these instincts. There is little that is primeval in six cylinders and a vessel of petrol; but we may suppose that the original instincts are present in the case of the wild, hurtling rush along the roads, the sense of great danger to others as well as to the riders that is created, and the general feeling that there is life and space and speed, and very little besides that matters at all. But, after all, one cannot get very far with the primeval instincts on the strength of golf and the motor-car alone, and there have been signs for some time that something more primitive was needed, something a little more like barbarity, with a suspicion of blood about it. It has come at last. A few weeks since the prize-fight was revived after a long absence from official London. There are fights every Saturday night 'in the season' at a place of entertainment in the East End which makes a speciality of them, and for a shilling one may have a good seat for the spectacle of some of the most determined milling, which, though chiefly intended for the East End population, is nevertheless frequented in disguise by folks of social eminence from the West. But this is not in what we call official London; it is not recognised as part of the established taste and custom of the town. Lately, however, there was elsewhere a real fight between champions of England and America, and there was all the old-time glamour about it—beforehand. The House of Lords was properly represented at the ringside. Now observe: many years ago when pugilism was flickering out in this country there were general condemnations of it by the public and the Press, as being a thing that was quite unfitted to the civilisation of the time, a brutal, coarse thing that ought to be stopped for evermore. So it dropped out. And now? Its return is applauded by the public and the Press, who rejoice at this encouragement of the primeval instincts. Well-known writers were set to extol this pugilism, and leading articles in the newspapers reminded us that the great men of all time had loved to see a good fight; that thinkers and writers, men like Hazlitt and Borrow, had dealt with the subject most sympathetically, even lovingly; and so forth. It was said that there was a great deal that was noble in two men standing face to face with each other to fight to a finish, to cuff and beat each other until one of them could neither stand nor see. Such men, it was said, must have fine limbs, great nerve and courage, and fine endurance. Indeed, it was declared that it was unflinching endurance such as this that is just the very thing that this period of trouble and strenuousness calls for; that England has need of men who do not flinch at times like this, and it was almost suggested that the mere watching of them created the capacity for not flinching, and would therefore be good for the nation. The primeval instincts! 'The thing that the times call for.' It is suggested that even clergymen were sometimes sympathetic towards the idea, and few people made harsh comments on the circumstance that one of the demonstrators of the working of the primeval instincts asked to see that the prize-money was ready and waiting before he began his demonstration. Perhaps such a far throw-back to the primeval as this is a little too much at once. Anyhow, despite great efforts, the new pugilism does not seem to catch on, for all that so much has been made of it, and it has been nicely blessed in many places.

How strange are the contrasts of the world and the town, though we do not always appreciate or even notice them! We have been talking of the primeval instincts that were given play at a fight in Covent Garden. Within a stone's-throw of this place tightly packed crowds of people had been exulting night after night in the discovery of a new queen of song who was to be exalted to a topmost place in music—had already been so. Tettrazini was being worshipped. They said there was none like her, and the lovers of song and melody lived for a season in an ecstasy of delight. This also was in Covent Garden, and who knows but that if Tettrazini had been singing that night the victor-pugilist with all his gains might not have called in to listen when the fight was over, as showing that the instincts patronise each other? And a little farther away, out in the east of the town, there was at the same time another contrast in the matter of these instincts. It was in the roughest part of London, and a bishop was kneeling at the bedside of a vicar who lay dead, the bishop praying that the Church might be forgiven for the wrong that she had done to the dead man. It was one of those sad tragedies in which this world can still glory and thank Heaven for their happening. This dead priest had died of overwork and illness made by it among the poorest and in many respects the most disreputable people that are to be found in the Metropolis. In the conventional euphemism his charge was 'a difficult one.' He was a young man, and he gave all his strength and all his health. He had a little means, and he gave it all to his people, and was poverty-stricken. He patted the young hooligans on the back, and made them whimper that they would do better. They thought they would. He walked hand-in-hand with the children, brightened the lives of hard-worn mothers, encouraged the fathers to better things. He was a ray of sunshine amidst filthy, black surroundings. It killed this young man, and the bishop prayed at his bedside while they were still talking in the streets of the fine revival of the primitive instincts and the glory of the prize-fight at Covent Garden.

A PAWN IN THE GAME.

CHAPTER XI.—THE TWO WILLS.

THE other counsel was in his chambers, and proved reasonable, and the disputed will was readily produced. The doctor examined it carefully, passing over the faint characters that purported to be the signature of John Lawrence, and scrutinising through his magnifying-glass the smudge on the edge of the paper.

'Yes, *that* is my signature,' he said, pointing to the written characters, 'but *that* is somebody else's,' pointing to the smudge; 'and *that* is *not* John Lawrence's signature. The thing is a fraud. My senses were all about me in that sick-room. Somehow I felt there was roguery in the air, and so, I think, did your brother; and that'—pointing to the document—'shows our suspicions were just. The key to the fraud lies under that smudge. Find out the thumb that left that mark. Its owner is the rogue, and, I suspect, the major-domo. I did not like his shifty eyes and furtive look at the time.

'I can guess now how he performed the trick. I took the will from your brother's hands as he seemed about to faint, and gave it to the major-domo, and for nearly half-an-hour was attending to the sick man. For that time the will which carried your brother's signature, but which I had not witnessed, was in the scoundrel's power. He took it with him when he left the room. I am sure of that, because he had to be called into the room when I was ready to witness the will. He came after a delay which, I remember, exasperated me, and brought it with him. He must have had the second sheet ready all the while, watching for a chance to substitute it for the true will when the time came for signing. But your brother made me read the document before he signed it.

'When he fainted, and the rogue had possession of the signed will, and was able to take it out of the room for a few moments, he forged your brother's signature on *that* paper,' pointing to the sheet on the table—'not a difficult task for such clever fingers. Then, to make it agree in appearance with the genuine will, he put on the smudge of ink. When called into the room he solemnly put this on the table for me to witness. He must be a cool and daring rogue, for he took a tremendous risk. But I was in a hurry. I saw on the sheet what I thought was your brother's signature. I knew I had made a smudge on the paper, and a smudge was there. So I signed it without reading it and detecting the change.'

Dr Graham looked as if he still were heartily ashamed of himself. A Scotchman to have been tricked so coolly by a Frenchman, and in such a business as the signing of a will which affected nearly half a million's worth of property! 'D—— the rogue!' he said heartily.

'The story is plausible,' commented Lempriere, 'but there is no legal proof.'

'But,' said Dr Graham hotly, as he held out his magnifying-glass once more, 'look at the difference of the two thumb-marks. They are more unlike than two faces. *That* is my mark, and that is *not* my mark.'

The lawyers examined the two smudges afresh with great care.

'It is odd, no doubt,' said Lempriere; 'but the

courts have never yet admitted evidence of that character.'

'Give me the print of the major-domo's thumb,' cried Graham, 'and I will stake my head it is the transcript of *that*;' and he pointed to the smudge on the witnessed will.

'That is a rash wager for a Scotchman,' said Robert Lawrence; 'a good Scottish head for a Frenchman's thumb. But how can we get it?' And the lawyer knitted his brow meditatively. 'Will you,' he said at last to Lempriere, 'ask the scamp to dine with you? After all, he has the manners of a gentleman, and he represents your client. You need not take him to your house; dine with him at one of the coffee-houses. Let the doctor be the third man in the party, and trust to his wit to get the print of the Frenchman's thumb. I cannot be there, for it would be unprofessional, as I represent the other side. But he is your client,' he repeated, 'and Graham is your witness.'

'Yes,' said Lempriere reluctantly. 'I do not like the business, but I like the flavour of a possible fraud still less. The man,' he admitted, 'looks and dresses like a gentleman, and so, doctor, you shall have the chance you want. If there is a fraud, and a French fraud, too, designed to rob an English boy of his estate, I do not think that my professional duty requires me to prevent it being found out;' and Lempriere, a good lawyer but a sound Tory, who, like all the Tories of that age, thought it part of their religion to hate a Frenchman, laughed dryly.

Lempriere found no difficulty in arranging for the dinner-party.

'Dr Graham,' he told the Frenchman, 'is not a very friendly witness, but he might be of importance. When the case comes into court we shall be obliged to call him, and so you had better meet him.'

Two nights later the party met at a famous coffee-house in the Strand, and dined together. The lawyer was surly and ill at ease, as if taking part in a business he disliked. But Dr Graham was chatty and pleasant. The dinner was good, the wines of the best; and M. Duclos, who was plainly on his guard at first, relaxed, and showed himself an excellent talker. He had much to tell of Paris and the wild doings there, and the tangle and distraction of its politics, to which the other men listened with unaffected interest.

Then the talk was turned adroitly on India, and the doctor was rich in anecdotes bearing on the subtlety of the Indian intellect and the cleverness of Indian rogues.

'Let me tell you,' he said, 'one of the oddest stories I know. But to understand it we must try a little experiment first.' He told the waiter to bring the inkstand, and, taking up a dinner-card, he coolly let fall a drop of ink on it.

'Now, Mr Lempriere, put your thumb on that and press it steadily for a moment. Now, initial the smudge so as to identify it by-and-by.'

He then put a second drop on the card, and asked M. Duclos to do the same.

The Frenchman hesitated for a moment, but he hardly knew why. The incident seemed natural, the doctor was waiting with the outstretched card, and the Frenchman pressed his thumb upon the drop of ink and then initialled the mark. The doctor, in his turn, went through the same process. The blots quickly dried, and then the doctor produced his inevitable magnifying-glass.

'See,' he said, as he bade them examine in turn each smear, 'it is a clear enough print of our thumbs, and how distinct the pattern of the lines is in each case! Nature never repeats her ciphers. This is a scientific identification of the human hand, and of the owner of the hand, which can never be cheated.'

Then he told how the thumb-mark was used for purposes of identification in India, and related an amusing tale of how a rogue had been detected by the print of his finger-tips, and punished. When he finished the story, as though in a careless fashion, he slipped the menu-card into his coat-pocket.

The little party broke up early, but Lempriere and the doctor lingered for a moment after the Frenchman had gone.

'I will call in the morning at your office,' said the Scotchman, 'and we will compare the thumb-mark on the alleged will with the print M. Duclos has left on the menu-card. If they are identical, is not my case proved?'

'Well,' answered the lawyer cautiously, 'I will not say that, and I am not the full court. But at all events it will be important if the two impressions prove to be identical.'

The next morning the doctor and the two lawyers met in Lempriere's chambers. The conflicting wills were produced, and the menu-card with its initialled smudges lay beside them.

'Look how different are the three marks on the dinner-card,' said the doctor, as he put his magnifying-glass over them in turn. 'They are separate and unmistakable. This is my own; compare it with that on the will which lay for three years in my coat-pocket here in London while I was in India.'

The two legal heads bent in turn over the prints.

'Yes,' Lempriere admitted, 'the smudges are twins. Each is the transcript of your thumb, doctor. Who could have believed that a tracery of lines so definite and unmistakable in pattern was hidden under that ink-stain?

'Now,' he said with energy, 'let us compare the print the Frenchman left on the menu-card with that on what is averred to be the true will. If they correspond exactly with each other, doctor, your case is proved; and whether the courts accept your evidence or not, John Lempriere will not lend his wit and time to help a fraud.'

'You agree that the thumb-mark on that will is not mine?' asked the doctor.

Then he put the print of M. Duclos's thumb, as it

stood on the menu-card, beside that on the will. Each of the lawyers in turn examined it with minutest care.

'Yes, doctor, that is the rogue's thumb-mark.'

'D—— him!' cried Lempriere. 'He had to reproduce the smudge to make the two documents agree, and in doing that he supplied the proof of his own villainy. I shall throw up the case. I think I ought to ask the court to impound the documents and to prosecute the scoundrel.'

'No,' said Robert Lawrence; 'we need not do that. If the Frenchman finds his trick is detected he will take himself off. We can let both the wills drop out of the case, and the boy will inherit as his father's heir.'

After some debate this was agreed upon.

The next day M. Duclos, by appointment, called at Lempriere's office. The doctor sat at the table as he entered, and the Frenchman's vigilant senses warned him instantly that there was danger in the meeting. He sat down at the table and looked with keen and watchful eyes at the pair of grim faces opposite him.

'M. Duclos,' said Lempriere, going straight to the business, 'you left that print of your thumb on the menu-card a couple of nights ago; but when did you put *that* mark on the will?' and he pointed to the sheet of paper that lay on the desk before him.

'That is not the mark of my thumb,' replied the Frenchman steadily. 'Dr Graham ought to remember that he is responsible for that smear.'

'No,' cried Lempriere; 'if you choose to examine them you will see that the two prints are identical.'

The Frenchman waved the magnifying-glass aside carelessly.

'One thumb-print is very like another.'

'Ah, that is where your scientific ignorance has led you into a trap,' said the doctor.

'My ignorance, scientific or otherwise,' answered the Frenchman, 'hardly affects a legal question.'

'But this is a question of hard facts,' exclaimed the lawyer, pointing to the mark on the paper.

'Dr Graham knows perfectly well that he put that smear on it.'

'No,' replied the lawyer, pulling out a drawer and producing the other will; 'here is the print of Dr Graham's thumb; and,' he added, 'here is the will John Lawrence signed. Whoever put his thumb-print on that sheet'—pointing to the false will—'forged the dying man's signature; and since that thumb-print is certainly yours, M. Duclos, you are responsible for the fraud.'

The Frenchman had gone suddenly white. His hands clutched the edge of the table as though to keep him from falling. His eyes flitted to and fro like those of a hunted animal. But he had an admirable courage.

'You hold a brief, Mr Lempriere,' he said, 'for madame. Is it the fashion for an English lawyer to trap his client?'

'An honest man,' replied the old lawyer sternly, 'does not fear traps; and an English lawyer when he finds he holds a brief for a fraud gives up his case. You had better go back to Paris, M. Duclos,' he went on coolly; 'you will find there a field better suited to your genius than London offers. When your case is called on I shall tell the court I withdraw from it, and I shall keep these documents. If any attempt is made to revive the case I will use them against you.'

The Frenchman looked at the two faces—the doctor's strong Scottish features, the lawyer's legal brow and his shrewd and penetrating eyes. Here were forces, he knew, too strong for him. But he was not unequal to the occasion. He rose and bowed with elaborate politeness.

'I see,' he said, 'that in England justice learns to be patriotic. A Frenchman fares ill—because he is French.'

'No,' replied the lawyer; 'but rogues on this side of the Channel are a little less triumphant than on the other side. You had better go back to Paris, M. Duclos. It is your natural field.'

(*To be continued.*)

THE MONTH: SCIENCE AND ARTS.

HEAT-PRESERVING WITH HAY.

EVERY mother who is compelled to nourish her child by artificial feeding realises the great difficulties encountered during the night in preparing and heating the food for charging the feeding-bottle. A convenient method of surmounting this trouble, by means of which a sufficient quantity may be prepared to last a whole night without any deterioration of the food or decrease in the heat, is the employment of what is familiarly termed the hay-box. This comprises a small wooden box equipped with a lid that slips well over the top. The interior of the box is well packed with hay, and within this is buried the vessel containing a whole night's supply of food which has been previously boiled and prepared, ready for eating, in the usual manner. The receptacle with its boiling contents is placed in the hay-box, covered with a thick layer of hay, and the lid slipped on and securely fastened. In this condition the milk will keep very hot for several hours—certainly a whole night. When the food is required, all that one has to do is to remove the lid, draw off sufficient to charge the infant's bottle, replace the stopper, and reinsert and pack the vessel in the box. So slight is the loss in the heat when stored under these conditions that probably when required the food will be found too hot

to administer to the child, and care should therefore be exercised to let it cool sufficiently—that is, to one hundred degrees, or blood-heat. Not only does this simple expedient save a considerable amount of trouble and preparation during the night, but the food is better preserved and more quickly available for the child. The system can be adapted to several other uses, such as, for instance, preserving comestibles hot for consumption at any time; and, owing to the heat-retaining qualities of the hay, such articles as vegetables and meats continue cooking when inserted in the box in their hot condition. The system is especially applicable to the artisan who for six days in the week invariably has to comfort himself with a monotonous cold midday meal. By this means the hot dinner can be stored in the box just before he sets out on his daily task, so that at dinner-time he has a steaming-hot meal. The box need only be of small dimensions, and can be made for a few pence, while similarly the requisite supply of hay can easily be secured, and the only attention requisite is the changing of the preserving medium from time to time. In Germany the hay-box is coming into extensive vogue for heat-preserving purposes, and various types and sizes have a ready sale. In the latter case other substances than hay are generally utilised, but this simple and easily procured material is the most efficient.

A NEW PROCESS OF CAULKING LEAD JOINTS.

The difficulties of jointing gas and water pipes, especially in street mains during wet weather, are well known. The usual procedure is to insert first a few layers of hemp into the joint-socket, and then to fashion a clay pug-mould round the periphery of the pipe, into which the molten lead is poured and directed into the annular space between the two pipes, the operation being completed by caulking to ensure a perfect joint. If the trench contains an accumulation of water such as results in rainy weather, the operation is of great difficulty; while, furthermore, it is imperative that no moisture should exist upon the surfaces into which the lead is poured, otherwise an imperfect joint results. With the new system, however, the operation is considerably facilitated and expedited, dispensing with molten lead altogether, while no care has to be exercised in securing perfectly dry surfaces; and the work can be carried out irrespective of weather conditions without the slightest apprehensions concerning the perfection of the joint. This end is achieved by means of what is called 'lead wool,' consisting of pure lead cut into fine strips by machinery. The wool is produced in strands or skeins, each weighing about a pound, the thread sections being approximately three feet in length. In making the joint all that is necessary is first to insert the usual layer of hemp, and then to feed in the lead thread in layers until the space is filled. By means of a caulking tool the threads are then pounded into a solid mass, the strips welding firmly together, further layers of thread being applied and caulked down until the space is filled to the desired extent. When the operation is completed the leaden threads form a homogeneous solid mass, filling every interstice. The joint thus formed is considerably stronger and capable of withstanding a far greater pressure than that produced with molten lead, and can be effected much more quickly and cheaply.

HOW TO MAKE WATERPROOF WHITEWASH.

The hygienic properties of whitewash are well known, but it has the objection when applied under ordinary conditions of lacking durability, while at the same time it cannot be washed or cleansed. In certain districts in Queensland a waterproof whitewash is in general use, and it is very simply made. The recipe is as follows: One pound of glue is dissolved in three and a half pints of water. To this is subsequently added three ounces of bichromate of potash dissolved in half-a-pint of hot water. These two ingredients are thoroughly well mixed, and enough whiting then added to secure the desired consistency. The mixture is applied to the walls or roofs in the usual manner, and dries rapidly, while the action of the sun upon the potash and glue serves to render it highly waterproof. Such a whitewash is available for a variety of applications, both exterior and interior. It adheres firmly to slate, glass, metal, masonry, or plaster, care being taken in the last-named instance to rub the fluid well into the fabric. It not only affords an excellent protection to the sun's rays in tropical climes, but acts as an admirable waterproofing to walls exposed to driving rains. When desired it can be cleaned with a hose and cold water or washed down with a sponge. Of course, any required quantity can be prepared, it only being necessary to adhere to the foregoing proportions.

DANGEROUS SWEETS.

From time to time instances occur of children being poisoned by eating common varieties of sweet-stuffs. Only recently an important prosecution was levied against a cheap form of chocolate that was sold in the streets of London, which under the searching examination of analysis revealed a remarkable concoction, the most important feature of which was paraffin-wax manipulated so as to resemble the creamy contents of chocolate, the latter itself being an extraordinary and highly injurious noisome compound, flavoured and coloured. More recently the Durham inspector under the Sale of Food and Drugs Acts drew attention to the grave injury accompanying the consumption by children of sweets containing chloroform. The worst offenders in this instance, it appears, are those known as 'chlorodyne gums' and 'chlorodyne lozenges,' usually sold at a penny per ounce. When the composition of these gums and lozenges was investigated, it was found that they contained 0·5 and 0·05 minim of chloroform respectively per lozenge. Other sweets of the chocolate variety were found to be equally as dangerous, since they con-

tained alcohol in varying quantities. Considering the pernicious habits arising from the eating of such confectionery, the authorities should exert a searching vigilance in regard to their manufacture, and render the utilisation of such harmful drugs impossible.

SOME NEW PATENT FUELS.

To the evolution of new fuels prepared by patent processes either in a solid or liquid state there appears to be no end. One which has recently been brought out by a French inventor is named 'charbonnette,' and is stated to be produced for about two-thirds the cost of coal. It lights easily, and, rapidly becoming incandescent, no smoke is emitted, while at the same time it gives out intense heat and leaves scarcely any ash. It is manufactured in briquettes, and its main features are cleanliness in handling and the absence of smell. It is stated that the preliminary tests have been so satisfactory that a manufactory of forty thousand tons annual output is to be erected. In the second case the fuel is of the liquid type known as 'masut,' and is one of the by-products of petroleum distillation. Among its advantages are stated to be great heat-yielding qualities, accompanied by little smoke, and it is already in use among certain European navies. This product is stated to be easily obtainable from the oleiferous tertiary coal-beds, and for this reason its manufacture should be susceptible of extensive development in this country, especially among the shale-oilfields of Scotland.

AN IMPROVED DUPLIGRAPH PRINTER.

At the present time many systems for duplicating purposes are in use in the up-to-date commercial house to expedite and facilitate the work of the office. Recently an American invention has been placed on the market, the features of which are extreme rapidity, cleanliness, reliability, and adaptability, it being possible to secure copies of work executed in typewriting, by pen, or copying-pencil at a speed ranging from twenty to a hundred copies per minute, according to the nature of the work. The copies can, moreover, be taken on a variety of substances, such as cardboard, china, and wood, as easily and clearly as upon paper, the reproduction being so excellent as to be scarcely distinguishable from the original. One notable characteristic of the process is that when one operation is completed it is not necessary to remove the transfer from the face of the composition by washing. Instead, the inventor has devised a chemical composition which, when applied to the surface, draws the ink through the mass to the bottom of the tray in which it is placed, leaving the copying surface smooth, clean, and unimpaired.

A NEW EXPLOSIVE.

Interest is being evinced by quarry-owners and others who have to resort to blasting operations in the new explosive that has recently been placed on the market. The recommendatory advantage of the compound is that it will only explode by detonation, thereby rendering it perfectly safe to handle under all conditions. In the preliminary tests at a quarry recently, although it readily exploded when detonated, hammering and other similar efforts failed to explode the mass, while it remained inert when a hot iron was plunged therein or when gunpowder was fired on it. Moreover, friction failed to produce any evil results. Under these circumstances it is becoming widely adopted for excavating stone by blasting, for which it appears to be eminently adapted, especially as explosion is not accompanied by the emission of poisonous fumes, while it can also be more cheaply produced than the majority of explosive agents in general use for such work.

'HODGSON'S.'

A booklet, printed for private circulation, entitled *One Hundred Years of Book Auctions, 1807-1907*, contains a brief record of the rise and progress of the firm of Hodgson & Company, the well-known London book auctioneers in Chancery Lane. The review marks the changes in book-collecting and bookselling over that period, and especially the rise in price of such works as the Shakespeare folios, many of which have found their way to America. Dr Dibdin in 1818, in referring to the sale by Mr Robert Saunders, the founder of Hodgson's, of a first folio for one hundred and twenty-one pounds sixteen shillings, remarked that this was the highest price ever given, or likely to be given, for a book, which not so long ago fetched three thousand six hundred pounds. Over the century Messrs Hodgson have held four thousand two hundred sales, and between 1849 and 1890 many thousands of pounds' worth of publishers' stocks, plant, and copyrights have been sold by the firm. One of the most important of these transactions was the sale at the London Coffee-House of the entire copyrights and stock of the novels of Sir Walter Scott, along with Lockhart's *Life*. This branch of the business seems to have been diverted into other channels, and now Messrs Hodgson deal on a large scale in rare, valuable, or standard books. An interesting chapter of the history of publishing and bibliography might be gleaned from the priced catalogues of Hodgson's trade sales at the Albion Tavern. In the early years of the century the hours of sale used to be 11 A.M. or 5.30 P.M.; now 1 P.M. is the regular hour.

AN INGENIOUS CALCULATING-MACHINE.

Since the first commercial mechanical calculating appliance was devised by an Englishman—the evolution of which, however, proved such a tax upon the inventor's brain that it drove him insane—other devices to the same end have since been evolved with more good fortune to their contrivers. One of the latest, most simple, and most efficient of these which we have seen is that perfected by a Glasgow inventor. Its most prominent feature is

its extended range of usefulness, an object achieved without resort to complicated mechanism. Indeed, simplicity, combined with time and labour saving, is its keynote. It can be designed to meet the requirements of any trade, such as invoice-checking, calculating purely and simply, weights or measurements, quantities, multiplications, estimating, abstract of cost, payment of wages; in short, it is an admirable ready reckoner. It is a distinct acquisition to a busy commercial house or factory, and being so simple in its operation, a boy or girl can manipulate it with infallible accuracy, while at the same time it occupies but a very small space upon the office desk. It marks a new departure in mechanical clerical work, and its success may be gathered from the fact that it has been already adopted by several of the leading and largest Scottish commercial houses and manufactories.

RAILWAY TICKETS FROM OLD NEWSPAPERS.

This is essentially the age for the commercial utilisation of waste products; but the strangest development in this connection would appear to be that prevailing in Belgium. Upon the Government railway system newspapers left in the train are the property of the nation, to be used by it for the manufacture of railway tickets. The papers are carefully collected and sent to the head depôt, where they are pulped and a special variety of cardboard for ticket purposes is prepared. Some idea of the amount of raw material readily available to the railway authorities from this source may be gathered from the fact that the accumulation of discarded newspapers upon the whole network of railways aggregates about seven hundred pounds per day, representing over one hundred tons per annum.

NEW WOOD PRESERVATIVE.

The preservation of wood comprises one of the most economic questions of the day in certain industries, such as the manufacture of railway sleepers and paving blocks. Various processes have been devised for prolonging the durability of the material when exposed to the deteriorating influences of wind and weather or water, but few have survived the trying ordeal of practical application. For this reason creosote injection under pressure remains the most general method in vogue for preserving timber. Attention, however, has now been drawn to a new process that has been perfected, by means of which the wood is impregnated with a new coal-tar extract called 'injectol,' comprising a thin, dark-brown liquid of regular density, the viscosity of which varies very slightly under atmospheric changes. The wood to be treated is either soaked in the fluid or the latter is forced into the pores of the timber under pressure; and, owing to its fluidity, the antiseptic is capable of penetrating the heart of the wood more easily and quickly than creosote, while at the same time smaller quantities are required. To secure some comparative data concerning the preservative quality of 'injectol' as compared with the more generally adopted mediums, samples of timber treated with each were immersed in a tank containing a highly and rapidly decomposing solution, and permitted to remain there for several months. Upon withdrawal the wood treated with 'injectol' was found to be in a perfect condition, while the other samples dressed with creosote preserving-fluids were found to be extremely decayed, thereby showing that creosote is only capable of arresting decomposition for a short period. Owing to the success of the new extract, it is arousing the attention of railway authorities and others in trades in which extensive avail is made of timber.

NEWSPAPERS FROM PEAT.

The heavy demands that at present prevail for wood-pulp, more especially for newspapers, and the extensive denudation of the world's forests that has resulted in order to meet the requirements of the market, have urged inventors towards the discovery of some new source of raw material. Peat is regarded as a possible raw material for this purpose. The latest development in the production of peat-pulp is being made in Sweden, where a large factory has been built. The process adopted is of American origin. It is claimed that a ton of paper worth six pounds can be produced from peat at a total cost of three pounds, so that an ample margin of profit is available to render the enterprise financially practicable should the paper-pulp thus obtained compare favourably with that secured from timber, and be applicable to the same commercial requirements. The operations of the Swedish company are being closely followed, since in the event of its success efforts to utilise the huge expanses of peat-bogs in Scotland and Ireland would be carried into effect.

A NEW SHALLOW CONDUIT TRAMWAY.

A committee of the corporation of Edinburgh has recently been investigating the new shallow conduit system for tramways that has been perfected by a Birmingham inventor, the feature of which is a combination of the advantages of the overhead and conduit systems at a greatly reduced initial outlay. In this system the central slot or conduit in the centre of the road is abolished. Instead, the rail on the right-hand side of the driver is slotted, and on its under side is carried the conductor, consisting of a thick copper wire. Current is collected by means of a small trolley carriage placed between the wheels of the car. It is claimed that not only is such a system cheaper to lay down—the outlay being about a thousand pounds per mile—but disorganisation of traffic by water collecting in the conduit is prevented. It would seem, however, that the greatest objection to the system would be the liability of the tram-rails to become electrically charged, thereby offering a grave danger to pedestrians and vehicular traffic, while a break in the wire would necessitate tearing up the road, which,

in view of the principles of the system, might possibly be of frequent occurrence.

A NOVEL STRANDING-BUOY FOR SHIPWRECKS.

Although our facilities for succouring wrecked vessels, as represented by the rocket apparatus and the lifeboat, have been brought to a high standard of perfection, yet there are instances from time to time when these systems are unavailable, owing to the inclemency of the weather or the situation of the wreck. This fact was strikingly exemplified in the cases of the *Hilda* near St Malo and the *Berlin* off the Hook of Holland. These disasters emphasised the necessity of devising some other means of establishing communication between ship and shore. The fact that in such catastrophes the wind and sea have always been raging shorewards suggested to Mr Bredsdorff, a director of the Flensburg Shipbuilding Company, after the *Berlin* calamity, an apparatus which should be carried by the vessel itself, and which, in the event of a wreck, could be easily and quickly launched, and under the combined agency of the wind and sea be carried towards the beach. For this purpose he has contrived an ingenious 'stranding-buoy.' In design it resembles a small boat, three feet in length by eighteen inches broad, and twelve inches deep, drawing eight inches of water, and equipped with a small mast and sail. The device is built of metal, with a rounded deck, and has a heavy lead keel, which, tapering at either end, maintains the buoy in an upright position no matter how rough the sea, and which, even if it should be capsized with the sail up, is sufficient to enable the buoy to regain its equilibrium. The apparatus is divided into three watertight compartments, in which can be stowed the ship's papers or any other communication which the captain may desire to be conveyed. Attached to the stern of the buoy is a light manilla rope, which upon the launch of the device is paid out from a reel, there being one thousand five hundred feet of rope in the coil. When the buoy is dropped overboard it is caught by the wind and rapidly driven ashore, means being provided to keep the sail always to the wind, and when stranded it can be easily secured by people on the beach by means of a boat-hook. In this manner a light line is established between the land and the ship, and a heavier cable capable of carrying the rocket life-saving apparatus can be hauled either from the ship to the land or *vice versâ*. The possibilities of such a novel device will be instantly realised. In the case of the *Berlin* wreck—which was too far away from the land to enable the rocket apparatus to be of any service, while the surf was too heavy to enable the lifeboat to be launched immediately intimation of the wreck was received—communication between the ship and the shore could have been quickly and easily established by the Bredsdorff apparatus, and possibly the whole of the passengers saved. It has also many other potentialities which should recommend its adoption in maritime circles. Occupying but small space, it can be easily secured to the bulwarks of the captain's bridge, and launched instantly by merely cutting the lashings with a knife. By its means many of the mysterious disappearances of vessels in mid-ocean could be cleared up, as when such a calamity occurs the captain would only have to insert a notification of the circumstances in one of the watertight compartments, and then cut the buoy adrift. Owing to its size, sail, and brightly polished surface, it would be a conspicuous object upon the sea during the day, and would be quickly recovered by some passing vessel; while during the night, owing to the ringing of a small bell carried at the top of the mast, its presence in the vicinity of a ship would be betrayed to the lookout. Moreover, in an emergency it can be used as a lifebuoy, since there are four grips fitted to its sides for such purposes and it is sufficiently buoyant to maintain three persons afloat, while provisions and water can be carried in its watertight compartments.

PRESERVATION BY PASTILLES.

In the December number, under the title 'Tabloid Refrigerating Agents,' a mistake was inadvertently made in describing the process as one of refrigeration. It is rather a means of *preservation*, since the edibles to be safeguarded have their surfaces impregnated with sterilising fumes arising from the combustion of a patent carbon pastille in the air-tight chamber. The scope of the idea, which is already in extensive vogue on the Continent, is to afford a cheaper, handier, and more hygienic method of protecting perishable and delicate food-stuffs than that afforded by ice, the fumes which constitute the sterilising agent exercising no deleterious effects whatever upon the meat, vegetables, liquids, &c.

A NEW AND NOVEL SAFETY WINDOW.

For years the necessity of devising some improvement upon the conventional system of hanging and fastening windows, dispensing with the dangerous sash-lines, heavy weights, and the crude, unsafe type of fastener, has been realised. Any superseding type, however, to secure success must be equally simple, and an invention complying with this indispensable requirement, and far safer, has been devised by a London inventor. The whole of the working apparatus is contained in a small box which is so made as to be applicable to the ordinary type of window if desired by simply cutting away a small portion of the frame to admit of its insertion. The mechanism is of substantial construction, and there is nothing liable to derangement. By its means a window can be opened to any desired extent, and is automatically locked in that position, so that should a window be left open for ventilation during the night it is impossible to effect a burglarious entry. Moreover, the act of pushing up the bottom sash lowers the top section a corresponding distance; while, to facilitate cleaning, the top sash can be pulled right down to displace the lower one.

A ROMANCE OF ORD.

CHAPTER VII.

'MR CONRAD to see you, miss.'

Katie, who had been crouching on her knees before the study-fire, started to her feet at the words and turned a flushed, amazed face towards the door. It was only yesterday that the new tenant had taken up his quarters at Ord. What could possibly have brought him to the manse in this unconventional and precipitate haste?

But the sight of the bashful figure hesitating in the doorway behind Kirstie's ample shoulders helped her to recover herself, and with a few simple words of welcome she stepped forward.

'My father is out,' she said; 'but I am expecting him every moment.'

Mr Conrad grasped her proffered hand eagerly, his wistful eyes seeming to devour her face at the same time.

Katie thought she had never seen such mournful eyes in any human face before; the shadow of a great loneliness seemed to lurk in their depths, a haunting conviction of solitude such as may often be seen in the eyes of those accustomed to gaze perpetually on the vaster mysteries of nature. But his first words banished any thought of sympathy, and recalled her abruptly to herself.

'My, if you ain't poor Diarmid's living image!' he exclaimed in a low, awe-stricken voice, dropping her hand at the same time and turning away as if the likeness had been too much for his feelings.

Katie gasped, unable to speak for a moment or two. Then her courage returned, and she said faintly, 'Diarmid—my brother! You know him?'

Mr Conrad faced slowly round again. 'Know him!' he echoed in the same subdued tones. 'Yes, and the man who killed him too—and'—— But the sudden pallor that had overspread his listener's face made him break off abruptly.

'Didn't you know he was dead?' he ejaculated hoarsely the next moment, as Katie staggered towards the mantel and stood clutching it, her blue eyes, dilated with horror and incredulity, fastened upon his face. 'Has Martin Ellis been living here at your very door all this time and never told you? But there, I might have known;' and he smote one hand into the other. 'Blundering cuss that I am!'

Strangely enough, the mention of the Laird's name restored Katie's self-control. With a flash of intuition she realised that she was on the threshold of some discovery that would explain, if it did not justify, his former conduct; and through all the shock and horror of her personal grief the desire to vindicate him made itself felt.

Signing to her visitor to seat himself, she herself groped towards the nearest chair.

'Mr Ellis has told us nothing,' she began at last in a low, difficult voice that to her own ears sounded strangely distant and far away. 'We have not heard from or of my brother since he left home. We might have guessed something had happened to him.' She paused. Not a doubt of the truth of Mr Conrad's story had assailed her. From the first she had accepted the tragedy in its entirety, and, with a courage that was part of her inheritance, had faced it in the same unflinching spirit. 'But what has the Laird to do with my brother?' she added the next moment. 'They never knew each other.'

It was Mr Conrad's turn to gasp; then he recovered himself. 'No; you are right—they never knew each other,' he acknowledged, and paused.

But Katie was not to be so easily put off. 'Tell me the truth,' she said, leaning suddenly forward; and there was something in the expression of her eyes that made evasion or prevarication impossible.

So he told her. 'Martin Ellis shot your brother,' he said; 'not wilfully, but in self-defence.'

She uttered no sound, only pressed one hand over her eyes. The horror of the revelation seemed to stun her for the moment; but subconsciously her brain was working all the time, readjusting her life into focus with this new and calamitous revelation that had suddenly come upon her.

Could she go on living, knowing the truth? Could she go on loving, knowing that the man she loved was her brother's murderer? Could she have married him—had he himself proved faithful—knowing what she now knew?

Quick as lightning the questions followed each other through her brain, to be met with the same unequivocal response in each case. The Laird was innocent. She loved him. His instrumentality in her brother's death could make no difference to her. There was no thought even of forgiveness in her mind. All the morbid complexities and shrinkings that would have assailed many women in the same position were entirely absent from her considerations. Yet her loyalty to her brother was unimpeachable; her grief for his loss was as deep and irreparable as theirs could have been.

'Tell me all,' she said presently, lowering her hand and facing her visitor with calm, tearless expectancy.

Mr Conrad glanced uneasily from left to right. He had been accustomed to meeting stoical women in his rough Western existence; but this girl's composure was of a very different order. It worked upon his sympathies as no mere callous indifference would have had power to do, and made him long to escape from the necessity of inflicting further pain upon her. But in the face of her steadfast courage it would not do for him to flinch; so, with a sigh, he took up his story.

'It was at Alaska, in a mining camp—Travellers' Gulch, they called it—that it happened,' he began. 'Ellis and his friend Usgood were supposed to have struck a claim and made a haul. They had just come, too, and there were a lot of us fellows there who had been prospecting for months and never sighted gold; your brother was among them. Well, one night he and his pal Grainger determined to find out the truth, and they stole into Ellis's tent to see what they could discover. Ellis woke up suddenly, and, thinking they meant mischief, he drew his revolver and covered the foremost of them, who happened to be Diarmid. Grainger, seeing the flash of the barrel, believed his pal was in danger, and fired. At the same instant Ellis took aim—the shot that killed your brother. It was all in the dark, remember; nobody was really to blame. Grainger's charge had gone into Ellis's leg, and the next instant he swooned away.

'He is lame still,' interrupted Katie between white lips.

Mr Conrad nodded. 'That's true,' he agreed. 'Well, he was ill for a long time, and when he recovered poor Diarmid had been buried for some weeks. So, in a manner of speaking, they never really met or saw each other—which is, of course, the reason why Ellis has kept silence all this time,' he continued with a sudden illuminating flash of inspiration, starting to his feet at the same time and commencing to pace restlessly to and fro. 'He doesn't know, poor chap! and I've wronged him.'

'But the name!' interrupted Katie quickly.

Mr Conrad gave a faint smile. 'We don't put much faith in surnames in a mining camp,' he said, unconsciously adopting Usgood's very words in reminding the Laird of the same circumstance. 'Your brother was known as David Brown in Alaska. It was only when I had left the Gulch for some weeks, taking his papers with me, that I discovered his real name. There was a letter among them from your father. But somehow, hard as I tried, I hadn't the heart to sit down and tell the old man of his son's death, as I should have done. But I resolved that if ever I had a chance of coming to this country, Ord would be my first stopping-place, and so it has been. Last year I struck a claim and made my pile, and here I am. It will be something of a surprise to Ellis when he discovers that the Mr Conrad who has taken Ord from him is the Jimmy Barnes of Alaska,' he added with a dry little laugh.

Katie started. 'Then he doesn't know yet who you are?' she queried sharply.

The visitor shook his head. 'I did all the business with his solicitors,' he said. 'And now I wish I'd left the whole thing alone,' he went on in a tone of sad reproach, 'bringing this trouble upon you. But I naturally believed Ellis would have made a clean breast of it at once. It, somehow, never entered my calculations that he might fail to recognise you. Now, if it had been his pal Usgood the secret would have been out at once,' he concluded, turning and continuing his restless walk as he finished.

Katie started to her feet. 'Usgood!' she echoed in a bewildered tone. 'But he has been here.'

'And met you?' queried her visitor, turning sharp round and facing her.

She nodded.

'Then it's all up!' he ejaculated. 'If John Usgood saw you he knows, and if he knows you may be pretty certain Ellis knows too; so we are back at the starting-point again, and no nearer the truth than we were,' he added with a little sigh of perplexity.

But the last part of his sentence was lost upon his listener. Bit by bit the detached fragments of the mystery that had so long troubled her were piecing themselves together in her mind, and as she realised the truth a strange sense of thankfulness mingled with the first anguish of her grief. Mr Usgood's recognition of her at Ord, Ellis's interrupted declaration in the garden, his sudden and inexplicable flight the next morning—of course she saw it all clearly now. In the interval Usgood had told him of his discovery, and for very shame he had made his escape. How could he face her knowing that he had her brother's blood upon his hands? A wave of pity for the suffering he must have endured swept over her, in which the memory of her own months of bitter shame was lost for ever.

It is necessary to be in such extremity as hers to realise how the stricken spirit turns about for any gleam of comfort to which to cling. Fate had dealt her a cruel blow with one hand; but with the other it had restored her pride, her self-respect, and, better than either, her faith in the man she loved.

She was still absorbed in these conflicting emotions, when the sound of wheels on the drive outside recalled her abruptly to the present. Unconsciously her face whitened. 'It is my father,' she said in a low voice, casting a little involuntary glance at her guest as she spoke.

Mr Conrad met the glance with eager solicitude.

'Let me tell him,' he said, starting forward, his face flushing awkwardly.

But Katie with a resolute gesture waved him aside. 'No,' she said; 'wait here. There may be questions he would like to ask you;' and before he could signify his submission to her commands she had left the room, closing the door behind her.

CHAPTER VIII.

SOME time later the minister tapped at his daughter's door, and in response to her muffled summons entered the room. To Katie's eyes he had a strange aspect of loneliness as he came towards her, emphasised by the expression of pathetic fortitude on his face and in his whole bearing.

A sudden conviction of guilt and disloyalty smote her with the realisation. For him the sorrow that had come to them was unrelieved by any redeeming circumstances; while for her—— How else could she explain that inarticulate yet undeniable sense of relief and thankfulness that made itself felt through all the poignant consciousness of her loss? But was it disloyal to find solace in the re-establishment of her own self-respect? she asked herself. That was all it meant, this twofold discovery she had made. Her grief was none the less in consequence, only the removal of the reproach upon her womanhood helped her to be strong in enduring it. But the minister had no idea of the diverse emotions that were mingled with the central fact of her sorrow in his daughter's mind, and set himself to comfort her with the simple alleviation of mutual grief. For some time they talked in hushed voices of the one who had been dead to them in reality for so long, their memories—sharpened by the certainty of their loss—reviving old tales and incidents of his past, till by degrees an actual reflex of his personality seemed to invade the room.

It was not till these reminiscences were exhausted that any allusion was made to the author of the tragedy.

The minister was the first to introduce Ellis's name. He had risen from the low couch on which they had seated themselves, and crossing to the window, stood gazing out over the drab November landscape for a moment or two without speaking. Suddenly he murmured something, and as she caught the words Katie's heart gave a leap within her.

'Poor Ellis!' the murmur came again, more distinctly this time. 'We must think of him! We must think of him!'

Katie held her breath, hardly daring to believe she heard aright. If her father could take this merciful view of the case, her own leniency had not been so misplaced as she had imagined.

But he was speaking again.

'It is almost worse for him than for us,' the low voice went on. 'We must make it up to him somehow. It won't do for him to be driven away from his duty by fear of us and our reproaches, eh, Katie?' and he turned suddenly round and faced the girl, his voice grown vigorous all at once, a challenging light in his blue eyes.

But Katie made no answer. She had lowered her head at the question, anxious to hide the expression of glad relief that, she knew, must be betrayed on her face; and, try as she might, she could not bring herself to utter a word.

The minister watched her for some moments in disappointed silence; then, crossing over, he laid his long brown fingers on her arm. 'What's this, Katie?' he said, reproach and tenderness struggling for the mastery in his voice. 'Surely you are not going to show an ungenerous spirit, my girl! The thing was an accident, and he has suffered enough, be sure of that.'

Still Katie remained silent. Her head went lower and lower. Every word of her father's made her sense of reproach the keener; yet how could she show him the extent of her gratitude without also revealing its true cause? And this was no time for such a confession. 'I am sure he has suffered,' she faltered at last, though without looking up; 'and I am sorry for him.'

The minister gave a quick sigh of relief, straightening his shoulders involuntarily at the same time. 'Ah, that is spoken like my own brave girl!' he said, moving over to the window once more and stationing himself in his old position with his back to her.

Katie's eyes followed him reverently. Hitherto her belief in his goodness had been more or less a matter of instinct; now in this crisis she saw the true essence of the man proved and attested beyond doubt. There was a long silence.

At last the minister turned, and with sudden resolution moved towards the door.

Katie half-started up to follow him.

But at the sound of the movement he paused. 'I was thinking of dropping Ellis a line,' he said in a hurried, somewhat embarrassed voice, 'to tell him—that we know. Is there any message you would care to send him?' and he glanced tentatively at the girl as he spoke.

Katie was silent for a moment; then, flinging back her head, 'Tell him to come back to Ord,' she said in a low, clear voice. 'Tell him that his duty lies here.'

The minister's only answer was a grave smile as he passed on to the door.

The next days were filled with alternating suspense and anxiety for Katie. What reply would Ellis make to her father's letter? The generosity that had prompted him in writing it must surely find some response as high and deserving of admiration in its recipient. But day after day passed, and no letter came to turn her hopeful premonitions into certainty. She could see that the minister was as anxious as herself on the matter, though he said no word of his feelings. The eagerness with which he opened the post-bag morning by morning, and the little shadow of disappointment that fell on his face as he turned over its contents, told their own tale and filled her with anger and bitterness against Ellis. All else she had forgiven him. But this slight to her father, coming as it did just in the moment when he was most in need of comfort and support, hurt her beyond the telling.

At last, when the silence had continued for a fortnight, the minister made his first and only allusion to the subject. 'We are not to have an answer, Katie,' he said, raising his head from examining the address on the one meagre envelope the morning's post had brought. 'Well, he knows his own business best; and at all events he can't blame us for keeping him from his duty;' and he drew in his chair to the table and prepared,

with a pathetic display of unconcern, to open his correspondence. Katie shot a glance of almost passionate tenderness across the table at the white, bowed head and the face that had grown so pitifully thin and transparent-looking lately; but she said no word, and the meal was concluded in silence.

Then followed a period of reaction that to the girl, on looking back, always seemed the blackest and most hopeless epoch of her life. Everything was in accordance with her mood. The very weather was of the dreariest: long days of dismal rain alternated by wild gusty winds that cried in the chimneys and swept around the manse, shaking the walls to their foundations; gray skies and a grayer atmosphere. Little wonder was it that Katie languished and drooped.

It was Mr Conrad who first drew the minister's attention to her condition. He had become a constant visitor at the manse since that first tragic afternoon, and it was wonderful how quickly and unobtrusively he had adapted himself to the life of the house. Neither Katie nor her father realised fully their dependence at this time on his quiet comings and goings and the kindly sympathy and interest he was always ready to extend to everything that concerned them.

As his first shyness wore off, too, he proved himself a conversationalist of no mean order, and many a dull evening he enlivened for the lonely pair by his tales and anecdotes of the wild, adventurous existence that lay behind him.

It was on the conclusion of one of these informal evening visits, when Katie had retired to bed, leaving the two men for a last smoke, that he voiced his warning concerning the state of her health. The minister was at first inclined to deride the idea. But Mr Conrad stood his ground. 'Forgive my interference, padre,' he said earnestly; 'but in a manner of speaking I feel responsible. It was I that brought the trouble on her, and I'd do any mortal thing to help her over it. I was wondering if perhaps it was a question of money,' he went on, reddening awkwardly as he spoke—'if a small loan would convenience you. I've far more than enough for myself, and it would be an honour to do anything for Miss Katie.'

The minister glanced sharply over at him as he finished speaking. Katie's father was not an observant man as a rule; but there had been an unmistakable something in the tone of his visitor's voice as he said the last words that aroused his suspicions. Mr Conrad was gazing into the fire evidently unconscious of his scrutiny. Yes, he was afraid he was right. What a change had come over the man since his first appearance at Ord! The lonely, haunted look had vanished from his face; his whole aspect was sprucer, more civilised, less uncouth than formerly. Really, as he sat there in his dark, well-cut clothes, he was quite a personable-looking fellow; and what a heart!—as good as gold. Rich, too; there was no doubt about that.

The minister closed his eyes for a minute trying to face the situation. Mr Conrad was not the kind of son-in-law he had pictured for himself; but Katie might do worse, and he could feel very safe about her in the care of such a man.

A glow almost of excitement at his own astuteness warmed his veins. He would say nothing to either of them; but in a judicious way he would take some opportunity of sounding Katie as to her feelings. Then came the remembrance of what had led to the revelation. If he took Katie away just now he might be interfering with the course of the affair. But Mr Conrad wished it; it was his suggestion. Doubtless he would follow them, and in due season propose. By that time Katie would have seen something of other men. Yes, it was the best plan in the world.

'My dear fellow, I can't thank you enough,' the minister cried; 'but happily there will be no occasion for me to borrow from you. I have some money put by for such an emergency as this, enough to pay for a substitute too. It will do both of us good to get away for a time. And, who knows, you may be coming south yourself?' he added with elaborate indifference.

Mr Conrad's eyes gleamed. 'I shall make a point of following you wherever you go,' he said. 'I am not going to lose sight of the first friends the old country has given me.'

'Then it's settled,' said the minister. 'I wonder what Katie will say,' he added under his breath.

It was the day before the date fixed for their departure. Katie had proved malleable; and though she exhibited no elation at the prospect of leaving Ord, neither had she raised any objections to the idea. To-day, for the first time, an unreasoning regret assailed her, and, donning her outer things, she determined to try to walk it off. The weather had changed during the last few weeks, and a brilliant frost succeeded the preceding gloom.

Instinctively her feet turned in the direction of the glen, following the path she had so often trodden in company with the Laird. Never had the claim of his personality been stronger than upon this afternoon. It seemed to her as if his very presence was visualised before her; all the more attractive traits and aspects of his character reproduced themselves in her imagination: the subtle glamour of his manhood, his chivalry, his strength and courage. At last, tired with her wanderings, she sat down on a slab of granite by the rude stone dike that intersected the moor at this point.

The sun was already sinking behind the distant shoulder of Ben Gerrick; a soft, mellow haze hung over the wide spaces about her. No sound broke the stillness save the bleat of a sheep in some distant corrie or the mournful crying of a curlew overhead.

Lulled by the restfulness around her, Katie leant

her head against a projecting stone in the dike and resigned herself to her thoughts.

All at once she sat up with a start and looked about her. Somebody was coming towards her across the moor: a tall tweed-clad figure sharply outlined against the faint glow of sunset in the western sky; somebody with a strangely familiar lameness in his gait, a little rebellious jerk of the shoulder, that made Katie start to her feet in a sudden panic. It was the Laird—or his wraith. For a brief instant she believed she was dreaming; then, as realisation came to her, she glanced hurriedly round as if for flight. She must escape somehow, somewhere. But where? On one side was the wall effectually barring her progress, in front the trackless moor. No, there was nothing for it; she must stand her ground. With cold certainty she came to the decision.

Now he had seen her, and now he had recognised her; she could tell that by the sudden halt he made and the equally sudden forward movement again.

Oh, would that interminable distance between them never be covered? Now they were near enough to read each other's eyes, each to note the set pallor of the other's face.

Now his cap was off his head. He was standing in front of her.

'I have just come from the manse.' To Katie his voice sounded distant and far away, as from the summit of one of the surrounding hills. 'They tell me you are going away to-morrow.'

'Yes,' from Katie. Then, with a sudden, uncontrollable impulse of anger, 'Why did you not answer my father's letter?'

He started. 'I have had no letter from your father.'

'No letter! Then you don't know—that we know about'—— But she could get no further.

'You mean about your brother?' The Laird's voice was very low.

'Yes.'

A long silence.

'I had come to tell you that to-day,' he said. 'I have been in America ever since, looking for the man who had the proofs of his identity.'

Katie gave a little dry laugh. 'And all the time he has been at Ord!' she said.

Ellis laughed too, but with mingled anger and derision. 'Ord is let to a man called Conrad.'

'He was Jimmy Barnes in America,' said Katie.

'My God!' from the Laird. 'And it was from him that you heard—— Then it is true.'

Katie nodded.

Another long silence.

'Now I know why your father wrote to me,' said Ellis very bitterly at last.

But Katie silenced him. 'You are wrong,' she flamed. 'He wrote to offer you his forgiveness—to ask you to come back to Ord.'

Ellis's head was bent. As he stood there Katie noticed with a pang how gray the lock of smooth hair on his forehead had become, how lined and haggard his face. At last he raised his head.

'That was like your father,' he said. 'But you need have no fear. I am not going to take advantage of his goodness. I only returned to tell him the truth. I am going away at once.'

'Then you are a coward and weak!' cried Katie indignantly almost before she was aware.

His face hardened; a steely gleam came into his eyes. 'You have the right to taunt me,' he said. 'I have no defence.'

His words brought the hot tears smarting to her eyes. But she winked them resolutely away.

'I shouldn't have said it, but it's true,' she persisted. 'Can't you see that you are wrong—that your duty lies here? See, the land claims you'—and she waved her hand expressively from right to left—'the land and the people—and you would run away!'

The Laird was silent for a moment, his eyes fixed on her glowing face. At last he spoke. 'You condemn me to a harder punishment,' he said. 'But you are right. I will stay.'

Katie thrust out her hand impulsively. 'Thank you,' she cried.

He stared at it dumbly. 'Your hand!' he said. 'And I the cause of your brother's death!'

She stamped her foot. 'Oh Laird,' she said, 'as if that could make any difference to me!'

'Katie!' he cried hoarsely, seizing her hand in both his. 'Katie, what do you mean?'

'The second chapter is going to commence,' she said.

THE END.

A WISH.

In the silence of the midnight,
'Neath the vastness of the skies,
In the softness of the starlight,
Let this soul of mine arise;
While my life-worn frame is sleeping,
And all-conscious, let me soar,
Let me rise above the darkness
To the Land of Evermore.

Let me soul to soul commingle
With the spirits of my kind,
Let my sleeping pulses tingle
With my ecstasy of mind,
Let the visions of my slumber
With my waking wish attune.
Let me sleep! Why re-encumber
This pent soul of mine so soon?

TONELLI'S GOLD.

By T. W. SPEIGHT.

IN FIVE CHAPTERS.—CHAPTER I.

ON a certain chilly October afternoon, when the clouds hung low and heavy and the London pavements were greasy after the morning's rain, Carlo Tonelli shut the door of his domicile behind him, and, after an indifferent glance up and down the mean street in which for years he had made his home, he bent his steps westward. He was carrying a small parcel containing a couple of Satsuma vases which he had bought the day before for a mere song from a person who was evidently hard up and was unaware of their value. It was Tonelli's belief—and he had some knowledge of such matters—that they were worth a good round sum, and he was on his way to the emporium of Signor Monti, the well-known art and curio dealer, in the hope of being able to strike a profitable bargain with that astute individual.

Tonelli was a man of sixty, but looked older than his age. A quarter of a century's close devotion to experimental chemistry had aged him prematurely. He was tall and lean, with a student's stoop of the shoulders. He had the long, thin face of an ascetic, but it was the face of one who in his time had been a remarkably handsome man. His outer garment this afternoon was a much-worn overcoat which reached nearly to his heels, while his plentiful white locks were crowned with a broad-brimmed hat of soft felt. He had come to London when comparatively a young man, and had remained there ever since. He spoke English as fluently as his native Italian, with only a just perceptible foreign accent.

He had concluded his business with Signor Monti to the satisfaction of both, and was on his way back through the lamp-lighted streets, when he came to a sudden stand, arrested by the sight of a young man who was staring intently into a jeweller's window. For several seconds his own stare at the other was just as intent.

'*Davvero?*' he exclaimed under his breath. '*E possibile?*'

Advancing a step or two, he peered more closely into the other's face. Then, laying a hand on his shoulder, he said in English, 'Stefano Santi, what hast thou been doing all these years since we parted last?'

The young man thus addressed turned swiftly, as a man might who was liable to be suddenly arrested. He gave a great gasp and his lips trembled visibly in the light from the window.

'It can't be that thou hast forgotten thy old uncle Carlo Tonelli!' exclaimed the elder man. 'At any rate, I have not forgotten my sister's son.' With that he proffered his hand, which the other grasped cordially enough.

'The surprise was so sudden and complete,' said Santi, 'that for the moment I was taken aback. But I've not forgotten you, Uncle Carlo; no, indeed, nor your kindness to me when I was thrown homeless on the world.'

'That was ten long years ago. *Oime!* how time flies!'

'And how is my cousin Amata?'

'Come home with me and see for thyself. Thou wilt find that she has not forgotten thee.' With that he linked an arm in one of his nephew's, and continued on his way. An agreeable notion of some sort seemed to have struck him, for more than once he chuckled softly and said under his breath, 'It may be that in Stefano I have found the man I have so long been looking for.'

When they had reached a quieter part of the town Tonelli said, 'And now, tell me what thou hast been doing all these years. At our parting thou wast about to go to Paris as a waiter at one of the big hotels, a situation which a friend of thy late father had obtained for thee.'

'That is so. As a waiter I stayed in Paris for three years. At the end of that time a rich English *nobile*, a bachelor, took a fancy to me and engaged

[*All Rights Reserved.*]

me as his body-servant, and with him I travelled half over the world. Unfortunately, he died at Gastein a few weeks ago, and—well, and here I am.' He ended with a short laugh.

His uncle had listened attentively. 'Thou speakest French, of course—and perhaps German?' he queried a little eagerly.

'Both. Not, of course, as well as I do English, but enough for all ordinary purposes.'

Again Tonelli chuckled softly to himself.

There was one inaccuracy in Santi's statement to his uncle. The nobleman in whose service he had been had died, not a few weeks, but three years before.

He was an exceedingly handsome man of six-and-twenty, with that style of good looks which we are accustomed to associate with his race and country. He had a clear, dusky complexion, and his small moustache and short beard were carefully trimmed. In his large, velvety black eyes there lurked a certain shifty cunning, which, however, the majority of people, not being physiognomists, failed to detect; but on occasion he could endue them with an expression of amorous languishment which, from the time he was a youth of seventeen, had caused many a soft and foolish heart to flutter uneasily. His clothes were of good material and fashionable make, but were frayed and shabby from long usage. With an Italian's love of colour, he was wearing a loosely knotted tie of pink silk, while his soft gray hat was worn with a peculiar rakish air, which, if nothing else had done so, would have marked him out as an alien. His uncle, glancing at him now and again with penetrative eyes, told himself that Stefano had all the appearance of a man who was hard up. Well, should such prove to be the case, so much the better for the purpose he (Tonelli) had in view.

'Art and Curio Dealer' was the announcement over the door of Carlo Tonelli's shop, which was situated a couple of streets away from the heart of the Italian colony in Clerkenwell. Passers-by who stopped to peer through the dingy bow window beheld a miscellaneous collection of articles which to the majority of them doubtless seemed little better than so much rubbish. There was a tray of dirty-looking coins of various ages and various countries, with a smaller tray of medals close by. There were a number of hideous idols of china or bronze, interspersed with vases large and small whose chief merit seemed to be their extreme ugliness. Here were focussed a number of quaint and strange articles collected by sundry travellers and seafarers from the aboriginal tribes of various parts of the world. In singular juxtaposition, a couple of Red Indian scalps—grim trophies!—hung between a coloured caricature by Gilray and another by Rowlandson. A stuffed alligator, five feet long, was suspended from the ceiling.

The opening of the shop door by Tonelli set a bell tinkling, and a moment later a young woman appeared out of the inner room. It was Amata, the old Italian's daughter. He had wedded somewhat late in life, and she was his only child. He had now been a widower for several years.

'Here I am back again, *mia cara*,' he said as he entered, 'and I've brought somebody with me; but I'll leave thee to find out for thyself who it is.'

Santi had followed close on his heels, and the elder man now stepped aside, leaving the other full in the gaslight. Amata turned her deep, steadfast gaze upon him. As she looked a rich colour swiftly overspread her face. There was a brief silence; then she said, 'You are my cousin Stefano Santi.'

Tonelli's laugh rang out. 'Did I not tell thee, *giovanetto*, that she had not forgotten thee?' he exclaimed.

'And you, of course, are my cousin Amata,' responded Santi. 'But most certainly I should not have recognised you again, so grown, so changed are you.'

They adjourned to the inner room, where dinner was in readiness. Another plate was laid, and they all sat down.

During the progress of the meal Stefano could hardly keep his eyes off his cousin. As he had said, he would not have known her again. When last he saw her she was a sallow-complexioned girl of ten, with high cheek-bones, long thin arms and legs, a generally weedy appearance, and a mop of hair which flattery alone could truthfully have designated as other than red. Now, in her twentieth year, she was in the full bloom of the opulent beauty into which she had gradually developed. In the course of his travels abroad Santi had seen many beautiful women of different nationalities, but few who, to his thinking, were as beautiful as Amata. Her complexion had the pure, creamy pallor of perfect health. The pupils of her large hazel eyes, over-arched by finely curved but somewhat heavy brows, when she was at all animated became flecked with minute specks of iridescent flame. Her wealth of hair had modified the crudity of its original tint, and was now of that exquisite Venetian red which the bygone painters of her country have known how to immortalise on their undying canvases. In her gait and bearing there was a certain untutored stateliness which formed a part of her birthright. She had already been sought in marriage by more than one of her countrymen, but so far she had turned a deaf ear to the pleadings of love.

In her dark-blue frock, with her snowy collar and cuffs, her coquettish little apron of sprigged muslin, and crowned with the heavy coils of her glorious hair, she made a seductive picture as she sat at the table and attended to the needs of her father and her cousin. She was fully conscious of Stefano's admiring glances, but she was so used to the admiration of the opposite sex that they affected her less than they might otherwise have done; for all that, she was genuinely glad that her cousin should seem to find her so attractive. There was much gay chatter over the meal, and rarely had Amata seen her father so animated as he was this evening. He

pledged his nephew's health in a glass of chianti, and made a feeling allusion to the young man's mother, who had been his favourite sister. At length he said, 'And now, while Amata clears away, thou must come upstairs with me. I have a certain proposition to put to thee.'

Carrying a lighted lamp in his right hand, and with a box of cigars tucked under his left arm, he led the way to the upper floor.

CHAPTER II.

CARLO TONELLI conducted Santi to a commodious room over the shop, in a corner of which an iron bedstead for one person formed an inconspicuous object. The old man motioned his nephew to a chair by a round table near the window, and, after placing his lamp on a bracket, himself took the opposite one. Two minutes later each of them was exhaling a spiral of pale-blue smoke.

Tonelli sat for a little while as if lost in thought. Presently, fixing his deep-set eyes on Santi, he said, 'I take it that thou hast no engagement at present?'

'None of any kind.'

'And if an easy way of earning fifty—nay, perhaps a hundred—pounds were pointed out to thee, thou wouldst not turn up thy nose at it, eh?'

Santi stiffened himself on a sudden. 'Only show me the way, and I shall be very glad to earn five pounds, much less fifty,' he said with a grimace.

Again the elder man became absorbed in thought. At length he spoke, first laying on the table his half-smoked cigar. 'When I was a lad of eighteen I entered the service of Professor Pazzi of Padua. He was indeed a very learned man. He believed in the existence of what is, or used to be, termed "The Philosopher's Stone"—that is to say, in a substance or any amalgam by means of which the baser metals can be transmuted into pure gold. For many years he conducted his experiments in secret, with me alone for his confidant. Unfortunately, he died just as he seemed on the eve of discovering the great secret. After that I came to London and set up in business with the money my dear master had left me. But it was not till I had lost my wife, years later, and my life felt very lonely, that I took to experimenting on my own account, following so far as my knowledge, which is considerable, goes in the professor's footsteps. From that day to this I have never ceased experimenting; indeed, I might almost say that my life has been given up to it.' He paused.

'And at last, where the professor failed, you have succeeded!' said Santi with unmistakable eagerness. Part of his uncle's statement had gone over his head, but the gist of the matter was clear enough to him.

Tonelli smiled a little wistfully. 'Not quite that; but I have gone a considerable way towards it,' he said. 'Listen. But first I will relight my cigar. *Oime!* I am an old man, and I have decided to waste no more of the little time left me in further experiments, but to stop at the point I have reached, and turn to account what I know already. In so doing I want thy help, *caro mio*. Again listen. I have mastered the secret of converting a coin compounded of base metal into gold; but the misfortune of it is that it only remains such for a short time, after which it gradually reverts to its original composition and becomes again the base substance it was at the first.'

Santi stared across at him, an unlighted cigar between his fingers. It seemed clear that his uncle's brain was beginning to give way. After a pause he said, 'And in what way do you want me to help you?'

'That I will presently explain to thee.'

Crossing to an escritoire, he opened it, dipped his hand into it, and, going back, emptied a small bag of sovereigns on the table. 'Behold a few samples of Carlo Tonelli's gold!' he said with a deep chuckle. 'Pick up any one of them and examine it closely. Is it not the very coin itself? Look at the milling. Each is the exact weight of the genuine article. Thou mayst test it—or all of them—with the most powerful acids, and they will leave no trace. Anywhere they will be accepted as real sovereigns—at banks, at hotels, at railway stations, at the money-changer's—anywhere, anywhere. To prove it to thee, we will presently go out, and I will change several of them at different places. For three months they will continue to pass current unsuspected by anybody; but at the end of that time they will begin to lose colour and brightness, and the loss will go on till they become once more what they were before I put them into my magic bath.'

'Your magic bath!' exclaimed Santi, feeling more sure than ever that his uncle's brain was softening.

'My cauldron, then, in which they are boiled for eighteen hours at a uniform heat, after which they come out as you see the specimens on the table. Somewhere is the hidden chemical which, if added to those already in use by me, would transmute into gold that would remain such for ever the coins of which the currency is now limited to three short months. In his search for that unknown agent my dear professor spent years of his life, and I have done the same. But some day it will be found—not by me, but by another. Ah, what a revolution—the greatest the world has ever known—it will cause!'

Santi was becoming still more puzzled. 'Then, of course, you have all the appliances for coining on the premises,' he remarked.

'Not at all. The coins are supplied to me by two of my countrymen, and very clever workmen they are. Of course I have to pay a good price for them. For what purpose I want them is no business of theirs, and they are too sensible to ask questions.'

'But where do I come in in this queer business?' queried Santi, who had a wide acquaintance with English slang.

'It will be thy business to put into circulation the coins I shall supply thee with.'

'Oh!' exclaimed the other; and he stared blankly at his uncle.

'There will be no danger—none whatever. Rather will it be a pleasant holiday for thee, for thou wilt be dressed like a gentleman, thou wilt have money to spend, and thou wilt put up at first-class hotels. Suppose that in the first instance thou goest to Paris, taking with thee a thousand of my sovereigns. In the course of a week or ten days thou wilt have no difficulty in changing them into their equivalent value in French notes, less the money-changers' percentage. Money-changers, I am told, are plentiful in Paris, and nobody objects to English sovereigns. Back in London, thou must change the French notes for English ones. About that there will be no difficulty. After Paris, thou shalt try thy luck in Brussels. Other big cities will follow. Oh, it's a grand scheme, I tell thee!' His eyes shone like those of a man in a fever, and his hands shook as he put back the coins into the bag.

Santi was still doubtful as to his relative's sanity. After a longish pause he said, 'Your scheme may be a grand one, uncle; but in what way should I benefit by agreeing to act as your agent in the affair?'

'Out of each hundred pounds' worth of English notes brought back by thee there would be fifteen pounds for thyself. In other words, for every thousand of my sovereigns got rid of thou wouldst pocket one hundred and fifty pounds.'

It was a big temptation to a man in Santi's position who was untroubled by moral scruples.

'But such a scheme could not be in operation for many months without resulting in a big "bu'st-up." When once the sovereigns began to change colour'——

Tonelli laid a lean forefinger against his nose. 'And thinkest thou thy old uncle has not considered all that? Tut-tut! Before the first lot of sovereigns put into circulation has had time to change colour I shall leave London for ever, taking with me English notes to the amount of six or seven thousand pounds. I shall go back to my native Sorrento, where I hope to lay my bones. There I shall buy a little villa and a vineyard. There Amata will keep house for me as she does here. And why shouldst thou not go with us to Sorrento, Stefano *mio*? Amata would make thee a good wife—none better; and it should not take thee long to win her heart, for she likes thee already.'

At these words Santi's cheeks flushed as they had not done for years, and the light of passion flamed suddenly in his eyes. He drew a deep breath, but did not speak.

'Think over all that I have said to thee,' resumed his uncle. 'Sleep on it, and come to me to-morrow afternoon. And now we will go out together, and thou shalt watch me get rid of four or five of my beautiful sovereigns at different places in exchange for small purchases.'

(To be continued.)

LETTERS OF A BELOVED PHYSICIAN.

IT is long since a critic said that of all the John Browns, commend him to Dr John Brown the physician, the man of genius, the humorist, the student of men, women, and dogs. Now, some twenty-five years after he has passed away, we are enabled to view him as a letter-writer. Messrs A. & C. Black have published *Letters of Dr John Brown, with Letters from Ruskin, Thackeray, and Others*, edited by his son and the Rev. D. W. Forrest, D.D. The biographical introductions are by Elizabeth T. M'Laren, whose booklet, *Dr John Brown and his Sister Isabella*, drew from Mark Twain this encomium: 'He was the most extensive slaveholder of his time, and the kindest, and yet he died without setting one of his bondmen free.' They will be less free than ever after reading these letters. And Dr Oliver Wendell Holmes, who knew him only through his writings, said of the same tribute: 'The life itself is so angelically sweet, the nature which won the love of the English and American reading-world showed itself so beautifully in his daily life, that no portrait-painter who pictures life in words could ask a more captivating subject.' Professor Masson tells us that as he saw Dr Brown about 1846, in Edinburgh, when in his thirty-sixth year, with some little practice as a physician, he was a dark-haired, stoutish man, of much shorter stature than his father, the Rev. Dr John Brown, with fine, soft eyes, spirited movement, and very benignant manner. In later life he developed into the placid, bald-headed, blue-spectacled veteran that many folks remember.

Some expressions of Dr Brown fit his own writings: they are 'done to the quick,' or 'the style was the man;' 'Good writing, like good breeding, comes from keeping good company.' In an appreciative article in the *North British Review*, Dr Brown was amongst the first to hail the dawning genius of John Ruskin in his then anonymous *Modern Painters*. He heralded, too, the rising star of Thackeray, and prompted the presentation in 1848 of a silver statuette of 'Mr Punch' to the novelist, defrayed by eighty half-crowns collected from friends, amongst whom were Lord Jeffrey and Sir William Hamilton. Thackeray thanked the donors who had been 'good enough to find out in Edin-

burgh that under the mask satirical there walks about a sentimental gentleman who means not unkindly to any mortal person.' And no doubt John Brown heartily agreed with him in this closing sentiment in one of his letters regarding literary pre-eminence: 'What, after all, does it matter who is first or third in such a twopenny race? Kindness matters, and love, and good-will, and doing your duty if you can.' Ruskin and Thackeray, Lady Trevelyan, and many others valued very highly the friendship of John Brown, as these letters, with their record of social intercourse, amply bear out.

His great-grandfather, the Rev. John Brown of Haddington, author of the *Self-Interpreting Bible*, Dr John Brown styles 'Our King, the Founder of our Dynasty.' Miss M'Laren writes of him as that 'shepherd boy on the braes of Abernethy, whose father and mother died before he was eleven. He taught himself Greek and much else. One evening, asking a companion to take charge of his sheep, he set out on a midnight journey to St Andrews, twenty-four miles distant. His purpose was to buy a Greek Testament. The bookseller to whose shop he went the next morning was inclined to smile at his request, but a professor, coming in at the time, asked the lad some questions, and finally told him that if he could read a passage from the Testament he should have the book for nothing. He did so, and this Testament is now in the possession of his great-great-grandson.' The Haddington patriarch's son, the next John Brown, of Whitburn, Linlithgowshire, was a devoted country minister there for fifty years. Then the next in order, his son, Dr Brown of Broughton Place, Edinburgh, was for fifty-two years a minister—for sixteen years at Biggar in Lanarkshire, thirty-six years in Edinburgh; and for twenty-four years was one of the Professors of Theology in the United Presbyterian Church. The beloved physician of whom we write was the second child, but eldest son, of this greatly revered preacher and theologian. The atmosphere of his home and birthplace, with a rare and sympathetic memorial of his father, will be found in the son's 'Letter to John Cairns, D.D.' It was rather awkwardly so titled because the material came too late for the biographer; but we may be thankful that this memorial was kept intact and not chopped up and pieced into the Life. John Ruskin met his future friend for the first time at Wallington, Northumberland, then the home of Sir Walter and Lady Trevelyan. In walks and talks with the young Edinburgh doctor on the moors around Wallington it gradually dawned upon Ruskin the manner of man he was. Ruskin says: 'This the reader capable of learning at all (there are few men who can understand a good Scotchman of the old classic breed) had better learn, straightway, from the record he gave of his own father's life.' Jowett was equally appreciative of the memorial: 'I don't think I know of any piece of religious biography which I liked nearly so well or which showed the same feeling of genius.'

The future author left the quiet town of Biggar when twelve years of age, was sent to the Edinburgh High School and afterwards to the University, and, adopting the profession of medicine, was apprenticed to Professor Syme. It was an experience as Syme's assistant, in December 1830, in the old Minto House Hospital, which stood in what is now Chambers Street, which he wove into that delightful tale *Rab and his Friends*. In 1831 he went as assistant to a Scottish doctor at Chatham, and the home letters during the two years he was an exile show how hungry he was for communications, detail expenses, and breathe an affectionate spirit. There was a visitation of cholera; and although he makes light of his own share in fighting the epidemic, he acted with real heroism, while cowardice was shown by others. Dickens at a dinner-party in Edinburgh told how a young Scottish doctor during the Chatham cholera epidemic had remained with a poor stricken woman 'whom all had deserted, and then, overcome with fatigue, falling asleep, and being still asleep when in the morning the house was entered.' One of the party said, 'That was Dr John Brown.' On returning to Edinburgh in 1833 he began to practise, and married a very beautiful and charming young lady; and it was from 23 Rutland Street, where he died in 1882, aged seventy-two, that most of his delightful letters were dated.

It was Hugh Miller, geologist and journalist, who tempted Brown to write for the press by enclosing twenty pounds and asking for notices of the pictures in the Academy Exhibition. The notices were written with rare felicity and insight. His friend Dr Hanna also encouraged him to write for the *North British Review*, of which he was then editor. His practice increased, and his acquaintances included all who were in any way distinguished in Edinburgh society. Three children were born between 1841 and 1846, two daughters and a son; the second daughter died in infancy. In 1847 he was made a fellow of the Royal College of Physicians, and for some time he acted as its librarian. Occasional letters and paragraphs in the *Scotsman* were stamped by individuality and never failed to interest, while he was on terms of intimacy with J. R. Findlay and Alexander Russel of that newspaper. Thackeray came to Edinburgh in 1851 to deliver his lectures on the 'English Humorists,' and in 1856 returned to give his 'Four Georges,' and on both occasions Dr Brown saw a good deal of him, and the friendship and admiration were mutual. 'The great man has come, and *is* a great man as well as a writer. He is in fact greater as a man than as a writer, and he is big as well as great, six feet two, and built largely, with a big, happy, shrewd head.' Dr Brown also said Thackeray 'delivered us from Mary Queen of Scots, and Bruce, and haggis, and Burns, and Auld Reekie, and Hugh Miller. He took the whole house by the heart and held them; they were still and serious, and broke out wildly at the end.' The publication in 1858 of the first series of *Horæ Subsecivæ* made

John Brown famous, containing as it did the ever-popular *Rab and his Friends*. Two more series followed; the last he facetiously dubbed 'Potted Head' from the miscellaneous nature of its contents. The papers which laid strongest hold on the public, besides 'Rab and his Friends,' were the 'Letter to John Cairns, D.D.,' 'Pet Marjorie,' 'Queen Mary's Child Garden,' and 'Jeems the Doorkeeper.' And no saner or wiser advice was ever given in simpler language to common people than in his 'Plain Words on Health.' In his writing and his practice as a medical man he was an apologist for the good old virtues of common-sense, practical clear-sightedness, 'and vigorous rule of thumb,' and he was essentially anti-speculative. He had an unusual apprehension of all that was good and admirable in character and life. His love for the lower animals was well known. '*Rab and his Friends* and *Our Dogs* have been read,' says Professor Masson, 'by perhaps three millions of the English population of the earth; the very children of our Board schools know the story of Rab and his friends. Who could have told the story like Dr John Brown? Little wonder that it had taken rank as his masterpiece, and that he was so commonly spoken of while he was alive as The Author of *Rab and his Friends*. It was by that story, and by those other papers that might be associated with it as also masterly in their different varieties, as all equally "done to the quick," that his name would live. Yes, many long years hence, when you and I and all of us are gone, I can imagine that a little volume will be in circulation containing "Rab and his Friends" and "Our Dogs."'

An American publisher entitled his collected works *Spare Hours;* in the Tauchnitz edition a volume is named *Rab and his Friends*. Mrs Fields, wife of his American publisher, in 1860 called on Dr Brown at 23 Rutland Street. After the visit, with its interesting talk, Brown admitted that he had not been so happy for many a day. In a letter to Mrs Fields he said: 'I am quite sorry I cannot give you the manuscript of *Rab*. Only three days ago I found it in my desk, and threw it into the waste-basket, and by this time it is in ashes and up the chimney.' There must have been another manuscript, as we have handled one, which had these unprinted lines at the close: 'I have in my head a human and a dog moral, if thought advisable, but I prefer every one being his or her own moralist.—J. B.' In all likelihood this was the manuscript recently bought in a London saleroom by Quaritch for forty pounds.

The origin of *Rab and his Friends* was as follows. Dr Brown had been invited by his uncle, the Rev. Dr Smith of Biggar, to lecture there. He had never lectured before, and was puzzled as to what to give. The old incident of the carrier and his wife often came to his mind; he tried to set it down, in vain at first. At last, after returning from a happy dinner, he sat down on a midsummer night at twelve, and arose at four A.M., and 'slunk off to bed satisfied and cold. I don't think I made almost any changes in it. I read it to the Biggar folk in the schoolhouse, very frightened, and felt I was reading it ill.' When it was published the Biggar folk liked it better, and it did a great deal for his growing reputation. The real name of the Howgate carrier was not James Noble, but James Jackson; and his wife was not Ailie Graeme, but Tod; and there are other purely imaginative touches.

John Ruskin calls Dr Brown 'the best and truest friend of all my life: best for me because he was of my father's race and native town, truest because he knew always how to help us both, and never made any mistake in doing so.' His advice to Ruskin was, 'Don't over-cerebrate.' He was to take porridge and cream, and sleep eight hours out of the twenty-four. This corresponds to what Brown wrote to his father: 'It is quite certain that by concentrating in your brain the nervous energy for the purpose of thinking out a vast, complicated, and severe subject, and then committing it in the fewest and strongest words to the smallest piece of paper, you by necessity withdraw nervous energy from the rest of the body, you render your digestion imperfect and your liver torpid, and all this reacts on the brain, and you have giddiness and disturbance of vision. Try by all means to diffuse this nervous energy, by being out of doors, by being idle, by talking, by being talked to, by sleeping.' And not long before his own death he wrote to Miss Molyneux: 'Now, take care of yourself, and try to pass eight hours of the twenty-four in deep sleep, and don't read, and above all don't feel too much, till you are as strong as a horse.'

Dr John Brown's *obiter dicta* in these letters are always piquant and interesting, whether the reader agree or not; he had strong likes and dislikes, with depth and simplicity of character, and originality. The strength of manhood and the tenderness of womanhood were united in the genial essayist. Here are a few extracts: He called W. E. Gladstone 'the biggest man of our party; but he is ignorant of human nature, and as old Lord Dunfermline said to me thirty years ago, "he is a monk."' Of Sir Walter Scott's novels he never tired, and after a series of readings he was lost in wonder and love. 'What a fine fellow Scott was!—as shrewd, as queer, as game, as warm-hearted, as Scotch as his terriers.' He read *David Copperfield* with admiration, wonder, and disgust. 'Dickens, so hard and exacting in his egoism, so self-centred, his falsetto pathos, his caricature run mad, and above all his conduct to his wife.' After *Little Dorrit*: 'Dickens is a child of genius, but only a child; he never progresses, never improves, never studies, never restrains.' George Eliot's *Daniel Deronda* he felt 'unwholesome, unhuman, and absurd, full of laborious cleverness and naughtiness.' Like Carlyle, he does not entirely admire Christopher North. There was 'a dash of Bosh in him, a hullaballoishness, and a sort of demoralised and demoralising sentimentality that at once took and disgusted me.' Macaulay is a

'timid, flat man, and not one of the immortals; he wants the salts of genius and fine intellect and pure principle.' The best things in Macaulay's *Memoir and Letters* to him were his intense domestic tenderness and affection. He seemed never to have been in love, and there was no symptom of religion. In Matthew Arnold he found a sinewy and delightful style, but 'the great Matthew looks at the universe —and for that part at God—through an eye-glass, one eye shut, and a supreme air.' Of Browning he wrote in 1876: 'I have been reading Browning largely and carefully. He is a very true and great poet, more of both than Tennyson is by a great way. There is a wonderful quantity of thought and feeling in him, and he is always himself, never aping any one; but still he is at times coarse and rough and difficult, and goes off into mere thinking—very hard and strong, but not poetry.' W. B. Robertson of Irvine was 'the gifted and the copious.' Dr John Ker, whose sermons Queen Victoria was wont to read, was a 'delightful, a benign, pure, happy intelligence, a sort of Domestic Sun.'

There are hints and brief references to happy holidays in Spain, the West Highlands, and elsewhere. Those who have read 'Minchmoor' or 'The Enterkin' feel the very atmosphere of these regions in company with the author. The lines on the Tummel at Moulinearn in the last series of *Horæ Subsecivæ* are a rapid, vivid, portraiture of that stream from its source in Loch Rannoch until it joins the Tay. R. L. Stevenson would have delighted in the whimsical letters to young folks. There were periods of depression and melancholy in Dr Brown's life; but these do not leave their impress in this volume, which contains so much that is true, lovely, and of good report.

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire, How England Saved Europe*, &c.

CHAPTER XII.—A NEW CAREER.

HIS natural inheritance thus came happily back to young Jack Lawrence, and he was now the heir to what was still a great fortune, even after madame had spent the French part of it. His uncle, however, was a practical man, with a wise sense that a young fellow needed a definite career to give purpose to his life. But what career would suit Jack? He was too old for the navy; he had no predilection for the army or the Church.

Fox, who took a generous, if careless, interest in his old friend's son, brought the question to an issue with characteristic shrewdness.

'What are you going to do with poor Lawrence's son?' he asked.

'I am puzzled,' said Robert Lawrence. 'He is too old for the navy, he does not care for the army, and apparently has not brains enough for the law. His teachers say that he is slow-witted.'

'Nonsense,' answered Fox. 'There are brains somewhere behind that square forehead he owes to his father, poor fellow; and he has his mother's honest eyes. He has survived the Frenchwoman and that scoundrel the major-domo. His dullness is only a mask. He knows French like his mother-tongue, and he must know more about French politics than half the men in the Foreign Office.'

'French politics!' said Robert Lawrence in wonder. 'He only knows the gutters of Paris.'

'Well, France is ruled to-day from the gutters of Paris, if we're to believe all Burke says. To-morrow its gamins will be its statesmen, and he knows *them* well, doesn't he? The Foreign Office,' Fox said with conviction, 'is the place for him. They hate me on the Treasury bench; but old Lord —— is a good fellow, and I will speak to him.'

When Fox took the trouble to interest himself in anything he was a force to be reckoned with, and in due course John Lawrence found himself sitting at a desk in the Foreign Office.

Meanwhile, great events in Paris, as the years crept on, were sending their vibrations round the world. An ancient monarchy was falling, and the crash threatened to shake all the thrones of Europe. France was passing through a terrible new birth, and no one knew in what aspect it would emerge from the process.

John had seen the States-General meet—the opening scene in the terrific drama of the Revolution. His boyish eyes had watched the stately procession in which so many figures were marching, all unconscious, towards a goal of which they little guessed. Since he had reached London had come the news of the capture of the Bastille, an event which was more than the fall of a fortress or even of a dynasty. It meant the overthrow of a political system. Next came the memorable Feast of Pikes, an event which mistook itself for an idyllic scene of peace. But this strange dove of peace had steel pikes for pinions!

Then followed the flight of the royal family; the return of Louis XVI., a prisoner, to his own capital; the emergence of the Commune; and the appearance of that still more alarming apparition, the Jacobin Club. By the end of 1791 perplexed Europe was full of strange fears. The Revolution was a menace to the world. How far might not this newly kindled conflagration spread!

At his desk in the Foreign Office, Jack Lawrence, whose business it was to translate and docket the

French despatches, watched the whole wild drama with kindling interest and with eyes which had learned insight from his contact with the crowds of Paris and his familiarity with the oratory of the pavements.

Then came a personal event which changed the current of his life and flung him into strange scenes and perils.

'Lawrence,' said Fox, as he met the lawyer at his club one night, 'there's a bit of news from Paris which ought to interest you. Madame has been arrested, and her head must sit very loosely just now on her pretty shoulders.'

'Madame arrested! What for?'

'Well, she has been sailing in very stormy waters, and some eddy of the political whirlpool has caught her dainty little pleasure-boat and capsized it. She is in either the Châtelet or the Abbaye.'

'And has that scamp Duclos been arrested too?'

'Oh, no! He is more cautious than madame. I suspect he always had relations with the wilder spirits of the Revolution, and he renounced madame after the English estate had slipped out of her hands. He is a member of the Jacobin Club, and it is fast becoming the supreme force in Paris. If madame is to lose her head, I imagine he will be quite willing to pull the string that lets the knife fall.'

Jack learned the news that night from his uncle's lips, and he broke out hurriedly with the question, 'But what about Denise?'

'The child ought to be safe,' said Robert Lawrence. 'They are not sending children to the guillotine.'

But the younger man knew enough to be sure that neither her youth nor her sex was any guarantee that Denise would be safe after her mother's arrest. Would M. Duclos protect her? Yes, as a tiger might protect a lamb. Denise was now a girl of fifteen, and in the madness of Paris what perils might not threaten her? Jack pictured her cast a homeless waif into the streets. What refuge was there for her?

As he thought of that slender figure, set lonely and unfriended in such perils, every nerve in his body thrilled with sudden purpose. He would go to her help, and he clenched his hand as though it grasped a sword! She came through the darkness of midnight to his door to save him from the Châtelet. He would face all risks to rescue her from what might well be worse perils than any which lay in the darkness of that dreaded prison-house.

Characters written with a certain ink on litmus-paper are invisible, but when exposed to heat they creep into vision and can be read; and the sudden fire of concern kindled by the news of Denise's peril acted on young Lawrence's memory in the same way. Things forgotten became luminous.

His mind ran quickly over the familiar scenes and figures of the French capital, and they came back to him with strange clearness. He felt he knew Paris once more with the intimacy of one of its gamins. He would find helpers amongst his old associates. Lepitre he doubted; Toulan he could perhaps trust. Then he thought of the Rat, and he smiled, in spite of the anxiety of his mood, as he pictured the ferret eyes, the pointed chin, of his old follower. He could bend him to his will at pleasure. The Rat, indeed, might be a better ally than men in great positions.

He told his uncle of his plans the next morning, and was bluntly pronounced by that sagacious lawyer a fool to entertain any such thought.

'You will risk,' he said with emphasis, 'your career and your life by going to Paris just now.'

'I do not see why I should risk either. I know my way about Paris as though I had been born there, and I think I know where to get help.'

'You will never get leave,' replied his uncle with confidence.

'I think I shall. Indeed, I can help the Foreign Office, for I know men and affairs in Paris better than the secret agents they now employ.'

'Help the Foreign Office!' cried his uncle with scorn. 'Why, you know only the gamins of Paris.'

'Yes, uncle; but France is just now borrowing its politics from its gamins. Their ideals are shaping French affairs, and *will* shape them.'

Robert Lawrence stared to hear Fox's words on his nephew's lips, and as he looked at him he realised that here was a will stronger than his own. Jack Lawrence was no longer a boy. He was a young fellow of twenty, with broad shoulders and grave face. The news from Paris had acted on him like a challenge. The dreamy look that usually sat on his countenance had vanished. There was power on his dark brow and purpose in his keen eyes.

The long-limbed figure, the square head set on the square shoulders, the resolved lines on the dark countenance, the frank eyes steady with purpose—his mother's eyes of honest blue—under the black brows, these were all the signs of a force of character he had never suspected his abstracted-looking nephew to possess.

Jack feared his aunt's opposition more than his uncle's, and he approached her with some adroitness.

'Aunt,' he said, 'if your little Chris had fallen into some black well and was at the point of being drowned, do you think I ought to jump in and rescue her?'

'John,' said his aunt, with an alarmed look round for her little girl, as though to be sure she had not been swallowed up in some deep pit, 'do not talk of such dreadful things. But if it *did* happen,' Mrs Lawrence added with a smile at her own alarm, 'why, of course you would save the little maiden.'

Then Jack expounded his parable. Denise was at that moment in urgent peril. He was the only friend she had. He must go to Paris to try to rescue her. As Mrs Lawrence listened her kindly eyes grew moist.

'Yes, John, madame deserves neither pity nor help. She is amongst her own people and has made

her own bed. But that brave child, with neither mother nor father, in that dreadful city'——

As Mrs Lawrence spoke all the mother awoke in her. 'Yes, John, you *ought* to go. But, oh, my dear, my dear!' she said—and here Mrs Lawrence's Spartan virtue dissolved in mere tears.

Young Lawrence interviewed his official chief that same day.

'I must go to Paris, sir,' he said briefly, 'and cannot say for how long I may be detained there, and I want you to give me leave of absence.'

Mr Herriott stared. Leave of absence asked by a junior officer, and in such accents of confidence, offended all his official instincts.

'Go to Paris! You cannot go, Mr Lawrence.'

'I must go, sir. I want, indeed, to be authorised to use the agents of the Office in Paris to carry out my plans;' and he briefly explained his object.

His chief smiled satirically.

'This is all very interesting; and you want to use your time and the machinery of the British Foreign Office to serve a private interest. Your request is at least ingenuous.'

'But I can make it a public service, sir. I know Paris better than any of the secret agents you employ. They mislead you constantly.'

'How do you know, Mr Lawrence?'

'The Paris despatches come to me for translation, and so I know all their blunders. I can give you a catalogue of them. They have never been right. They are all Royalists, and their wishes blind their judgment. M. Target is advising you now that the Moderates are certain to triumph over the extreme party. But he is wrong. The Mountain is crushing, and will crush, the Girondists.'

'This is interesting once more, Mr Lawrence; but, again, how do you know?'

'It is a revolution, sir, which is in progress; and history shows that in a revolution—in the earlier stages at all events—it is the extreme party which prevails. Besides, I know Paris, and know many of the men who are coming to the front.'

'You know, I understand, the Paris of the gutters.'

'Well, sir, the revolution on your own theory reflects the Paris of the gutters. It is to be interpreted from the gutters. M. Target tells you the Jacobin Club will be suppressed. I am confident it will overthrow all its rivals.'

'You are surprisingly confident on a great variety of topics, Mr Lawrence.'

'I am confident, sir, because I know. Our agents are not in touch with the right men.'

Here was one of the youngest members of his staff talking diplomacy with accents of quite absurd certainty; yet it was with a penetration which made his chief uncomfortable. At that moment the door opened and an attendant entered.

'Lord Granville asks for you, sir.'

Jack waited for nearly an hour until his chief returned. His face was flushed. He plainly had been dealing with some unpleasant business.

'Mr Lawrence,' he said, 'some of your views at all events are right. The intelligence just to hand is that the Jacobin Club has declared itself in permanent session. It is plainly seizing control of affairs. Our secret agents on the spot, it must be admitted, are blundering. Lord Granville has asked me to find some special agent—an unknown man for choice, so that he will escape suspicion, but one whom we can absolutely trust—and send him to Paris for an independent report on the present state of things there. You shall go. It's quite exceptional to employ so young a man on such a business; but, then, you know Paris as nobody else available knows it. You know, too, that side of its life which just now, when all the ordinary landmarks have disappeared, may help to interpret affairs there. The business of that poor girl is a matter of purely personal interest; but our agents shall help you in it, and you may help the Office by getting better information than we now receive.'

Jack took his instructions with a calmness that, somehow, increased his chief's respect for him. This young official, it was clear, had some gifts he had never yet been suspected of possessing.

(To be continued.)

A CITY OF ETHIOPIA.

PART I.

If we look with attention at a map of the universe, we shall find, diverging from that spot where the continents of Europe, Asia, and Africa meet, a number of vast areas of land all of which go to make up the formidable whole known as the Mohammedan world. Many of these countries are dowered with Nature's choicest gifts, yet in spite of this, and of their comparatively close proximity to the centre of civilisation, they have for many centuries succeeded in holding aloof from, and often actively opposing, the progress made by their occidental neighbours. The people who inhabit these lands might be compared to the lonely watchers in a lighthouse who behold through a telescope the festivities taking place on the far-distant shore. Intolerant pride and self-righteousness are the rocks on which their structure is reared; fanaticism is the turbulent sea which bars their passage.

The kaleidoscopic changes which from time to time sweep over other parts of the world, reducing prosperous cities to poverty and decay, and raising up mere hamlets to be great centres of commercial

activity, seem to ignore entirely this region; for hidden away in the uttermost parts of these countries lies many an ancient city, the commerce and prosperity of which are, in spite of the primitiveness of its usages, as assured now as ever they were. The manners, customs, and dress of the inhabitants would appear to have remained the same throughout the ages; and the clamour and turmoil of the great outside world, if it reaches their ears at all, only does so as a distant rumble from a far-off land with which they have nothing in common. In some instances civilisation has stretched out one of its great tentacles in the form of a railway from the coast; but even this has not always made any appreciable change. The histories of these places, if any history is known, are often replete with terrible tales of bloodshed and oppression, of rulers deposed and slain, and of others raised up in their places only in their turn to meet with violent ends.

One of the most isolated outposts of this great empire of fanaticism and retrogression is the ancient and populous city of Harar, which has been for many centuries the commercial centre of that lovely and fertile country which lies west of the Somali desert—the land of the Gallas—now forming part of the extensive dominions of the Christian Negus of Abyssinia.

No more convincing proof could be offered of the force and vitality of Islam than lies in the fact that the conquering Abyssinians, steeped as they are in barbarism and superstition, and fiercely intolerant of any missionaries who may come and try to supplant their own ancient form of Christianity, now maintain towards their Mussulman subjects an attitude of complete religious toleration.

The three hundred odd kilomètres of desert which lie between the coast and the fertile region are now bridged by the French railway from Djbouti, which goes almost to the foot of the great mountains which border the wilderness. The original intention was to carry the line on to Adis Ababa, Menelik's capital. However, the work stopped where it is nearly three years ago, and does not seem likely to go on. 'Want of funds,' some people say; but it is generally believed that political complications have a good deal to do with the matter. The terminus is at Diré Daowah, in the Dankali desert, a forlorn and wretched-looking spot which owes its being to the railway. A few tin shanties dumped down amongst the stunted thorn-trees, a long, straggling street of miserable hovels—the native village—and the description is complete. The heat is oppressive, the flies plentiful and industrious, whilst the dismal groaning of camels, long trains of which are constantly being loaded or unloaded, forms an almost continual refrain.

There is nothing to tempt the traveller to linger in this spot, so that it is with a feeling of relief that I find myself at dawn one morning superintending the saddling of mules and the packing of baggage. At last all is ready; and, accompanied by the three or four Abyssinian soldiers who have been provided for my escort and guidance, I start off in the direction of the mountains, determined to traverse before nightfall the forty kilomètres which lie between me and the town of Harar.

This refreshing hour lends even to the desert a certain beauty. A slight breeze is stirring; the sky is tinted with violet and gold; and the sun, which later on is to become so fierce a tyrant, is now smiling over the rim of the horizon, picking out the distant scrub in a golden filigree.

Ahead lie the mountains, and somewhere on the other side of those hazy peaks is our destination. The track winds its tortuous way between the foot-hills, and after crossing and recrossing the dry bed of a torrent, enters at last a deep gorge, and we find ourselves after a ride of two hours at the bottom of the mountains to be ascended.

Increasing signs of vegetation now appear. The trees are larger, the foliage is more vivid, and patches of grass show here and there. The desert is being left behind!

A road was built over these mountains by the railway company for the purpose of facilitating traffic between the terminus and Harar; but either the workmanship was bad, or it was built without due reference to the force of the elements during the rainy season; for it is already so dilapidated and washed away that it is scarcely safe to use it. Therefore we keep to the old track, which has the additional advantage of being shorter.

It is now that that truly wonderful animal the Abyssinian riding-mule shows what he is capable of. He carries me up some of the steepest places without turning a hair. Sharp, loose stones or fallen tree-trunks do not worry him in the least. It is just the same to him if a chasm yawns beneath him or he is on a broad, solid road. His sturdy little feet never slip.

We are now near the top, and the sides of the mountains are covered with vegetation. Most surprising of all is a species of stunted cedar which grows in great profusion. How strange it seems to be standing here amidst surroundings that almost suggest a temperate clime, whilst down there lies the burning waste which we only left this morning—the land where it 'never rains'!

The ascent has now become so steep that we have to dismount and lead our animals. Our exertions are soon rewarded, and we arrive panting on the top.

What a scene of beauty is here unfolded! It is the land of promise, and the ridge on which we stand might well have been the spot from which Moses beheld the inheritance of Israel, only that instead of the country being 'afar off' it is close, and rolls in green undulations up to our very feet. Behind us, deep down and far over the sinuous lines of foothills, stretches the gray sea of desert. In front is a lovely prospect of green hills and dales. Fields of maize and barley wave in the

valleys, and groups of horses, cattle, and sheep are to be seen grazing in the pastures. Here and there a winding line of foliage betokens the passage of an abundant stream of water, whilst clusters of neat-looking huts speak of peace and industry. The shining surface of a lake in the distance completes the picture.

Descending a short and easy slope, we now travel through this Arcadia. The sense of exhilaration is simply irresistible. We are nearly six thousand feet above the sea-level. The air is balmy and full of breezes, and the change of scenery from the desert seems almost magic. The new and varied nature of the passengers encountered forms another source of interest. Hitherto we have seen scarcely any one but the scowling Dankali nomads or the Somali camel-drivers. Now we meet Gallas, Hararis, and Abyssinians, the last being nearly always mounted and armed.

The different ways in which these people greet or fail to greet the European stranger form an amusing study. Some of the peasants accord me a cheerful salaam; others stand with outstretched palm and scowlingly demand backsheesh. Most of the Mohammedans, and a few of the Abyssinians as well, are particularly insulting; and as they pass me they cover the nostrils and mouth with a corner of their robe, thus signifying that they consider me to be something unclean!

About noon we reach the top of a rise from which we again see the lake, now quite close, winding about in the hollow of the hills from which it takes its shape. Here we are to rest and take refreshment; and, having reached the bottom of the slope, we off-saddle at the water's edge.

The fresh and simple beauty of this place is of an order well calculated to rejoice the heart of a wanderer from a temperate clime, especially if that wanderer has already been satiated with the florid and overpowering magnificence of tropical scenery. With the delicate tints of the verdure, the abundant wild flowers, the noble stretches of greensward, and the gleaming sheet of water girt by the emerald hills, the scene might have been laid in one of the lake districts of England. The flowing and picturesque robes of many of the natives, the wild forms of the half-naked peasants, and the quaint scriptural appearance of the beasts of burden—these details just add that touch of romance and orientalism which makes the scene so perfect and fascinating.

In some places the banks are steep, but on this side a perfect lawn slopes gently down to the water's edge. Quite a number of travellers are encamped or halted along here. White tents are dotted about, and horses and mules are cropping the short, sweet herbage. In the distance a string of camels can be seen sailing along with a dreamy, sinuous movement towards where the track ascends the slope. Some of these travellers have been journeying many days, for we are now on the main route which goes from the emperor's capital to Harar. That stately Arab, for instance, who is now bowing and genuflecting over his midday prayer, has been trading up to Adis Ababa, and those camels in front are probably loaded with the ivory he has brought down from the interior. If we could take a peep into that tent we might see his women, or possibly two or three little Soudanese slaves whom he has bought for the use of his own household. Yonder are half-a-dozen Galla women resting against the cruel loads of firewood they are taking to the market.

Presently an Abyssinian comes up. He is evidently a person of rank, for he is attended by half-a-dozen armed servants. He is habited in the national costume, consisting of close-fitting cotton garments and a folding mantle ornamented with a broad red stripe. Neither head-dress nor sandals are worn—probably in contradistinction to the Mohammedans. On his breast is a metal cross, together with a few pagan charms; and he carries in the way of arms a long sword curved almost into a semicircle, a revolver, and a belt containing a most prodigious number of cartridges. His colour is very dark, almost black, as is the case with most of the Abyssinians of the south, though his finely cut features plainly bear the stamp of his Semitic origin. He bows with the graceful ceremony peculiar to these people, and offers me his hand. Finding that I cannot speak Amharic, he tries me in Arabic, and we exchange a few remarks. He affects to be greatly delighted on hearing that I am an 'Ingleza,' and soon commences to question me about my affairs: Where have I come from? Where am I going? What is my business? &c.—supplementing the information he acquires by addressing occasional interrogations to the soldiers who accompany me. In due course he again bows profoundly and retires.

The most extravagant dreams of a naturalist could not conjure up anything like the scene of bird-life which this place presents. The surface of the lake is literally covered with wild-fowl, including many varieties of ducks and geese; whilst all along the shore there strut in pairs or in troops all sorts of gay-plumaged birds of the stork and crane varieties. Nor are any of these creatures in the least disturbed by the near presence of so many human beings. The ducks, many with broods of little ones, swim about as unconcernedly as those in the parks at home.

After resting for a couple of hours at this spot we resume our journey. The road now begins to give evidence of the enormous amount of traffic which daily passes along it. In some places it is broad and regular, in others split up into four or five tracks, whilst occasionally it runs between banks from ten to fifteen feet high, cuttings actually worn by the feet of the countless transport-animals which have traversed it.

The nearer we get to our destination the more numerous are the passengers we encounter. All

roads seem to lead to Harar, and everything serves to remind us that we are approaching what represents the metropolis of the country. Long trains of camels, horses, mules, or donkeys are either going to or coming from the great market-town; in the one case they are loaded with cotton goods, hardware, and other imports from civilisation, and in the other with coffee, skins, ivory, and other native products destined for the marts of Europe.

Sometimes we pass an Abyssinian lady riding astride, but nevertheless looking quite graceful, and attended by servants or slaves; or, again, we meet a couple of soldiers mounted on the excellent mules of the country, and armed with modern rifles and long scimitars. The horse is apparently very little used for riding in this district, the mountainous nature of the country rendering the mule more serviceable. These animals are trained, like the Boer ponies, to go at a comfortable pace known as the 'triple'—something between an amble and a trot; this they can keep up for long periods, covering great distances.

The sun is nearing the western horizon as we top the rise which brings us in sight of the town. At first I can see nothing of it; my attention is held by the general aspect. Again the scenery has changed, and we are looking down on a wild and rugged landscape. Huge mountains rise up on every side; minor ranges and valleys seem to run in all directions, regardless of the ordinary rules of topographical formation. Here and there a frowning cliff of solid rock stands out in defiance of the all-embracing verdure, the valleys are rich with cultivation, and the thatched roofs of villages show all along the foothills.

It is not until the eye has taken in all these details that I become aware of the presence of a great brown smudge which sweeps over the end of the long, winding hill-spur on which I am standing. This is the city of Harar. As we descend the hill the brown smudge appears like a great area of ruins, from the midst of which there rise three or four tall white buildings. Lower down yet, and the ruins begin to take the shape of flat-roofed houses, and the white buildings resolve themselves into the minarets of a mosque, an Abyssinian church, and a large castellated building which turns out to be the palace of the Ras or governor.

We are now in the midst of the coffee-gardens, and are able to observe the clever way in which the slopes are terraced and irrigated. I am reminded, however, by the soldiers that if we are to enter the city to-night we must hasten on, as the gates are closed at sunset.

Outside the walls is a large enclosure filled with huts; these are the barracks; and close by is an earthwork fortification mounting several fairly modern guns. We soon approach one of the gates, round which is grouped a miscellaneous throng of idlers; and, wending our way through these, we reach the entrance, where the soldiers on guard, having addressed a few questions to my escort, allow us to pass.

Oh, disenchantment! Any lingering hopes that I still entertain of beholding anything picturesque about the architecture now rapidly vanish. Most of the houses are flat-roofed structures of one story, built of sandstone and plastered with mud. The widest street does not appear to be more than four or five yards across, whilst most of them are so narrow that two horsemen can with difficulty pass each other. These thoroughfares wander around with a tortuousness and apparent aimlessness quite incredible, and frequently end in a *cul-de-sac;* they are indescribably filthy, and in places almost precipitous. Thousands of pariah dogs in various degrees of manginess and semi-starvation prowl about or lie in heaps on the dunghills which obstruct the thoroughfares. Lepers in all stages of their horrible disease stand begging at the street-corners and church-doors. Gone is the beautiful landscape! The vision is obstructed by ugly, staring walls, and the nostrils are assailed by foul odours. In place of the smiling and tranquil scene of nature adorned by the unobtrusive works of rural and primitive man, we are faced by the spectacle of unnaturally congested humanity, with all its attendant signs of poverty, disease, and squalor.

After wandering for some time through this maze, I arrive at the one and only hostelry in the place, which is kept by a Greek, and bears the title of Hôtel de Harar. It is but a ramshackle place at best, squeezed into a courtyard at the end of a lane which is if anything narrower and dirtier than the others. Nevertheless, the proprietor, with the characteristic resource of his race, has made the place, if not luxurious, at any rate clean and comfortable. And so, having partaken of a meal which is certainly better than I had looked for, I retire to rest, worn out by my long ride, and hoping that a closer acquaintance with the town will reveal something of interest to repay me for my journey.

(To be continued.)

THE MILITARY GUARDS OF LONDON.

By CHARLES WINDHAM.

FROM the days when it was a mere palisaded village, inhabited for the most part by people who dressed chiefly in a costume of skins and blue paint, military guards have always kept watch and ward over London. With the passage of centuries, however, these have changed considerably, both in their number and nature. Thus, the skin-clad, javelin-armed warriors who opposed Cæsar's advance gave place to Roman legions, and these latter to the troops brought over from Normandy in the train of William the Conqueror. It is their descendants who, as scarlet-coated British infantrymen with magazine-rifles, enable the citizens of London to sleep peacefully in their beds to-day.

From the fact that the majority of them are employed in barracks and other places to which the general public do not have access, the military guards mounted in London at the present date are not much in evidence. Sentry-duty, too, is becoming reduced every year, for a better use has been found for a soldier's time than spending it in tramping up and down a measured 'beat.' A hundred years or so ago, however, a very different order of things obtained, and sentries were posted all over the Metropolis for the purpose of discharging duties that would now be looked after by policemen or regarded as unnecessary. In the latter category, for example, would undoubtedly be included the functions of the two grenadiers who once attended the sisters known as 'the beautiful Gunnings.' These ladies, it may be mentioned, professing to find themselves embarrassed by the crowd when they walked in St James's Park, actually prevailed on the military authorities to detail a couple of Guardsmen to march in front of them and keep the other promenaders at a respectful distance. As may be imagined, the circumstance excited a good deal of comment in the press; and, so far from achieving their avowed object, the ladies thereby attracted an increased amount of public notice. It is very possible, however, that it was in the hope of this that the military escort had been applied for!

Other places where the services of sentries are now discontinued are the 'patent' theatres (excepting on gala occasions), although at one time they were always in evidence there. The practice existed in the reign of Queen Victoria; and whenever Her Majesty attended a performance a guard took up position outside the doors. Beyond enhancing the importance of the occasion, and perhaps impressing an admiring crowd, it is difficult to see what useful function was achieved by employing troops in this capacity.

Occasionally the military guards stationed at theatres early in the last century came into contact with the people waiting to catch a glimpse of Royalty. A notable instance of this occurred at Covent Garden. According to a newspaper report of the period, 'two young men of respectable appearance were indicted at the Westminster Sessions for having assaulted a private in the Third Regiment of Foot Guards in the execution of his duty at Covent Garden Theatre. The case excited a great deal of interest, much doubt having been entertained by several gentlemen at the Bar whether a soldier's duty comprehended his attendance at the theatre.' From the evidence submitted, it seems that while the sentry was on his beat outside the main entrance, 'the defendants, who appeared to be in liquor, came up to a girl and began to pull her about, by which some noise and disturbance was occasioned.' This, of course, was more than the chivalrous soul of the Guardsman could permit. Accordingly, he 'called upon them to go about their business; but they denied his right of interference, and refused to comply. The consequence was that a scuffle ensued, in which the soldier was roughly used. He denied that he had pointed his musket against them or used any other means of restoring quiet than fair words.' The defence resolved itself mainly into an acrimonious discussion between the gentlemen in wig and gown on either side as to whether employment at places of amusement was included in the routine of military duty or not. The presiding magistrate, however, soon removed any doubts on this subject in the mind of the prisoners' counsel, and the jury returned a verdict of guilty. A well-deserved fine of five pounds was inflicted in each case.

Among the different parts of the Metropolis where the public may still see military guards being mounted daily are Buckingham Palace (when the King is in residence), St James's Palace, the Tower, the Bank of England, Whitehall, and the Powder Magazine in Hyde Park. At St James's Palace and Whitehall the ceremony always attracts a large number of spectators. This is the case to a special degree at the first-named place, and is perhaps chiefly due to the fact that a band is in attendance. The parade, indeed, is quite one of the 'sights' of London, and, as it may be witnessed for nothing, is also extremely popular. This, by the way, is one of the three guards now posted in London that include officers in their composition. Of these there are three—a captain and two subalterns. At the Bank the command is vested in a subaltern.

The daily guard-mounting at St James's Palace takes place in Friar's Court every morning throughout the year (except when the King happens to be at Buckingham Palace), about 10.45 A.M. On the approach of the relieving troops, headed by their band, the old guard falls in under arms and awaits the arrival of the new-comers. As soon as these

make their appearance, an interchange of compliments is carried out, the colours saluted, the new sentries posted, and the quarters formally handed over by the officers in command. While all this is going on the band plays a selection in the courtyard. The proceedings are finally brought to a close by the musicians forming up afresh and marching back to barracks with the old guard. The 'pomp and circumstance' accompanying the ceremony acts as an excellent recruiting agency, and many a soldier's military career dates from the moment when he first witnessed a guard-mounting parade at St James's.

When the guard mounts at Buckingham Palace the ceremony is perhaps rather more elaborate. The procedure is as follows: The detachment on duty at St James's (which has also furnished sentries for Marlborough House, and at one time supplied them for the War Office) marches down, accompanied by the drums and fifes of the battalion detailed for the purpose. On arriving at the Palace it takes up position in the forecourt facing east, a few paces from the principal entrance to the quadrangle. The portion which has been on duty in the Palace falls in on the left, the drums and fifes on the right. The centre of the line is thus opposite the main gates. As soon as all is in readiness, the relieving guard, formed in four divisions, enters by the north entrance and comes to a halt in front of the old guard. The band accompanying the new arrivals occupies a position on the north flank, facing south. On the word from its commander, the new guard advances in slow time to within about fifteen paces of the line. It then halts and 'presents arms,' a compliment which is repeated by the old guard. During the time occupied in relieving the sentries and 'taking over' the guardroom, the band, which is stationed near the equerries' entrance to the Palace, plays a brief selection. When all the arrangements have been completed, the old guard returns to barracks again, slow time being observed until the forecourt is cleared. The detachment for St James's furnished by the new arrivals is then marched there by the drums and fifes, the Buckingham Palace portion proceeding to its own quarters.

For the Palace guard the smartest men in the battalion of the brigade detailed for duty are, of course, picked out. Some of the tallest men in the whole of the British army are to be found in what is known as the 'King's Company' of the First Grenadier Guards. The average height of its members is well over six feet, while other measurements are in proportion. At one time every corps had a 'Grenadier company,' to which were posted all the biggest men in the regiment. When Guards of Honour were required they were usually composed exclusively of these troops.

Although it is unaccompanied by a band, and only lasts a few minutes, the ceremony of changing the guard at Whitehall is an exceedingly popular one with Londoners. This is accounted for in a great measure, no doubt, by the fact that it is performed by the Household Cavalry. The uniforms and magnificent chargers of these troops come in for a great deal of admiration, and attract scores of those people who always seem to have plenty of time to witness anything in the nature of a show. The mounted sentries on either side of the entrance-gates also attract an embarrassing amount of attention on the part of the public, and when they are withdrawn at night anxious inquiries are often put to the dismounted men inside as to when they will reappear.

Under ordinary circumstances the care of the military buildings at Whitehall is left in the keeping of two corporals and twelve troopers. When, however, the Court is in residence additional men are supplied, and the command devolves upon an officer. He is permitted to leave his quarters for a stipulated period at night in order to dine at St James's Palace. This mess is also attended by the officers on duty at the Palace, and several guests are often present as well. The calls of duty, however, make the hosts leave early, and by eleven o'clock the assembly must disperse. The hospitable gathering in the mess-room was in bygone days not marked by the decorum that now obtains, and scenes of rather wild revelry sometimes occurred. In a set of old military drawings an artist of the period takes this circumstance for his subject. His treatment thereof, however, is in all probability highly imaginative. Some entertaining comments referring to these gatherings may also be found in a magazine article, purporting to describe an officer's life in London, that appeared about the year 1840. 'The Guards' dinners at St James's,' says the writer, 'are of ancient standing; and it is a shame that nowadays, when military men have betaken themselves to writing like their neighbours, none of their traditions have been given to the public. It is a thousand pities Miss Burney was not a Guardsman; the record of the mess would have furnished forth much more inspiring incidents than the Frau Schwellenberg's dinners to the equerries at which "dear little Fanny" presided, as vice-bedchamber woman. To Gilray are we indebted for the only peep into the *symposia* of the Guards at St James's with which the public has been favoured; and until some member of the corps takes up the pen to show that his predecessors could joke and sing to the purpose, the corps must be contented to be judged by that caricature.'

A peculiarity in connection with the guard which looks after the Bank of England at its headquarters in Threadneedle Street is that it is changed in the evening, instead of—as is the case with all others—in the morning. The sentries on duty at this institution are all posted within the building, so that no one but burglars and persons attempting to gain a forcible entry after business hours is likely to be aware of their presence. The knowledge that they are patrolling the vicinity of the strong-rooms, however, probably serves to keep evil-doers at a

respectful distance. At any rate, not even the most daring housebreaker has, so far, attempted to help himself to the Bank's property under cover of night.

The Bank guard is commanded by a subaltern. At one time he was allowed a guinea by the directors for each tour of duty performed. The custom, however, has been discontinued for some years past, and the duty has now to be undertaken as part of the ordinary routine of garrison life in the Metropolis. Still, the commander of the guard has little to complain of, for, in addition to being provided with comfortable quarters, he is served with a capital dinner, to which he has the privilege of inviting two guests. Persons accepting his hospitality, however, have to leave the premises by a certain hour. The non-commissioned officers and sentries formerly received pay from the Bank's funds for their services in reinforcing the civilian staff of custodians, but this practice no longer obtains.

Half-a-century ago the custom of providing an evening meal for the subaltern in charge inspired the following quaint remarks in a guide-book of the period:

'Dinner is supplied by the Bank for the officer on guard there and two friends. A plain, excellent dinner it is, brought in daily from one of the best taverns in the neighbourhood. The store which the guards set by this dinner—excellent though it be—speaks volumes for the *ennui* which broods over the period during which they are stationed at the Tower. . . . The cynosure of attraction to the weary sub on duty, the magnet which drew him to encounter this long and toilsome march, and, worse, the incarceration of four-and-twenty mortal hours within the walls of the Bank, was not the ingots piled within these walls—his high spirit disdained them; not the bright eyes of the City maid or dame—these must now be sought in the suburbs; it was the substantial fare of the City—the genuine roast-beef of Old England and the City's ancient port, far surpassing the French cookery and French wines of St James's. . . . But rich and substantial though the feast provided for the red-coated dragon who guarded the golden fruit of their Hesperides by the merchant princes of the Bank of England, its merits were heightened in the estimation of the young Guardsman by the circumstance under which it was eaten. . . . Engagements that might have looked commonplace elsewhere, and under other circumstances, were Elysium there and then. What a moment was that when, the hour of shutting the gates approaching, his visitors must leave him! The sweetest minute of the evening, he tasted it not in the bustle of leave-taking; but, like all sweets approached to the mouth and withdrawn untasted, it lived for ever unchanged in remembrance!'

The guard at the Tower has more than once been called upon to resist attempts to make away with the property committed to its care. The object of these has generally been the Crown jewels or the contents of the Armoury. A notable instance was one in which the infamous Colonel Blood was concerned. This was in the days of Charles II., and the arrangements were so carefully planned that they all but succeeded. The alertness of the sentries, however, prevented the actual completion of the theft.

About fifty years ago something like a reign of terror existed among the daily military guards at the Tower on account of the appearance of alleged 'ghosts' who were solemnly asserted to haunt certain portions of the buildings from midnight to dawn. Nothing could shake the garrison's belief in these supernatural visitations, and one of its members actually died from fright. At last things arrived at such a pitch that it became necessary to post double sentries on every beat. The 'ghosts,' however, still manifested themselves, and the authorities were practically at their wits'-end to calm the superstitious fears of the troops. Matters, indeed, had almost culminated in general refusal to go on duty, when the mystery was cleared up. It appeared that the spectres were the outcome of a stupid practical joke on the part of some young men who had studied the ghost-raising methods of the celebrated Professor Pepper, who was just then giving his entertainment at the Egyptian Hall. With the punishment of these would-be humorists the unwelcome manifestations promptly ceased.

The ceremony of delivering up the keys of the Tower is still carried out in the fashion that was first adopted centuries ago. A few minutes before the appointed hour the yeoman-porter, attended by a warder, comes to the main guardhouse. The sergeant in charge turns out with an escort, and the party proceeds to the Spur Gate. Each sentry passed challenges in turn, 'Who goes there?' and is answered, 'Keys.' After all the gates have been carefully locked, the little procession arrives once more at its starting-point. Again the sentry outside challenges, and as before is answered, 'Keys.' This time a more detailed explanation has, however, to be given. 'Whose keys?' is demanded. 'King Edward's keys,' answers the bearer. This is deemed satisfactory, for the reply is given, 'Advance, King Edward's keys, and all's well!' Thereupon the yeoman-porter exclaims, 'God bless King Edward!' to which every one responds, 'Amen!' The guard then presents arms as the key-bearer goes across the parade to deposit his charge at the office of the lieutenant of the Tower, and with this the ceremony is concluded.

The Royal Mint, which at one time had its offices in the Tower, and now adjoins it, was until quite recently also provided with a military guard. A year or two ago, however, it was decided that the premises could be looked after by policemen quite as well as by soldiers. As may be imagined, the latter made no complaint. The guard at the Powder Magazine in Hyde Park, however, is still continued. More than once the custodians of this institution have had rather an anxious time, for the place has been threatened by evil-disposed persons with the avowed intention of blowing it up. The

last occasion of this nature was when a party of desperadoes known as 'the Fenians' were displaying considerable activity in London. Fortunately, however, nothing came of their threats.

Guard-duty is not popular among soldiers. In proportion to the amount that has to be performed, a garrison is said by them to be 'easy' or the reverse. London is, according to barrack-room opinion, one of the latter, for the different guards (including those mounted regimentally) call for the employment of a large number of men daily. Yet in comparison with that required in Paris, Berlin, or St Petersburg it is insignificant. The tour of duty lasts for twenty-four hours at a time, throughout the whole of which period every one has to be very much on the *qui vive*. The actual time spent on sentry by each man, however, is only eight hours. This is divided into four spells of two hours, with a rest of four hours in between. As guardrooms are always furnished in a severely simple manner, the term 'rest' is a relative one. The only bed, for example, on which a soldier can recline when relieved from his beat consists of a sloping plank that occupies the entire length of one wall. He has to lie down, too, fully dressed, and his slumbers may be disturbed at any moment by the necessity of having to turn out for inspection by the field-officers of the day. This takes place twice during the tour of duty.

Sentry-go itself, although not particularly fatiguing, is decidedly monotonous—especially at night. It consists in little more than walking up and down a carefully defined 'beat' in a 'smart, soldier-like manner,' as the regulations put it. While thus employed a man may at any moment be called upon by the commander of the guard, or an officer detailed for the purpose, to 'give over his orders.' These, which have to be learned by heart, vary in number and nature with each post, and are printed on a board hung up in each sentry-box. Certain orders, however, are more or less common to all posts. Among such are those requiring the sentry to keep 'a vigilant eye' on Government property, and 'in the event of fire or disturbance to alarm the guard.' Notice has also to be given of 'the approach of armed parties,' in order that the proper compliments may be paid.

The greatest vigilance has to be observed on sentry, for on this often depends the safety of large bodies of men. Any dereliction in this respect is accordingly regarded as a most serious offence. In the old days, when a much more severe discipline was in force than is at present the case, a soldier found guilty of sleeping on or deserting his post would certainly have been shot. In connection with this there is a well-authenticated story of a sentry proving his innocence of such a charge in a novel fashion. The man in question, whose name was John Hatfield, was brought before a court-martial for being found asleep on his beat shortly after midnight when visited by a patrol. The evidence appeared conclusive, and the prisoner would undoubtedly have been convicted, when he set up the extraordinary plea that he must have been awake at the time in question, as he distinctly heard St Paul's clock strike thirteen instead of twelve. On the matter being investigated it was found that this had actually happened, and the accused was accordingly acquitted. Hatfield, it may be mentioned, remained in the army for many years afterwards, and died at the great age of one hundred and two. His trying experience, accordingly, could not have done him much harm.

Non-commissioned officers when on guard are never called upon to perform sentry-go. They are kept fairly busy, however, in posting reliefs and visiting the men on their beats, &c. This latter has to be attended to by the commander four times during his tour of duty. He is also held responsible for the safe custody of any prisoners committed to his care, as well as for all Government property in the guardroom. A detailed inventory of this latter is handed over from one commander to another. Any item therein that is not produced, or is found to be damaged, at this time has to be made good. Broken windows can generally be attributed without demur to 'violence of storm;' but when it comes to putting missing door-keys down to the same cause even the most easy-going of garrison quartermasters finds it time to protest.

A DAY OF MARCH.

My soul went singing, for I knew
That spring was close at hand,
Although a sounding tempest blew
Across the wintry land,
And rarely broke the sunshine through
The great clouds overspanned.

The keen wind swept the clouds along
In swift, stupendous march,
And angered past the oak-tree strong,
Or whistled through the larch:
Great Nature's organ to her song
In her infinite church.

About the northern slopes and dells
The sheeted show still lay,
For proof that winter yet had spells
To grudge that jocund day
When prisoned leaves should burst their shells
And flame to green from gray.

Then, in a sheltered copse, I heard
Some first sweet notes essayed
By an undaunted prophet-bird,
So blithe and undismayed,
That to loud song my being stirred,
And this the verse I made:

'Wild wind! beat with thy phantom wings
Against the doors of spring,
Thou shalt not dull the joy she brings
Nor cause long tarrying.
Listen! 'tis that this brave bird sings.
Harken! thou envious thing.'

MAGPIES IN A GARDEN.

By L. H. SOUTAR.

One's sorrow, two's mirth,
Three's a wedding, four's a birth,
Five's a christening, six a dearth,
Seven's heaven, eight is hell,
And nine's the deil's ain sel'.

THERE is a garden which was beloved of birds. I use the past tense discriminately, for by so doing I am stating the present condition of the state of mind of the feathered tribe as far as I can ascertain it.

Four years ago there were kept in captivity in a roomy aviary in the orchard situated at the foot of this garden two magpies, and in a smaller division of the cage dwelt a solitary sable-winged corbie. All were fierce gluttons and unlovable, and if they had not been the choice pets of a boy who had gone over the seas they would have regained their freedom cheaply; for his sake they were kept and fed, and visited with as much curiosity as one might visit captive ogres.

These birds lived to eat, and, oh! the cunning of them in their endeavours to add succulent morsels to their already generous fare. The magpies excelled themselves in devices to secure small birds, one of which was the raising of the wire netting at the foot of their enclosure, and laying down a sop of bread to lure in the confiding robins, sparrows, and chaffinches. These little birds at first cautiously hopped near to the tempting bait, took a peck, then hopped away, while the sly magpies, perched on the dead stump of a tree within their enclosure, regarded with apparent indifference the little intruders. Thus gaining confidence, the little birds became bolder, and finally, casting all fear away, they ventured into the cage. Quick as a flash of lightning the pies darted upon them, slew them, swallowed what they could of their victims, then buried the remainders in their larder for future consumption.

There was nothing attractive about this bird-trio excepting a peculiar whistle which the male magpie gave when he heard any one approaching his cage, and it was not to be wondered at that we received the news of the death of the 'sad presaging raven' without much emotion; but we *were* aghast when we learnt some days afterwards that one magpie had disappeared, all but its feathers. We could only conclude that the remaining bird held in secret more than the knowledge of the fate of its missing mate.

Spring-time came, and with it a solitary wild magpie to the garden. The beauty of plumage and droll inquisitiveness of these birds cannot fail to attract attention. With what quaint dancing gait they hop along the lawn, how gracefully they balance themselves on the topmost branches of swaying fir-trees, and with what lightning speed they dart across the landscape on foraging expeditions! The beauty of plumage and droll ways of this wild pie fascinated us, and we went into raptures over him and his wooing of the lonely ogre in the aviary. He was often to be seen in the garden during the summer and autumn, and we fed him and encouraged him to stay with us throughout the winter. So that when another spring came round, and the little birds were busy as usual building new homes, and were full of thoughts of domestic affairs, the stranger magpie desiring to take up his abode with us forsook his captive lady and sought out a free mate, and together they constructed an untidy, roomy, concave nest of rough twigs, fibrous roots, and turf on the high branches of an araucaria-tree some twenty yards distant from the dining-room window, the winter feeding-place. In this stronghold six pale-dirty-green-spotted eggs were laid, out of which came in due time six voracious chicks, who, with clamorous cries for food, spurred with new energy their marauding parents to plunder mercilessly the surrounding neighbourhood for the wherewith to fill their craws.

When I explain that this garden is rich in trees of all sorts and sizes my readers will understand how the bird-clans found it an ideal nesting-place. The upper terraces and the lower terraces are dotted over with bushy golden yews and tall, grave-looking,

[*All Rights Reserved.*]

closely clipped Irish yews. The grass walk has two double rows of similar sentinel-like trees, the long walks are lined with varieties of evergreens, and rhododendrons and bushy shrubs are met with in every corner, and cover the steep grass plot down to the edge of the water-lily pond, where the willows and birch-trees grow, and the water-hen nests among the reeds. There are holly-trees golden and silver and green, plane-trees golden and variegated of leaf, oaks of big leaf and oaks of small leaf, poplar oaks and golden oaks, beeches green and beeches purple, Scotch firs and silver firs, pine-trees, maples, araucarias, ash-trees, thorns of all varieties, cypress-trees, and more trees than I know, all with long botanical names, and all with homely names. The owner of this garden loves his trees and goes on planting, forgetting the saw that trees grow when one sleeps, and the result is that at the present time this garden is in reality a forest in miniature.

But to hie me back to the birds and the reason why their love for this arboretum is of the past tense.

You will note, good reader, that the first nest of the wild magpie couple was built three years ago, and every one was interested to hear of a magpies' nest so near to a dwelling. Alas that these bandits should have given us just cause to deplore their coming into this Eden of little birds! Three years ago the magpies' nest made the sixty-fourth we discovered in the garden. Among this number we did not include some demonstrative rooks, who, uninvited, at the garden-gates built a small rookery on tall beech-trees, and cawed, to our great distraction, night and day during the brooding season; nor yet were counted the nests of the bickering, fussy sparrows, who fought with the chattering starlings and house martins in the eaves, and who lost many an egg in their rowdy disputes for possession of building sites.

Among the nests counted was one built by a reckless pair of missel-thrushes. They plastered down their nest with seeming carelessness on an exposed branch of an araucaria-tree, some four feet from the ground and thirty yards from the magpies' castle. It was a rough structure of twigs, moss, and rags, held together with mud and lined with fibrous roots. In it in the early spring they brooded over reddish-white speckled eggs, and four little chicks were hatched. The loud, harsh screech of the parent birds was constantly heard, for the magpies watched them keenly, knowing where a dainty morsel lay hid. The missel-thrush is said to be an egg-robber, and perhaps on this account they recognised thieves and were more wary of their treasures and rarely left the neighbourhood of their nest during the time of incubation, and for the first few days after the chicks were hatched one or other of the parent birds constantly hovered near or sat closely on the nest. The nestlings would be about four or five days old when the harsh, churring cry of the thrushes warned us that a battle-royal was taking place. A cunning magpie found an opportunity to dart on to the nest and seize a hapless nestling. The two missel-thrushes pursued the robber, uttering loud, alarming cries of anger and anguish sufficiently harassing to have disconcerted the most callous-hearted bird in featherdom. The thrushes chased with whirling flight round and round the marauder, never actually striking him, but driving him with their persistent circling flight against the bole of a slender pine-tree. Twice the magpie struck the tree in his clumsy endeavours to get clear of the wrathful parents. At last, with wild screeches and flapping of wings, the thrushes drove the long-tailed bird of heavy flight with such force against the tree-trunk that he fell to the ground, and in so doing dropped a featherless, limp, clammy baby-thrush. Quickly the robber regained wing and rose clear of his pursuers, and flew far away beyond his own fortress, followed by the screaming missel-thrushes out of sight and out of hearing of us, who had watched the battle and saw the spoil lying dead at our feet. Often and loud were the alarms raised by this noisy family during the weeks that supervened, until time clad the remaining little ones in brown coats and speckled vests, yellow boots and docked tails, and endowed them with wisdom and strength sufficient to teach them to spread their wings and fly far beyond the reach of the inhabitants of Ogre Castle. That year warfare was declared in the garden, and in the feathered nurseries many an ogre-tale must have been told. Six baby-magpies had to be reared and fed riotously on the choicest of foods.

Some hygienic hens persisted in laying their eggs in the open hen-run; these were found-treasure for the magpies, and during the early hours of the morning the birds descended from their lofty nest and sucked to the shell these oblong, white, succulent spheres. A foolish pair of pheasants chose a nesting-place in the long grass near to the ogres' abode. Their eggs were chipped and sucked, and with loud whir of wing the hen-pheasant forsook her harried nest and we knew her no more.

A wild rabbit, having discovered the sweetness of the grass on the lawn, came in one evening and was nibbling it. Maggie, seeing the stranger, flew down beside him, and with sidling gait hopped all around him; the bird cocked his head to one side, and then to the other, and looked at the rabbit with a droll air of inquiry, gave his unmusical croak, and tried to attract bunny's attention. The rabbit looked up, skipped along the lawn a short way, and then, with an air of indifference, resumed his juicy repast. Maggie continued his manœuvres, but finding his furred visitor regarded him with scorn, gave him a peck. Bunny moved on a pace or two and went on munching. Maggie continued his hopping, croaking, and pecking, and annoying the rabbit until both edged off the lawn and disappeared among the thick shrubs. Could a tragedy have been enacted in that dark retreat beneath the laurels, and was one more crime added that evening

to maggie's long list? Was a too confiding bunny bereft of two black eyes by an artful dodger?

The nebs of these raiders began to appear to us as if they had grown sharper, and their keen eyes regarded us with cruel intensity. After the thrush battle the magpies lost favour. No longer did the drollery of their movements and the beauty of their pied garments atone for their behaviour. We shooed them away when they alighted on the lawn, we hurled epithets of ferocity at them, and they unlearnt their tameness in fewer hours than it had taken months to teach them to confide in us.

In a green yew-tree, wide of growth and smoothly clipped, a family of robins was reared. With what ardour the parent birds built their dainty nest of moss and dry leaves, and lined it with wool and hair and feathers! Robin was a winter pet, who had had the misfortune in the late autumn to get his leg hurt in a mouse-trap. He bore the injury 'manfully,' and we, with thoughts to do him good service, tried to capture him to amputate the hanging limb. Fortunately for robin we inefficient surgeons failed to capture him, and Nature, that wise doctor, set the limb, with the result that cock-robin has to-day a good pair of legs, the injured one somewhat short, which gives him the appearance of being splay-footed; but that only adds to his charm. He had often breakfasted indoors during the time of snow; and his little wife was not more coy than he when food was to be had for the taking. They were dear old friends of the family, and we seemed mutually interested in one another; and when, in bird-like fashion, robin told us where he had built his house by leaving some wisps of wool and dry moss outside his front door in the clipped green tree, there was no difficulty in discovering it snugly built in the heart of the dark yew, and his little wife, with bunched-out feathers and large broody eyes, sitting on the nest, fully occupied with maternal cares. We often called on Mr and Mrs Robin Redbreast, and the little pair seemed pleased to welcome us. One sat quite unconcernedly on the nest, and the other hopped about showing no fear. In due time five tiny, yellowish-brown, naked things wobbled together in their downy nest, with gaping yellow nebs and black sightless eyes, the treasured children of proud cock-robin and his wife. There were no alarms in this nursery, although it was only a few yards from the ogres' castle. The nest was built so snugly and safely among the thick branches of the yew-tree that maggie could only rest himself on the tree-top and cogitate as to how an entrance might be effected into robin's tree-fortress. It was impossible for the long-tailed bird to find an opening, and the brown-feathered baby-robins, quaintly freckled with yellow, reached the rainy day of boyhood and maidenhood in safety. One rainy day I opened the big branch gates of this bird-home and showed the little fledglings a world beyond. Three of them I placed in a basket and carried them into the house. After this adventure into an unknown land I brought them back to their nest; and from that hour they were no longer content with the narrow limits and darkness of their home in the yew-tree. They had seen a world bright with June sunshine, and they had felt their strength. The morning following this expedition three—could it be the same three who had had a glimpse of the world?—were fluttering about among the branches. By midday they were gone; the following day the nest was deserted. I discovered three hopping in the long grass which grew around their tree-home, and during the day two pied ogres hovered around the yew where was reared the robin family. A couple of days later cock-robin appeared alone upon the lawn, pecking up his infinitesimal beakfuls. He chirped to us and was friendly as of yore, and quickly resumed his ways of bachelorhood; but, like others of his kind, he has not for the past two years built a nest within range of the magpie castle.

A white-headed blackbird and many others with orange bills and black glossy coats built in the holly-trees and bushy hedges on and around the terrace where the monkey puzzle held the nest of these wary pies in what was judged to be inaccessible security. The loud, bell-like cry of alarm of the blackbird often roused us, and we knew a speckled egg had been taken from a nest or a hapless nestling had gone to fill a pie.

The song-thrushes, above all birds, seemed to love this garden, and their wondrously and elaborately constructed nests of exquisite workmanship were found in numbers in the boxwood hedges, bushy laurels, rhododendrons, clipped hollies, thorns, and in the fruit-trees in the orchard. During mating season these favourites of British feathered songsters gave us of their richest melodies, and the garden rang sweet,

> Till heart with heart in concert 'beat,'
> And the lover 'was' beloved.

Alas that it is necessary to record that the magpies changed this note of harmony into harsh, piercing shrieks of fear and anger! The song-thrushes, more timid than their relatives the missel-thrushes, could not give battle to the marauders, and their nests were mercilessly harried by the ferocious magpies.

Gay chaffinches, gentle hedge-sparrows, tweeting green linnets, tiny wrens, and all the feathered tribe who claimed tenements in this garden were plundered of their treasures. Perhaps exception may be made of the tits. They found safety in choosing quaint situations for their homes. A blue tit found a nesting-place deep down in a hole in an oak-tree which had for years previous been the children's post-office. These tits, like the robins, were family friends, and fed all winter at the window on fat and cocoa-nut, and grew fearless of humankind and gladly shared possessions with them. A pair of cole-tits made their home in the mouth of one of the cannons which ornament the

terrace and face the ogres' nest, and this 'weapon of death' has proven to be the safest bird-home in the garden. Each year the tits return to it and rear their tiny babies in safety. A piece of wire netting has been placed over the aperture, a barrier against poachers; and maggie's only comfort is found in perching meditatively on the cannon, strutting up and down on it and around it, and looking into the dark opening with covetous eyes. Last year and this year I saw some of the little tits when they flew out of their home in the cannon, and I fancy they escaped the doom of most of this garden's fledglings. The wire netting probably kept them longer within their nursery than otherwise they might have stayed, and their flight was wondrously strong when they set out to explore the wide world, and they could easily find a place of safety for their tiny acrobatic persons where long-tailed maggies could not follow.

But the ogres' assiduity in the plundering of nests has had disastrous results. Last year some twenty nests were found, and this year not more than a dozen, where five times as many were discovered three years ago. Last year a venturous spirit placed a ladder against the trunk of the araucaria-tree, and defying the monkey puzzle thus, climbed it, and with the help of a long pole displaced the magpies' nest, and in so doing several eggs fell out and were destroyed; but the birds set to work immediately and repaired the damage done, and in due time eggs became chicks, and the bandits grew fiercer than ever in their plunderings. The only satisfaction we had was to capture two of the young birds. One was photographed and placed in the cage beside the captive maggie; but its life was short—it was found dead the following morning. This year direr means were taken to prevent pie-nest-building—one of the couple was shot. For a few days after this event the remaining maggie strutted in dejected fashion on the lawn or perched in melancholy mood on a tall tree; then he sought himself out another mate, and together they built an impregnable fortress in the bushy crown of a silver fir a few yards distant from the former pie residence, and five handsome black-and-white-plumed young birds have been sent out into the world. The parent birds, being satisfied with their family, now crouch on the spreading branches of a cedar-tree and look defiantly in at us through the dining-room window, conquerors of a lamentable situation—a garden deserted of small birds!

During the winter the caged ogre met with a violent death—she was discovered decapitated in her den. A rat, we surmise, had been her judge and executioner. Another judge has donned the black-cap of doom, and any pie convicted of nest-building in this garden in the year 1908 is to be shot dead. The years of grace have passed for these nest-robbers, and the bird-forsaken garden cries out for redress.

A PAWN IN THE GAME.

CHAPTER XIII.—IN PARIS AGAIN.

IT was late one afternoon when Jean—he took a French name again as soon as his feet touched French soil—found himself in Paris once more; and as he walked, dressed as a French workman and with a story to match, along its narrow streets, it seemed as though the years betwixt had slipped from him. He almost felt himself a gamin again. He looked around, expecting to see the Rat thrust his pointed chin and ferret-like eyes out of some dark alley. All his old familiarity with the city revived. He walked past madame's house, but the building was shut up and apparently empty. He had secured a room without difficulty in a narrow street near the Châtelet, and spent the first day exploring the city.

But he quickly realised that it was a new Paris on which he looked. Here was a city not merely shaken with a thousand agitations and passions, effervescing with angry oratory in every square, and black with drifting and excited crowds on every pavement. The crowds wore a strange aspect. The signs of wild alarms and of wild hopes were visible enough; but there was something added which Jean had never seen before. The dark, preoccupied look on men's faces, the hurrying steps, the whispered and furtive conferences—all seemed to him tokens that some mysterious event was on foot. The sense of a swift-coming crisis seemed to be in the very atmosphere.

He had reached Paris at a moment history was long to remember. It was the afternoon of August 9, 1792. In the hours of the coming night great events were fermenting.

A revolution, especially of the French variety, is apt to march quickly. Jean had watched the procession of the States-General on May 4, 1789—a little more than three years before. It was, as events proved, a stately and picturesque illusion. In less than six weeks the Tiers État had thrust both the other orders aside and proclaimed itself a National Assembly. A month later the Bastille was falling.

How much had fallen since! The Church had gone; the nobility had fled; the king had tried to flee and had been brought ignobly back. What a wreckage of ancient traditions and habitudes the astonished world had seen! But it is not easy for a nation to cast off a whole set of social forms and to evolve a new set. Ancient names yet survived

political traditions and usages that ought to have disappeared still walked about like animated corpses that had somehow evaded burial.

France was still a monarchy. Louis XVI. sat in the Tuileries, his red Swiss Guards about him. He even ventured, on occasion, to whisper the magic word 'veto' that paralysed the most beneficent laws. The Assembly debated; but it was broken up into three great mutually hating parties—the Gironde, the Plain, and the Mountain. The Mountain, in which were reflected the passions of the Paris sections, was in a minority. The Paris municipality itself, that had flamed so long a portent to mankind, had sunk to mere smoke. It threatened, indeed, to become an extinct volcano. The Revolution would not march.

Impatient Paris could wait no longer. The forty-eight sections had met, and had each elected three representatives whose patriotism was of a heroic quality. These one hundred and forty-four were to form a Commune—a name destined to be terrible. This very night they intended to seize the Hôtel de Ville, dismiss into space the old Municipal Council, and capture Paris; and Paris, at that moment, in a special sense was France. A state of insurrection was to be proclaimed; the National Assembly was to be purged and transformed into the Convention.

The Revolution, in brief, was moving to its natural climax. Its wilder forces were capturing it. Betwixt the States-General and the Convention, the old Paris municipality and the Commune, the Cabinet of Necker and the Committee of Public Safety, there is an interval of time surprisingly brief. But how wide and terrible is the moral interval which parts these names!

Jean, of course—though, thanks to his early Paris experiences, he understood something of the French temper and the drift of French affairs—did not realise all this. Yet he felt vaguely that wild forces were abroad. The night was clear; the high stars shone in the quiet heavens. A curve of white fire—the crescent moon—hung above the black towers of Notre Dame. But if there was peace in the star-crowded sky, tumult and storm were on the dark earth. Paris was awake in every nerve. In its narrow streets and dark lanes strange tides were flowing, and in spite of himself Jean caught the infection of the restless crowds. He swung with the hurrying groups betwixt what some strange instinct proclaimed to be the two opposing centres—the Tuileries and the Hôtel de Ville.

The Assembly was in session, with open doors and lighted windows and sounds of debate that at times reached even the jeering streets; but that wild night the Assembly was rather the prize of combat than one of the combatants. Round the Tuileries flowed more ominous sounds—the rumble of guns, the clatter of armed squadrons, the tread of disciplined feet, hoarse shouts of command, the clash of steel. There was the glare of lights in every window of the great building. And from the crowded bridges near, from every street that opened on it, sullen crowds watched the hated palace of Louis XVI.

But Jean realised that the Hôtel de Ville was the true centre of action. Its dark front was pricked with a hundred red points of light. Agitated figures thronged in and out of its doors. The black streets about it were full of agitated crowds. Here was the true heart of Paris, and all about it passions cruel as fear and blind as the night were rising like some sea-tide. Across the house-roofs from every direction, now harsh and now faint, came the sound of drums beating the *generale*.

A little after midnight Jean was passing the most picturesque of Paris churches, Saint Germain l'Auxerrois, when from its tall and graceful tower broke, sudden and deep, the stern clamour of bells. It was an evil omen. A little over two centuries ago from the iron throats of those same bells came the signal for the bloody feast of St Bartholomew!

Jean stood still to listen. The storm of sound grew wilder as one church tower called to another through the night. The black midnight sky was shaken with the iron clangour of alarm-bells. The sound set all feet running, and Jean presently found himself one of a vast multitude in front of the Hôtel de Ville. Its gloomy mass wore a more evil aspect than ever, with the frantic sound of the calling bells rolling above its roof, red lights in its many windows, and the tumult of the shouting crowds about its walls. But for a while nothing happened. The Revolution loitered. The wild, planless hours crept on, and still no signal for movement came. The crowd wanted a leader, some single figure visible and picturesque. A committee of a hundred and forty-four patriots, with scarfs, even though their patriotism is beyond proof, cannot persuade a revolution to march.

But the sections were somehow—nobody exactly knew how—set moving at last, and in the gray dawn the angry human tide about the Hôtel de Ville found direction. The streets were shaken with the tread of countless feet. Paris—the Paris of the sections—was about to fling itself on the Tuileries! Soon all the bridges and streets that opened on the great building were black with crowds more or less armed. The stately palace was an island round which a wrathful human sea was flowing in wild eddies, and over which these eddies must soon break.

Jean climbed on to the parapet of the Pont de Neuf, from which he could see the whole front of the Tuileries. Across the streets opening on to it were clusters of guns and squadrons of cavalry. In the garden of the Tuileries itself were clear-cut lines of red, the steadfast and faithful Swiss. Agitated figures, with gestures of alarm, came and went at all the windows; but that girdle of red was steady as granite.

Jean turned presently to look at the faces about him. Near him was the figure of an artillery officer with uniform not too fresh. The clear-cut features, the complexion with its tints of dead gold,

the straight forehead, the flashing eyes, seemed familiar. Jean looked again. It was his comrade of Brienne, *Paille au nez*—the Napolione of bygone years. His hair was cut square on the forehead, and hung down the cheeks, making a dark frame for the thin and sallow face.

Jean felt his pulses quicken as he looked; he involuntarily put out his hand and touched the arm of his old chum. The artillery officer turned. The keen dark eyes ran swiftly over Jean's features. There was recognition in them; but after a few brief words he turned impatiently to watch the scene before him.

He had no time to waste on personal emotions. He was looking at history; and Jean, as he glanced in turn from the Tuileries to the face of his companion, clear-cut as the die of a coin, tried to guess what thoughts were behind the mask of those intent features. Here was a conflict of forces—disciplined force with the red Swiss, the energy of numbers and of passion with the crowd. This shabby artillery officer was plainly assessing these threatening opposites.

His instinct as a soldier made him sympathise with the Swiss. His eyes ran with a look of contempt over the distracted crowd. Here was power, the power born of mass and of fury, but it was planless and blind. Then he fixed his gaze on the slender but steadfast lines of red—the orderly guns drawn across the streets, the squadrons of cavalry behind, the horses' heads tossing impatiently. They were few, but they represented discipline.

'They only want a leader,' said Napolione, as though to himself; and as his quick, deep eyes ran to and fro from the crowd to the little red parallelograms in front of the Tuileries, Jean felt that here was not only a soldier assessing the rival forces, but a leader choosing the points of attack or the methods of defence.

Just then a group of figures came out of the great central door of the Tuileries. Women and children were in it. They passed along the red lines of the Swiss, and came down the main walk to the central gate. As they approached it a deep roar went suddenly up from the crowd. It was the king and the royal family.

Yes, the stout, farmer-looking man was Louis XVI.; the woman with proud uplifted head was Marie Antoinette; the child, that kicked with a boy's careless foot the leaves on the path as they walked, was the dauphin. To what strange fates the little group was moving—to the Temple, to the guillotine!

The dense mass opened to receive them, and they were submerged in a sea of tossing figures, a wild tumult of voices. They reached at last the doors of the National Assembly and disappeared within them.

Napolione had followed the little vanishing group with scornful eyes. He read with swift, unerring judgment the whole significance of the incident.

'It is a surrender,' he said; 'it is cowardice. This king'—and there was an accent of bitter contempt in the way he pronounced the word—'will not strike a blow for his crown.' Then after a moment he added with yet more fiery scorn, 'It is a betrayal.'

He was looking at the immovable Swiss. They were left, without a leader and without orders, to guard an empty palace. Louis XVI. had forgotten his guards, and the forgetfulness was for them a death-warrant. The crowd was now beating furiously at the gates. The cavalry squadrons were breaking up; the guns stood abandoned; only the Swiss remained moveless in their silent lines.

There came a pin-point of white smoke from the crowd, the sound of a shot. Then followed a tearing sound—the crackle of many shots, and a wild tumult of human voices. The people were attacking! Then came the deeper sound of guns from the Carrousel.

The Swiss begin to fall; before ten minutes have passed, dozens dead or dying lie at their comrades' feet. The steady, tormented red line breaks at last into flame and smoke, and the long crackling thunder of platoon-firing dominates all other sounds. The crowd rolls back as if scorched by a wave of flame; the pavement in turn is strewn with fallen bodies. Napolione's eyes gleam. Discipline is overmastering numbers.

But the crowd is in a fighting mood. It is running forward again, silent now, but in deadlier fashion. Napolione's eyes glance impatiently to the guns on the right of the Swiss, but they are silent. The gunners have fled. A cloud of powder-smoke blots out the scene for a moment. There is the sound of furious but irregular musketry, the firing of the crowd; and as the smoke for a moment lifts there can be seen the mad running to and fro of little groups that are trying to climb the gates or break through them. But within, at the very heart of the smoke and tumult, still come like ordered claps of thunder the volleys of the Swiss.

'They want a leader,' the artillery officer at Jean's side is saying afresh; but almost while he speaks the thunder of the rolling volleys dies away. An order to 'cease firing' has come to the Swiss. The word runs down the disciplined ranks, one officer calling to another, the sergeants striking up the smoking muskets. The red lines stand silent.

But from the bridges the guns still flash upon them; from every direction the crowd still fires. The unhappy Swiss have ceased to shoot, but not to be shot at. The best troops in the world would be destroyed under such conditions. In a few minutes the steady red lines begin to crumble. The Swiss waver. Some run back into the building; the main body, tormented with incessant musketry fire, moves towards the gate and begins to file through. The crowd closes fiercely on the unfortunate soldiers. They are torn into broken, irregular groups, into flying units—little atoms of red, struck at from every side, stumbling, falling. It is a

massacre. Round each red speck the black crowds shut with thrusting points of steel.

Jean had watched the sight with clenched hands and compressed lips. His sympathies were with the gallant, betrayed, ill-fated Swiss. He turned to look at his companion. The frown had gone from his brow; he was watching the scene with a curious look. Here was the birth of a new and terrible energy taking place under his eyes.

'If *they* had a leader!' Napolione was saying, and somehow Jean divined that Napolione's words applied to the crowd. He had assessed the two opposing forces. For him they represented not principles but energies. And he was in the last analysis a mercenary, prepared to take the side of the strongest force, and to sell his brains to it, since its service would open the door of the widest future to him. Jean read enough of his companion's thoughts to shrink from him, chilled and disappointed, but he could hardly realise that at the moment Napolione himself had turned Jacobin.

The crowd by this time had swept into the Tuileries and flooded all its rooms. Wild figures came and went at its windows; the building shook to the sound of musketry-shots and to the crash of shattered doors. Furniture was being flung out on to the garden walks. They were witnessing the sacking of a palace. The two men watched the spectacle for long in silence; then, tired of watching, they forced their way through the crowd. At a street corner they were stopped by a group of citizens drunk with the passion of the fight. They bore aloft on a pike the head of a Swiss; and, stopping passers-by, they compelled them to salute it and to repeat the watchword of the day.

Jean felt his blood take fire at the sight, and he halted with a look of stubbornness on his face. But Bonaparte pulled him on. '*Vive la nation!*' he cried with a gesture of contempt to the wild group with their bloody symbol.—'It is only a phrase,' he said with scorn. 'Would you soil your coat for the sake of a phrase?'

'It is more than a phrase,' replied Lawrence stubbornly; 'it is a sign of sympathy with murder.'

But the only reply of his companion was an impatient shrug of the shoulders. 'I care only for realities,' he said.

They walked side by side for some distance. Napolione was preoccupied and silent, and Jean felt his companion's thoughts were moving in some field remote from him. He was trying to read the riddle of the tragedy they had just witnessed. What were the forces at work in this wild scene, and whither were they hurrying? Jean lacked courage to break in on his thoughts.

'What are you doing in Paris?' Jean's companion asked suddenly. 'You have no business to be here.'

Jean hesitated as he looked at the passionless face of his old schoolmate. Here was a mind over which mere sentiment had no authority. He felt it would be idle to tell his tale or to ask for sympathy. While he hesitated, Napolione turned away with an impatient gesture.

'You have your own secrets; take care they do not cost you your head. I am for Corsica;' and, with a gesture of farewell, he moved away and was lost in the crowd.

(To be continued.)

A CITY OF ETHIOPIA.

PART II.

HARAR is one of those places of whose history and origin but little can be stated with certainty. Places of this kind are visited from time to time by travellers of various nationalities, who set forth their impressions in books of travel, memoirs, &c., and who often boldly advance the most glib accounts of their history both ancient and modern. Heaven only knows how this information is arrived at! More often than not it is taken down from the mouth of some old sheik of romantic tendencies and a keen scent for backsheesh; and, after passing through the hands of the merciless dragoman, who gives *his* version of the matter, it takes its place among the valuable notes of the profound historian, duly to appear in some 'work' dealing with the place concerned.

What seems certain about Harar is that the town and province was for long a free and independent state. The inhabitants are a distinct tribe, probably of Semitic origin, and use a language of their own, which, though containing many words from the Arabic, Amharic, Galla, and Somali tongues, is not sufficiently like any of them to be intelligible to a stranger from the far provinces.

It was probably during the invasion of Abyssinia by the Arabs early in the sixteenth century that the people of Harar embraced Islam, though what their faith was before that is open to conjecture. It might have been some form of Judaism; certainly there are many traces of this religion in their observances of to-day.

The people have complexions of about the same hue as the Arabs of Arabia, fine-cut features, thin lips, and black, wavy hair. The chief industry is the cultivation of coffee, whilst the enormous trade which flows in from the surrounding districts gives employment to the large population of the town.

In 1875 the place was taken by the Egyptians,

who sent an expedition thither from Zaila, a port on the Somali coast then in their possession. During the events of 1884–85, when the far provinces of Egypt were broken up, and the towns of Zaila, Berbera, and Bulhar were taken over by Great Britain, the Egyptians began to evacuate Harar, and a small expedition was sent from Aden to facilitate the withdrawal of the garrison and to make certain arrangements for the future government of the state. The party, which consisted of three British officers and fifty Indian troopers, arrived safely in Harar, and saw the last batch of Egyptian soldiers on their way to Zaila. The mission then sought out the descendant of the old line of emirs, one Abdullahi, and having set him up as the independent ruler of the town and province of Harar, departed for the coast, leaving the place to its fate. This astonishing act of folly is said by those who are in a position to judge to have laid the foundation for that long series of troubles in Somaliland culminating in the successful revolt of the Mad Mullah. For, whilst we occupied the Somali country from the coast, and thus prevented the inhabitants from arming themselves, we failed to provide them with adequate protection against the well-armed Abyssinians, who subsequently took possession of Harar, and swept down from the highlands upon their flocks and herds. But this is anticipating matters.

The Emir Abdullahi was a mere boy, and became simply a puppet in the hands of his savage and fanatical sheiks; and no sooner had the British officers departed than he commenced a rule under which all non-followers of the Prophet were treated with such severity and injustice that in a very short time scarcely any who were not Moslems would dare to reside in or even visit the place.

At this time there were living in Harar several Greek and Armenian traders, besides a number of French monks under the missionary Bishop Taurin. This zealous and indefatigable priest had been connected for a number of years with the movement which had vainly endeavoured to introduce Roman Catholicism amongst the Abyssinians, and he had arrived anew in Harar in 1881, armed with the special permission of the Khedive of Egypt to establish a mission. The position of all these Europeans was now highly dangerous, cut off as they were from any assistance, and surrounded by bloodthirsty fanatics. The death of the bishop was actually decreed at one time, but his life was spared on the solicitations of the emir's mother, and eventually the Europeans were all sent down to Zaila.

One of the most atrocious acts of the emir was the treacherous massacre of an Italian scientific expedition, under the Count Poro, early in 1886. The party, which comprised nine Europeans, and was accompanied by a large caravan, had reached a point near the town of Guildessa, about thirty miles north of Harar. When the news of its arrival was conveyed to the emir he hastily assembled his advisers, and the result of their deliberations was that a force should be sent to annihilate the *franghis*. Accordingly, about forty Turkish irregulars, or Bashi-bazouks, as they are called, in the employ of the emir were despatched, together with a vast horde of native warriors. These gentry accomplished their work in a way which did credit to their reputation. They arrived at the encampment of the Italians, whom they saluted with the most profound signs of esteem and friendship, assuring them at the same time that the emir was pleased with their visit, and was then making preparations to receive them with due honour. There was only one thing, however, which they must ask them to do, and that was to leave all their rifles and ammunition behind, and to enter the city unarmed, in order to show the populace that their intentions were peaceful. This was assented to, and the whole concourse set out for the city, the Italians and their servants in the middle. Apparently they were being escorted in honour to the emir.

What followed may be easily guessed at. At a given signal from the dastardly Turks, the spearmen precipitated themselves upon the helpless little band and slaughtered them to a man. Not one of these brave fellows escaped to tell the tale. Peace to their ashes! Honour to the gallant gentlemen who gave up their lives in the interests of science, and perhaps of their country!

The career of this young man as a sovereign was not of long duration. The Abyssinians, who were never loath to add another slice to their large empire, and to create a new field for plunder and taxation, had for long cast covetous eyes on this prosperous and fertile country, and had only been restrained from seizing it by the consideration of the risk of coming into conflict with Great Britain; but, judging from the apathetic way in which the conduct of the emir had been treated, that risk now no longer existed. This was the very argument used by Monsignor Taurin, who from his retreat in Zaila was in constant communication with the Abyssinians, urging them to go and take Harar. To these counsels were added those of Italy, who gave promise of her moral support and countenance (whatever that might have meant), and at last the Abyssinians hesitated no longer.

In January 1887 Menelik, who was then king of the sub-kingdom of Shoa, led his army against the Emir Abdullahi, whom he encountered on the plains of Chelenco, about two days' journey from Harar. The Mussulman troops were annihilated, and the victorious Abyssinians marched on to the town, which they took after an easy assault.* Their treatment of Abdullahi, whom they took prisoner, must have been extraordinarily moderate, for he is still to be seen walking about Harar, a sadder and wiser man. He may go anywhere within the walls, but is not allowed to leave the town. He is quite a

* It has been stated that before taking this step Menelik obtained the consent of Great Britain.

young man still, and of very handsome presence. He generally goes about with a little retinue of Moslems—the shadow of his former state—besides the ever-vigilant Abyssinian soldier, who will not be found far away.

The question might well be asked as to what Great Britain was doing all this time. It was considered by the Ministry of that day to be inexpedient to establish our claims over Harar. We are a strange people, for we have just spent many millions of pounds and hundreds of valuable lives in a prolonged and unsuccessful struggle for a piece of the Somali desert of no earthly use to any one but the nomads who inhabit it, whilst we have twice allowed to slip through our fingers the opportunity of annexing one of the most glorious countries in Northern Africa.

The Abyssinians are represented in Harar by the nobles who hold military rank, the priests, and the common soldiers; these last are said to receive only arms and rations of millet in payment of their services; their other wants they supply by the simple expedient of robbing the peasants, who, knowing that they could never enjoy the full fruits of their labour, do as little as possible, and hide whatever wealth they possess. In the same way the petty chiefs are afraid of their superiors, and dare not display their possessions in case they should be accused of withholding the taxes or otherwise accumulating for themselves that which should flow into higher channels. The same state of feeling is said to exist between the governors of the different provinces and the emperor, who in his turn is always in fear of a plot against the throne, and who has spies in every district.

The present population of the town is estimated at seventy thousand, and the area enclosed by the walls was calculated by Burton to be one hundred and twenty-eight acres. Justice is administered by the Abyssinian chief, the court being held in a sort of open shed—a flat-roofed building which looks as though one side had been taken bodily away—in the main square of the town. It is an amusing sight to watch the process of a case. The vociferation is terrible; every one seems to be speaking at once. The judge sits at the back surrounded by a number of soldiers armed to the teeth and ready to do his slightest bidding—which is, perhaps, to give some one fifty strokes with the *corbash*, or even to cut off a hand or a foot, for punishment is always of a drastic nature in this country. People are imprisoned for debt, or occasionally heresy within the Church; but theft is always punished by the *corbash* or by mutilation. The way in which the latter dreadful sentence is carried out is particularly revolting. The operation is performed by a person of no surgical skill whatever, who simply severs the member with a scimitar or some like instrument; the bleeding stump is then plunged into a vessel of boiling oil, which has a cauterising effect. But even then the unhappy wretch's troubles are not over; he has to sit for two days at the principal gate of the city with the amputated part placed close beside him, and every person who passes by shows his contempt by covering the mouth and nostrils with a corner of the robe as described before. Murder is dealt with in a peculiar way. The murderer is first given a chance to show reason or justification for his act, and if he cannot do this he is handed over to the relatives of his victim, who may, if they like, accept blood-money, or who have the right to take him outside the city walls and put him to death.

The excise dues of Harar are something like Sam Weller's knowledge of London—'extensive and peculiar'—for not one single article, be it the produce of the country or the imported goods of civilisation, comes into the city without paying duty; from a bale of cotton goods down to the smallest pot of honey or calabash of butter, all add their quota towards swelling this important source of the emperor's revenue. Even the poor women who travel great distances with loads of firewood are stopped at the gates whilst the lazy soldiers rob them of some of their gleanings. The chief articles brought in are ivory, hides, and coffee, besides an enormous quantity of fresh provisions for the consumption of the inhabitants. The method of collecting the dues, though not very up-to-date, is fairly effective. A man comes along with an ox-hide, and he is stopped at the gates; presently another comes with some goat-skins or perhaps a rush-mat, and he also has to wait; after a while these are joined by some more carrying raw coffee; then come women loaded with bananas, honey, milk, butter, eggs, &c. This goes on until a crowd of twenty or thirty are gathered at the gates. Then one of the soldiers in authority gives an order, and the whole motley gang is marched through the town to the custom-house, where they pay their dues according to the nature and quantity of the articles they have brought. How the money received is accounted for it is difficult to imagine; however, a couple of clerks are seated cross-legged before great books, in which they write in Amharic characters. The emperor has a direct representative in the custom-house, as has the local Ras, and doubtless each of these worthies contrives somehow to satisfy his master and incidentally himself as well.

There is not much of interest about the Abyssinian church in Harar; it is a fairly large building of recent construction, circular in shape, and having a sort of dome roofed with tin, which has only too obviously been cut from kerosene-cans. The inner wall, however, which divides the priests' compartment from that assigned to the worshippers, is covered with very quaint paintings depicting scenes in the life of Christ and of the saints, as well as likenesses of kings and princes of Abyssinia both living and dead. These works of art recall in a most astonishing manner some of the old masters; there is the same lack of perspective and the same brilliant colouring.

Amongst the curious relics of Judaism which seem common to the Abyssinians and the Moslems of this place may be mentioned circumcision (which is a solemn rite of the Abyssinian Church, taking precedence even of baptism) and the prayer (differing, of course, in form) which must be uttered as the throat of an animal intended for food is cut. Besides this is the custom of assembling to wail at a house where some one has died. I was very much amused one day watching one of these performances. Two long rows of women were squatting on either side of the lane leading to the house. Evidently a solo was on, for a young girl was walking up and down, wringing her hands and giving vent to the most dismal cries of lamentation, and so well did she do it that tears were actually coming from her eyes. After a while she sat down quite composed, and another took her place. I felt strongly inclined to laugh, but remembered in time that Abyssinia was not the only place where crocodile tears were shed.

Let us take a stroll down into the principal market-place.

Crossing the square, which lies in the centre of the town, we pass the great gateway which opens on to the first courtyard of the Ras's house; above the portals crouch the carved lions of Egypt, relics of the Egyptian rule, and over these waves Menelik's banner—red, green, and yellow in horizontal layers—with the Conquering Lion of Judah set in the middle.

We now descend a street which resembles a mountain donga more than a thoroughfare; nevertheless, its sides are packed with booths, on the counter of each of which there sits cross-legged a Harari, an Arab, a Somali, or even an Indian. The whole stock-in-trade of one of these 'merchants' is not worth more than a few pounds. Notwithstanding this, however, trade is brisk, the street is completely blocked in places, and the air is full of the sounds of the bargaining and haggling which is the essential part of any transaction amongst these people.

At the bottom of this well-like passage is the market-place, a large open space literally crammed from end to end with the buyers and sellers, the latter squatting in long rows with their wares arranged in little baskets and trays in front. All those of a trade sit together. In this corner, for instance, are the money-changers (who are shouting out their rates of exchange); yonder are the butter-sellers; then come the grain-dealers, the vendors of spices, and so on. In one corner is a large group of Galla girls all standing together chattering. These are water-carriers, and they are waiting for some one to come and hire their services.

Leaving behind us the deafening babel of tongues which fills the market-place, we pass through a succession of mean streets shut in by the high stone walls characteristic of Mohammedan residential quarters, and presently arrive at another of the city gates. Here we find an open space devoted to the sale of *kat*, a shrub the leaves of which when chewed produce a stimulating and in many cases an intoxicating effect. *À propos* of the use of this narcotic, to which all the Hararis are strongly addicted, we read in one account: 'The inhabitants often sit together reading the Koran and enjoying the drug for ten or eleven hours at a time'—surely a rather curious combination of piety and dissipation! Throughout the Mohammedan world the use of pernicious drugs is terribly prevalent; in some places it is *hasheesh*, here it is *kat*, but the result is always the same, and the much-lauded abstention of these people from the use of alcohol does not prevent them from seeking other and equally injurious forms of indulgence.

Let us stand at the gates for a few moments and watch the varied and ceaseless tide of humanity which surges past. Slave-women are constantly toiling up the slope with their loads of water. The doleful chant of a beggar just outside strikes the ear with well-timed and irritating repetition. This old leper has been here for years, and has a very good 'stand;' he possesses a valuable asset in the shape of a particularly revolting sore, and he lies there all day exposing this and fanning away the flies with a bunch of leaves, and calling out that God is great, and soliciting the charity of the passers-by. It is here that we are able to observe something of the unpitying brutality with which a native treats dumb beasts. Horses and mules pass with the most fearful 'sore backs' ever seen. Judging from appearance, when an animal is seen to be chafed it is not relieved of its burden, but simply worked until it drops. In no other way could these terrible ulcerations be accounted for.

All of a sudden a great shouting is heard, and, looking back, we see a compact mass of soldiers sweeping down the street. Urchins are cuffed, and market-women scuttle out of the way with their wares. The Ras is going for a ride! As the concourse approaches we perceive the great man in the centre mounted on a truly splendid mule, and accompanied by his little son and two or three minor chiefs. On seeing us he bows courteously, and the whole procession passes through the gates, all the bystanders bending almost to the ground.

We now ascend the street leading from this gate; it is comparatively quite a broad street and is roughly paved with cobble-stones. What a strange medley of people it shelters! Here is a steaming cook-shop presided over by a couple of Turks who are most palpably deserters from the Turkish army; they still wear their tattered and greasy uniforms. They are probably from Yemen, across the Red Sea. The adventures they have been through before reaching here would form an interesting narrative. Here is an Armenian standing at the door of his drink-shop; inside, the shelves are filled with bottles containing all sorts of vile poisen labelled 'Mastic,' 'Arac,' 'Three-Star Brandy,' &c.,

most of which is manufactured on the premises and sold to the Abyssinians at about elevenpence a bottle.

We now wend our way towards our quarters again, for it will soon be dark; and wandering about the streets after that is by no means an agreeable occupation; there are absolutely no lamps whatever, and the thoroughfares are so rocky and obstructed by filth and garbage that it is necessary to feel one's way very carefully, and to take servants carrying lights, the law as well as prudence making the latter precaution necessary. At ten o'clock a call is sounded on a trumpet, which means that all respectable citizens must be within doors; from that time the only sounds which break the silence of the night are the long-drawn cries of the watchmen, who pass the call at intervals, and the howls of the hyænas that prowl round the walls of the town.

It is the last evening of my stay, and I am sitting high up in the balcony of my quarters gazing across the city into the green country beyond. The air is full of the droning cries of the *muezzins* calling the people to prayer; and, looking across the roofs, I see many a white-robed figure turned towards Holy Mecca with bowed head and hands outstretched. '*Allahu akhbar*,' they cry ('God is the greatest'). 'I witness that there is no God but God. I witness that Mohammed is the Messenger of God. Come to prayer! Come to salvation! God is the greatest!' How strange that these simple and touching sentences should form the basis of a creed which has the power of turning men into devils and keeping nations in darkness and ignorance! Yet has not this been the case with all the religions? Have they not appeared full of noble sentiments and lofty aims, only to become later the vehicles of the worst passions of mankind? How many there are of them even to-day! They could scarcely be counted. May there not have been a message from the Supreme Being everywhere, though the pride and selfishness of man has since stepped in to mutilate or destroy it? Perhaps in that more perfect world which we are told is to be the reward of the orthodox righteous many shall meet and commingle who are now at bitter enmity. Let us hope that it may be so.

TONELLI'S GOLD.

CHAPTER III.

EIGHT weeks had gone by since the accidental meeting of Carlo Tonelli and his nephew. Much had been accomplished in the interim. Santi had visited Paris, Brussels, and Amsterdam, and in each of those cities he had managed to get rid of a thousand of his uncle's sovereigns by changing them into the notes of each country in turn, rechanging the latter into English notes after his return to London. Berlin was the next place to be visited by him, and after that Hamburg. London was reserved by Tonelli for the last venture of all.

Santi, who had considerable natural audacity, was by now quite as eager as his uncle to carry on the adventure, and he could not see why the latter need have decided to bring the affair to an end with the disposal of the sixth thousand of his sovereigns. As he argued, feasibly enough, by the time the early thousands began to change colour they would have been scattered broadcast, and mainly in driblets, over Europe, so that it would be impossible to trace them back to the hand that had first put them into circulation. But Tonelli could not be moved from his original determination. As soon as the sixth thousand of his coins should be disposed of he and Amata would vanish and be seen in England no more. Santi cursed him in his heart for an old fool, while accepting his decision with a smile and a shrug of seeming resignation.

Well might Santi feel desirous of prolonging his present mode of life till the last possible minute. Never before had Fortune smiled so graciously upon him. He was well and fashionably dressed at his uncle's cost, with an expensive fur-lined overcoat to keep him warm during the winter months; he was wearing a gold watch and chain; and if the two rings that adorned his fingers were paste, they had all the appearance of being worth twenty or thirty guineas apiece. When on one of his journeys he was now in a position to be welcomed as a guest at any of the hotels at which in bygone years he would have been glad to accept a post as *garçon*. Finally, there was his commission as agreed upon between himself and his uncle, which the latter had not failed scrupulously to pay him. Very sorry was he to think that an existence so pleasurable should be condemned to come to so speedy a close.

His uncle's words as they sat alone on the night of their coming together—'Amata would make thee a good wife'—had sunk into his mind and seemed as if written there in letters of flame. They had burnt into the texture of his being. Whether waking or sleeping, even when engaged with the special purpose that had taken him abroad, his thoughts were subconsciously coloured by them. What a superb creature she was! The joy of life seemed to glow in her veins. How was it possible to see her and be near her without falling passionately in love with her! For him, he told himself, it was not possible. Yes, he would make love to her, and try his utmost to win her for his wife.

And yet? But resolute men brush obstacles aside and go more resolutely on their way. In any case, Sorrento is a long way off, and is lost to the world save for a few tourists, birds of passage, who come and go during the weeks of early spring.

He was in love with his cousin by the time he got back from Paris, and when next he saw her and again came under the influence of her magnetic personality, his determination to win her, if it had had its wavering moments, had none from that day forward. He was a man quick in action when once resolved, and he lost no time in letting Amata see how badly he was bitten by love's tarantula. The girl was quick of apprehension, and she only needed to look into Stefano's eyes to gauge what was the matter with him. And then, almost without any volition of her own, her eyes began to answer him back; for, if he had thought much of her while in Paris, his image had dwelt persistently in her mind while he was away, and a very agreeable image she had found it to contemplate. Her heart had never yet been touched, but she was ripe for love; and when Santi, after being back in London a week, said to her, '*Carissima*, wilt thou be mine?' in no coy tones came her answer, 'Through life and in death I am thine, and thine only.' Then they kissed, and yet again, for the blood of the South ran warm in the veins of both.

When Tonelli was told he smiled approval, and said, '*Benissimo!* thy news brings gladness to my heart.'

Then for Amata began a week of gaiety before Santi took his departure for Brussels. The ordinary sights had heretofore been like a closed book to the Italian girl, for her father took her nowhere; but now she and her lover were out from early forenoon, winding up the day, after dining at a restaurant, at a theatre or music-hall. Amata felt that she had only just begun to live.

After Santi's return from Brussels there came another happy ten days before he started for Amsterdam. The same thing happened after his return from the latter city, and once more our pair of lovers had a good time.

Santi was very proud of his beautiful *fiancée* and of the admiration she excited wherever they went; but to Amata it seemed a matter of indifference how other people regarded her. At this period all she appeared to live for was her love for Stefano, which was of a depth and intensity which at times caused the volatile young Italian to feel indefinably uneasy. That he loved her after his fashion was undoubted, but it was after a fashion very different from hers. One day she said to him, 'Stefano, swear to me that thou wilt always—all thy life long—love me as much as at this moment.'

'*Carissima*, I swear it,' he answered lightly.

She breathed a sigh of full content. But a few moments later she said, 'Oh, if thou wert to change towards me, or try to deceive me in any way, it would be bad for thee! I am thine and thou art mine. Play me false, and thou wilt be sorry for it to thy dying day.'

Something in her tone caused him to turn his head and glance into her eyes. What he read there caused the colour to fade out of his cheeks for a little while.

He often wondered how much or how little Amata knew of her father's proceedings, and whether she had any cognisance of the nature of the business which on three separate occasions within the last few weeks had taken him (Santi) abroad. But seeing that neither by word nor hint had she betrayed the fact of any such knowledge on her part, he lacked the courage to question her about it; for, passionately as she confessed to loving him, he yet felt that there was between them a subtle barrier of reserve which he was expected not to try to break through. After all, he told himself, it was a matter of small moment to him how much or how little was known to her.

About nine o'clock on a certain midwinter evening, when Santi had been a couple of days gone on his Berlin expedition, Giuseppe Neri, one of the two men from whom Tonelli obtained his supply of counterfeit sovereigns, made his appearance at the shop. His coming had been expected, and the old Italian was waiting to receive him. At once the two passed into the inner room and the door was shut upon them. Amata remained in the shop, as she made a point of doing whenever Neri called upon her father.

A quarter of an hour passed, and then Neri emerged from the inner room, and with a smile and a '*Buon sera, signorina*,' addressed to Amata, he went his way. But by ten o'clock next morning he was back, and again he and Tonelli were closeted together.

When, after Neri's second departure, Amata went into the inner room, she found her father looking very pale and troubled. When she spoke to him he seemed not to hear her; but after a minute or two he said, 'A strange thing has happened, *cara*. It worries me because I cannot understand it. Listen. Last night I had to pay Neri a certain sum for work done by him for me. Well, I paid him with two notes out of the parcel Stefano brought me a fortnight since. This morning Neri came back with the notes. They are forgeries, and not they alone, but the whole of the batch, the face-value of which is between eight and nine hundred pounds. Yes, they are clever forgeries, very clever, as Neri, who was in the business some years ago, admits.'

Amata gave utterance to an exclamation of dismay. After staring at her father with clouded eyes for a few moments, she said, 'You don't, surely, suspect Stefano of having brought you the forged notes knowing them to be such?' She looked almost defiantly at him.

'I know not what to think. I'm unwilling to suspect the *giovanetto;* yet there's something

about the affair I fail to understand. When he brought the foreign notes back with him with the view of converting them here in London into English ones, his instructions were not to go to one money-changer only, but—as a matter of precaution—to four or five, and so break up the thousand pounds into several smaller sums. Now, had he done so, although he might have been imposed upon in one instance, it is not conceivable that he could have been in the case of four or five. As I have said, I don't know what to think.' He let his head drop with an air of extreme despondency.

'When Giuseppe Neri was here just now, after he had assured you that the notes brought you last were forged ones, did you not ask him to examine those brought you on two previous occasions by Stefano?'

'I did not fail to do so. He went carefully through them, and'——

'And proved them to be all genuine notes?' broke in the excited girl.

'That is what he vouched them as being.'

'I felt sure of it. Stefano has been imposed upon by a rogue. When he handed you the notes it was in the full belief that they were genuine ones. He may have done foolishly in not acting as you told him to do, but that he had any intention of defrauding you I will not believe.' Her beautiful eyes flashed; her bosom rose and fell quickly.

It did not seem to strike either Amata or her father that the business with which the latter and Santi were concerned was nothing less than a fraud from beginning to end. But possibly to them it did not seem such.

'With all my heart I hope it may turn out as thou sayest. But if when he comes back from Berlin he gives me for the second time a parcel of forged notes, I can only conclude that'——

'But he will not. I feel sure of it. Only wait—wait, and do not condemn him unheard.'

'Most certainly I will not do that. Is he not poor Lucia's son and thy promised husband? Still, I am puzzled—I am puzzled.'

Nothing more was said, but all that day Tonelli went about the house looking anxious and depressed. The money loss alone was a serious one; although that, of course, could be got over by putting into circulation a thousand more of his sovereigns than he had intended doing, provided Stefano were not a rogue and endeavouring to defraud him of set purpose. There was the rub.

He seemed in somewhat better spirits next day, and more like his customary self. No further word passed between him and Amata with reference to the subject which loomed so ominously in the thoughts of both. In the evening his old friend Benedetto Capponi looked in upon him, as he did twice or thrice a week, and the two smoked and played dominoes till the clock struck eleven.

It was a terrible shock to Amata next morning when, on taking her father an early cup of tea, she found him dead in bed. He had passed away in his sleep. There was no need for an inquest, a doctor whom he had occasionally consulted being able to certify that he had suffered from heart weakness for a considerable time—a fact which had been carefully kept from his daughter.

The only mourners to follow the body were Amata and Capponi; but, somewhat apart from the grave, the girl saw Neri standing with bared head.

As a young man, Benedetto Capponi had been a fiery revolutionary who had found it needful to choose between a prison at home and exile in a foreign land. He had sensibly chosen the latter, and although he had long been free to go back to Italy, he had never cared to do so. He was now one of the mildest-mannered old men it would have been possible to find anywhere. He had a small shop on the fringe of the Italian colony where he sold cheap jewellery and cleaned and repaired watches, clocks, and timepieces generally.

He now came to the help of Amata in the affliction that had befallen her. She was about to leave England, she told him. She had near relations whose home was at Sorrento, and she was going to them. She said nothing to him of her engagement to Santi, of whose existence he was probably unaware. So the old revolutionary took in hand the disposal of Tonelli's stock in trade, such as it was, and was very kind and useful in several ways.

Neri's wife came to stay with the lonely girl till Amata should have completed her arrangements. All she was now waiting for was her lover's return. He was not due back for another week, and never had the days seemed so leaden-footed as they did just then. Would the notes he would bring with him be genuine ones or forged? It was a burning question, and it gave her no rest by day or night; for, although she had stood up so boldly to her father in defence of Santi's honesty, there were times when she could not rid herself of a sickening fear that perhaps, after all, he might be acting a rogue's part to the man who had trusted him so implicitly, and to whom he owed so much. It may have been that, without her being aware of it, some subtle feminine instinct warned her that there might be hidden possibilities in Santi of which as yet she knew nothing. But, let that be as it might, her love for him was still as passionate and absorbing as ever it had been.

In losing her father Amata felt as if one of her limbs, and that not the least precious, had been lopped off. They had been devotedly attached to each other, and in those first days of her bereavement she found it hard to credit that he had gone from her for ever. More than once she started up from her chair, feeling sure that she heard him calling her. His unseen presence seemed to pervade the house.

At length there came a morning on which Amata said to herself as she opened her eyes, 'Only three days more and Stefano will be here!' At that moment her heart glowed and palpitated at the thought of their coming meeting, and the ugly shadow of mistrust which of late had haunted her had vanished like a mist in sunlight.

(To be continued.)

SOME PERSONAL REMINISCENCES OF IRISH HUMOUR.

By A. Stodart Walker.

THERE is no more disputed point than the possession of humour by different nationalities. Sydney Smith's dictum that it took a surgical instrument to put a joke into the head of a Scotsman was once quoted in the hearing of Professor Blackie. 'Possibly,' said Blackie, 'an English joke.'

It is, indeed, a curious fact, and much more than a mere *tu quoque*, that most Scotsmen believe in their hearts that Englishmen have no real humour, although they grant them a certain form of mental fireworks which may be labelled 'wit.' But this issue need not be discussed here by a Scotsman who desires to put on record a few instances of the comedy of a nation that has seldom had its humour disputed.

Irish humour is invariably spontaneous and chiefly unconscious, or rather subconscious. An Irishman, indeed, is often most humorous when he wishes to be most serious, and almost invariably when he attempts to be rhetorical. Hence the vogue of the 'bull.' With this form of humour our literature is loaded, and may be supplemented by one which was heard by the present writer at a Nationalist meeting near Stewartstown in County Tyrone. As a peroration to a perfervid speech, an orator thus delivered himself: 'Looking back upon the trackless wastes of the future, I discern there the footprints of an unseen hand.'

Mr G. K. Chesterton once pronounced a homily on the comparative humour of the different English-speaking peoples, and took for his text the story of a member of the House of Commons who, after an impassioned speech, sat down upon his hat; whereupon an Irish member arose and congratulated him upon the fact that his head was not in the hat at the time. Mr Chesterton proceeded to imagine what an Englishman, a Scotsman, and an American might have said under a similar circumstance. The Englishman would probably have simply laughed uproariously or called out, 'Where did you get that hat?' The Scotsman, on the other hand, might have risen and said that it would have been more discreet if the honourable member had chosen somebody else's hat upon which to sit; while the American would have declared to his friends that the habit of sitting upon one's hat had become so usual that the lobbies of the House of Commons were crowded daily with hatters waiting for orders for new headpieces.

It is said that most Scottish stories refer either to theology or drink; and it may as safely be maintained that car-drivers and religion supply the maximum of the inventions of Irish humour. The jarvey is a never-ending source of 'bull' and repartee; even when he is not essentially humorous, he is always picturesque in his language. I remember the first time I landed in Ireland, some fifteen years ago, I gave the driver a fare that I thought would please him, and he immediately returned thanks in the following words: 'You are the finest man I have met for many a day, and when I meet my pals to-night I'll be the richest man among 'em.' I may add a sequel to this incident, for the man who is not averse to 'scoring off' his friends should not be unwilling to pass through a similar experience, with the laugh on the other side of the cheek; and this sequel was an example of the latter. I was relating this incident to some Irish friends, when one of them interrupted me by saying, 'You must have given him double his right fare. You mustn't spoil the market.' 'I gave him what I thought befitted the honour of Scotland,' I replied with a smile. 'That must have been saxpence,' was the retort. 'Or a bawbee,' said another.

Of 'jarvey' stories, the following may be worthy of record. One of these 'immortals' was driving a friend of mine on a very hot day between Dungannon and Maghery; and as the road was innocent of public-houses, the jarvey arrived in Dungannon in a sore state of drouth. He was supplied with half-a-mutchkin of whisky, and was asked how he liked the drink. 'Faith,' replied Pat, 'it's made another man of me, and he would like a drop too;' which reply has a Scottish analogue in the story of the man who was asked a similar question. 'Weel,' said the Scot, 'ye see, I dinna like to gi'e an opinion on ae gless.' There was a driver—Tim—whom I used to hire frequently in County Down. This man persistently appeared, like many of his *confrères*, in the veriest of rags. I never saw him with what appeared to be a fairly new garment on his back. At last, when we became on very friendly terms, I had the courage to ask him if he had ever been measured for a new suit of clothes. 'Well,' he replied, 'I'll tell ye a very remarkable fact; there's not a single tailor in Belfast can measure me, I'm that ticklish.'

I recall a story of Major Harry M'Clintock's which I have not seen printed in any journal. An Irish

jarvey and a Scottish farmer were having high words, when the latter said, 'Ye're a meeserable, half-starved gowk, and I'd caution ye to be warned by our graund Caledonian motto, *Nemo me impune lacessit*. Can ye translate that?' 'Oh, aisily,' says Pat. 'The maining is, you've got something infectious'—these were not his exact words, but they will suffice—'and if I touch you I'll catch it;' which may be counted on the credit side of the Irishman, and which even went one better than the historic retort of the Scotsman, 'Ye may sit doon on the rose and the shamrock, but it's no' canny to sit doon on the thistle.'

Another story, which may be more familiar, affecting the mutual relations of Irishmen and Scotsmen. It was told me by a captain in the Dublin Fusiliers, who overheard it during the war in South Africa. A war correspondent was speaking to a Tommy of his regiment. 'The Dublins have been doing great things,' said the visitor to Mr Atkins. 'Well, ye see, sor, it's this way: for a time in the army it was all the Gordons, and now it's all the Dublins; and if ye have a reputation for getting up early ye may slape till dinner-time.'

Speaking of the war in South Africa, I may tell another story. I was shooting in the north of Ireland. Most of the keepers and beaters were Orangemen and supporters of the British cause; but there was one man who was a perfervid Nationalist and Roman Catholic, and his love for the Boers was synchronous with his hatred for the Orangemen. He was a very good-natured patriot, so I had no hesitation in 'pulling his leg.' 'I hear, Henry,' I said, 'you have two sons at the war.' 'Two sons at the war!' he cried. 'Bedad, that's not true. I wouldn't let any child of mine fight ag'in' the poor Boers.' 'Boers!' I echoed ingenuously. 'You mean the Orangemen.' 'Orangemen!' he cried. 'What do ye mane, sor?' 'Well,' I said, 'you see, they live in the Orange Free State and by the Orange River. Surely they must be Orangemen.' Henry threw up his arms in despair. 'Orangemen are they? Well, to —— with them!' Another instance of this prevalent ignorance and class-prejudice was shown in the case of a farmer in the county of Tyrone, who, whilst driving a donkey and cart, was accosted by a member of the Royal Irish Constabulary. 'Hallo, my good man!' said the constable; 'I see no name on your cart.' The man pointed to a name chalked on a panel of his small 'shay.' 'Oh, that won't do. Don't you know that the law says that your name must appear in Roman characters, legibly written?' The man exclaimed, 'Roman! Oh, to —— with Rome and the Pope!' using the common war-cry of the perfervid Orangeman.

The common use of this expression amongst all Orangemen reminds me of two stories which deserve to pass into print. They occurred in the experience of Dr M'Gettighan, Roman Catholic Archbishop of Armagh, and were told me by Lord Charlemont —than whom Ireland has produced no more brilliant *raconteur*—who, though a Protestant, was an intimate friend of the Archbishop. Dr M'Gettighan, it may be mentioned, was loved as much by the Protestants as by the members of his own Church. One day, when he was a priest in a small fishing-village in the north of Ireland, he was accosted by several of his parishioners, who informed him that a man had been cast ashore and was lying either dead or in an unconscious state on the beach. The priest hurried to the spot, and immediately flung off his coat and began the usual methods for restoring the apparently drowned. After a time his strenuous efforts met with success, and the man began to breathe. The priest continued his exertions, and shortly afterwards he was rewarded by hearing the man speak. The words came blurred and indistinct, but after a time were more intelligible. When Dr M'Gettighan realised that the man was conscious enough to hear him, he said, 'Your life is saved, my good man, and I think the first thing for you to do is to return thanks to God for your deliverance.' The only response was a few incoherent though evidently emphatic words, accompanied by a stubborn shaking of the head. 'Now, my good man, just try to say a short prayer.' The man, however, seemed loath to respond, and the priest continued to press him. 'Just a few words of gratitude—just a short prayer.' The man seemed to soften, and after a time muttered, 'A prayer—a prayer—it's a prayer, is it? Well, "To —— with the Pope!"' In telling the story Dr M'Gettighan remarked with a smile, 'I was in doubt as to his persuasion; but when I heard these words I realised he was not one of mine.' On another occasion he was driving home, when he saw a man, dressed in the full regalia of an Orangeman, lying in a ditch, in an evident state of intoxication. The drunkard's mouth was in a puddle, and ominous sounds indicative of breathing through water were heard. The priest jumped down from his car, and soon had the wretched man out of danger. He lay on the roadside spluttering and mumbling to himself, and giving vent to strange oaths. After a time he became more coherent, and opened his eyes. 'Who are you?' he asked of Dr M'Gettighan. 'Oh, I'm the village priest,' was the reply. 'The priest, are you? Then put me back!' He would rather be drowned than saved by the Roman Catholic Church.

Another very loving and striking personality in the Roman Catholic Church was the late Father Healy, one of the greatest wits Ireland has produced. Most of the stories connected with his name have been already published; but I may add one or two which were told me by one of his intimate friends. Father Healy was travelling in a train near Dublin, and as he sat in profound meditation in the corner of a first-class carriage, he suddenly became aware of a loud altercation on the platform of a small station at which the train had pulled up. After a time the carriage door was

opened, and a bedraggled woman, evidently not a first-class passenger, was hustled into the compartment. She collapsed on the seat opposite to Father Healy, and began to cry out, 'Oh, we'll niver get to Bray! I know we'll niver get to Bray!' As she continued in this strain, Father Healy leant forward and said, 'Pray, calm yourself, my good woman. You are disturbing the rest of the passengers.' 'Oh, we'll niver get to Bray; not on this side of the grave will we get to Bray!' went on the excited woman. 'Of course we will get there. Bray is the next station,' Father Healy assured her. 'Oh no, we'll niver get to Bray!' retorted the disturber of the peace. As the woman was not to be convinced, Father Healy asked her why she thought they would never get to their destination. 'Well, ye see, Father,' she cried, 'it's me brother Mick that's driving the train, and he's had a drop, and when he's got the liquor in him he'll stop at nothing.' 'I assure you,' said Father Healy, 'from that moment my confidence seemed sadly shaken, and I fancied it possible we should not get to Bray.' On another occasion he was sitting in a railway carriage reading, when he was interrupted by a query from a passenger opposite, 'Is that your missal you're reading?' 'It is,' replied the priest. 'And I suppose you believe in purgatory?' said another passenger. 'We are taught to believe in it in our faith,' cautiously retorted Father Healy. 'Bedad, there's no such thing,' said another—'no such thing at all; it's only an invention of the Pope's.' When the train stopped at the next station Father Healy rose. 'I have the honour,' he said, 'to wish you good-day; and as you do not believe in purgatory, I may politely tell you to go to another place.'

Father Healy once made a call upon a friend of mine, whom he found writing in his library. 'Ah, here you find me amongst my best friends,' said my friend, with a movement of his hand indicating the volumes around him. Father Healy took out one of the books at random and found the leaves uncut. 'And it's a perfect gentleman you are,' he said, 'for you don't cut your friends.'

My last Church story refers to the case of a parish clerk who had been newly appointed to a church in the district where I often reside. He was a self-centred, self-opinionated, superior kind of individual, who, despite his Irish blood and humble Irish origin, affected a pronunciation which he fondly imagined to be very high English. One day, in responding to the Litany, he simpered out, 'Spear us, good Lord!' when one of the congregation whispered to his neighbour, 'Oh, blur-an-agers! does he take us for eels?'

A man who had a well-earned reputation as a wit was the late Lord Morris, whom I used to meet on occasions. As in the case of Father Healy, the best stories associated with his name have appeared in print, amongst which is the one dealing with the occasion when he conducted his first criminal trial. 'When I took my seat on the Bench,' he said, 'I thus addressed the jurymen: "Gentlemen of the jury, kindly take your usual places in the court;" and, bedad, half of them made their way to the dock.' At another time he thus addressed a couple of Fenians upon whom it was his duty to pass sentence: 'You are always crying, "God save Ireland!" and you are doing all in your power to make it impossible for Him to do so.'

Mr Baillie-Gage, described by Lord Randolph Churchill as one of the most brilliant wits in Dublin, told me that on one occasion Lord Morris paid a visit to the Land Commission. Lord Morris's views on the proceedings of that body were those of the majority of the political party to which he belonged. To give point to the story, I may say that the previous evening had witnessed the last performance of the Dublin pantomime. On seeing Morris enter the room the chairman thus addressed him: 'We don't often have the pleasure of seeing you here, my lord.' 'No,' replied Morris; 'but I wanted amusement, and the *other* pantomime is closed.'

Lord Morris dined with Lord Aberdeen shortly after the latter came to Ireland as Lord Lieutenant under Gladstone's Home Rule Government. 'I suppose there are many Home Rulers present to-night besides myself?' said Lord Aberdeen to Morris. 'Possibly,' replied the latter, 'amongst the waiters.'

A FORMAL GARDEN.

You lift the latch. A green gate opens in
The hedge of yew,
Which, close-clipped, shields the sanctities within
From outer view.

You pass into a world serene and prim
Of man's device,
With terraced walks, broad lawns, and alleys trim,
Ordered, precise.

The paths are edged with box, and here and there,
Set two by two,
Grave poplars rise with spires proportioned fair
Against the blue.

It is a garden where a man may spend
Long hours alone;
A book in hand, and, at a pathway's end,
A bench of stone.

Near by, a plash and tinkle takes the ear,
Where bravely stands
A marble Cupid pouring water clear
With baby hands.

And all about is that inclusion still,
Severe and rare,
One finds in such a garden-close at will,
And only there.

Such is my garden. Others praise the sight
Of flowers profuse;
For me, the spread of lawn, a statue white,
Dark sheltering yews.

THE LIMITATIONS OF A MONARCHY.

By Henry Leach.

QUEEN VICTORIA had an imperious way. In many respects she was a Queen of queens. The ideal state of the limited monarchy at which we have at present arrived, and which from our point of view constitutes the most perfect and steadiest form of government, was slowly cultivated to something like maturity during the long reign of her Majesty, when the processes were enabled to work on smoothly and without any violent interruption, such as a change in reign sometimes brings about, for over sixty years. In the development of this ideal the Queen herself, without any doubt, played a most valuable and important part. With monarchs of other dispositions and ability such a development in the circumstances of the time might have been difficult or impossible. Yet it has to be remembered that the Queen's own ideas as to the limitation of the monarchy were not altogether shaped towards the ideal which was ultimately reached; and one may be permitted to imagine that she may at times have considered that her queenship was in some respects something of a failure. At the outset of her reign she wished to be every inch a Queen, a most thorough Queen in being. She took over the monarchical control of a people who for a long time previously had been not infrequently disposed to ask themselves whether there was any good in monarchies. For more or less good reason, thrones just then were not held in the highest esteem. And here came to the throne of England a young girl still in her teens, who was fancied to have some idea of effecting a considerable personal rule; so that many of these critics of the system of kings and queens were then inclined to suggest that there was some good in the Salic Law. It was a situation that contained some features of anxiety; and once or twice in the early period of her reign situations arose through the Queen insisting on a very high standard of monarchical authority which were not devoid of elements of danger. For practically the whole of that reign there was a gentle, tactful contest between the Queen struggling for a little more personal power and her Ministers seeking the curtailment of it. The victory was generally with the Ministers, as it was bound to be; but if we were to believe half the stories that we heard, there were many occasions, even in the latest years of her magnificent reign, when the Queen asserted her power to the utmost limits of its extent in interference with matters of State of the first degree of importance. What was the exact truth in these cases the general public will not be permitted to know for many years yet, not in authentic detail at all events; but by the publication of *The Letters of Queen Victoria, 1837–1861* (Murray), we are given a deeply interesting insight into the process of some limitations of the monarchy during the most important period.

Here we see a Queen of remarkable strength of mind and character, imbued with lofty ideals of her country's integrity and greatness, and convinced, not without reason, of her own wisdom and truth, pitting herself constantly against the strength of her Ministers, and the Ministers of that period were generally men of fine force of character. This, of course, is not to suggest that the Queen had not the utmost respect for the letter of the constitution and for the spirit of its establishment as it was felt in the era in which she lived and governed. At times, however, her conception of that feeling was not the same as that of her Ministers, and the value of the variations was inevitably enhanced by the fact of her sex. In the long-run the Queen's strength and the very differences no doubt made for the good of the country, and from the point of view of the best success one cannot doubt that this Queen was for her time. Yet one is given to a fancy as to what she might have attempted and what she could possibly have achieved if she had reigned in another and earlier period, when the monarchy counted for more and when her personality and spirit would have had wider scope. If Victoria had been substituted for Mary or Elizabeth, or if she had been a Stuart Queen, what then?

[*All Rights Reserved.*]

The influences upon her in those few important years of her girlhood before she was called to the throne, and then the ways of Lord Melbourne, did everything to stiffen her view of a superior queenly power and her intention to assert it.

The character of Lord Melbourne was sufficiently well understood before these letters were published; but they do emphasise very remarkably the excessive amiability on the one hand, and the frequent unstatesman-like weakness and incapacity on the other, of the Queen's favourite Minister during the early period of her reign. The friendship between Queen and Minister grew until it was of the most affectionate character, when we find communications on important matters of State constantly including inquiries and remarks upon details of personal and family affairs. All his faults being recognised, it has still been frequently conceded that Melbourne was of great value to both the Queen and the country in properly directing her at the outset of her reign; but the opinion will be slightly modified now. In the enthusiasm of his devotion and service to his Sovereign he went too far. Clever, judicious, tactful, and with a mind accurately balanced far beyond her years, the Queen was after all but a young girl who needed the most careful direction. But Melbourne seemed determined to please her at all costs, even sometimes to the point of straining the spirit of the constitution. Thus not only did he make mistakes, but he led the Queen into them, and in at least one case she recognised in after-years that such a mistake had been made, the consequences of which were somewhat serious at the time, and might have been much more so. This was the historic case of the differences between the Queen and an incoming Ministry concerning the proposed changes in the Ladies of the Household. In the secret correspondence, criticising Ministers and advising her Majesty when he himself was no longer in office, that he kept up despite strong protests that were made, he was really almost wickedly wrong. The entire tendency of his influence was to magnify the sense of sovereign power in the mind of the young girl Queen. At this critical period of the monarchy—and nobody can deny that until the birth of the Prince of Wales it was critical—he would have lessened some of its limits, and he certainly prepared a great deal of trouble for succeeding Ministers who had to insist on the proper order of things. It is infinitely to the credit of her Majesty that in the long-run she had more good common-sense than this weak, amiable Melbourne, and afterwards suffered less from a faulty initiation to her duties as Sovereign than the great majority of other women, even clever women, would have done. Thus, on the whole, one cannot help feeling that it would have been far better if Peel and not Melbourne had been in power when she came to the throne. The grand result and excellence of her queenship could, indeed, not have been better, but the order of things would have been more regular and certain, and less would have been left to depend on the superior wisdom and judgment of the Sovereign.

Now look at some of these letters, and first of all consider some points connected with those difficulties that arose about the Queen's Ladies. This happened after her Majesty had had two years' official association with Melbourne. The Melbourne Government found itself obliged to retire, and how this threatened loss of her faithful friend and adviser affected her Majesty can best be understood from reading the letter which she sent to him the day after she had the news. It was as follows:

'BUCKINGHAM PALACE, 8*th May* 1839.

'The Queen thinks Lord Melbourne may possibly wish to know how she is this morning. She was in a wretched state till nine o'clock last night, when she tried to occupy herself and tried to think less gloomily of this dreadful change, and she succeeded in calming herself till she went to bed at twelve, and she slept well; but on waking this morning, all—all that had happened in one short eventful day came most forcibly to her mind, and brought back her grief. The Queen, however, feels better now; but she couldn't touch a morsel of food last night, nor can she this morning. The Queen trusts Lord Melbourne slept well, and is well this morning; and that he will come precisely at eleven o'clock.' . . .

Melbourne answered with a very proper kind of letter, in which he said that it was necessary for her Majesty to be 'prudent and firm.' The Queen immediately consulted in turn both Wellington and Peel about the formation of a new Ministry, and sent a full account of her conferences with them post-haste to Melbourne. She told him that she had raised the question of the constitution of her Household in her conversation with the Duke, who had wisely advised her not to begin with questions of that kind, but to wait until the matter was proposed. She told the Duke also that she meant to tell the new Government that she intended to see Melbourne often 'as a friend,' so that they might know there was no unfair dealing. The Duke assented. To Peel, when he in turn came, she said the same thing; but Peel intimated that he would require her to demonstrate confidence in the Government, and that the Household would be one of the marks of that. Continuing this letter to Melbourne, her Majesty said: 'He [Peel] is such a cold, odd man she [the Queen] can't make out what he means. He said he couldn't expect me to have the confidence in him I had in you (and which he never can have), as he has not deserved it. My impression is, he is not happy and sanguine. He comes to me to-morrow at one to report progress in his formation of the new Government. The Queen don't like his manner after—oh! how different, how dreadfully different, to that frank, open, natural, and most kind, warm manner of Lord Melbourne. The Duke I like far better to Peel. The Queen trusts Lord Melbourne will excuse this long letter, but she was

so very anxious he should know all. The Queen was very much collected, and betrayed no agitation during these two trying Audiences. But afterwards again all gave way. She feels Lord Melbourne will understand it, amongst enemies to those she most relied on and esteemed, and people who seem to have no heart; but what is worst of all is the being deprived of seeing Lord Melbourne as she used to do.' Melbourne again answered with excellent advice, suggesting that in the matter of the Household, after holding out as far as possible, she should if necessary give way to Peel's desires.

These desires had not so far been formulated. The position was this, that Melbourne had made the mistake in recommending to the Queen as members of her first Household ladies who were nearly related to himself and his Whig colleagues. Doubtless he did so for the soundest reasons, knowing these ladies better than others, and having the fullest confidence in them; but he overlooked the probability that the young monarch would form strong attachments to those ladies who were in her service first, and that if the appointments were not in the first place made under the influence of party spirit, yet the Whig tendencies of the ladies were likely to affect the Queen in the direction of allying her closely with that party, and that the case would become very difficult on the formation of a Ministry by another party, who would most naturally desire a change in the constitution of the Household. After first hinting to the Queen that it would be wise for her to defer to any wishes that Peel might express in the matter, the retiring Minister in his amiability seems to have reconsidered the question and endeavoured to accommodate himself more to the Queen's desires, though he knew they were impolitic and in a manner dangerous. Thus, writing another letter to her again the next day, he ignores the essential point as just explained, and speciously explains how Households were not changed on the occasion of the formation of other Ministries, and then says: 'They [Peel and his colleagues] press upon your Majesty, whose personal feelings ought from your circumstances to be more consulted, a measure which no Minister before ever pressed upon a Sovereign. If this is put to him by your Majesty, Lord Melbourne does not see how he can resist it.'

This was just what he ought not to have written. It was what the Queen wanted, and on getting it she set her teeth, and at nineteen years of age bade defiance to the soundest statesmen in the realm, not merely impeded but absolutely prevented the formation of a new Government, and brought about a crisis that had in it many features of danger. Both she and Melbourne probably discerned the immediate return of the latter to power as the result of Peel's determination and withdrawal. On the same day that Melbourne wrote this letter to her she wrote to him thus: 'The Queen writes one line to prepare Lord Melbourne for what may happen in a very few hours. Sir Robert Peel has behaved very ill, and has insisted upon my giving up my Ladies, to which I replied that I never would consent, and I never saw a man so frightened. He said he must go to the Duke of Wellington and consult with him, when both would return, and he said this must suspend all further proceedings, and he asked whether I should be ready to receive a decision, which I said I should; he was quite perturbed—but this is infamous. . . . I was calm but very decided, and I think you would have been pleased to see my composure and great firmness; the Queen of England will not submit to such trickery. Keep yourself in readiness, for you may soon be wanted.'

Various other letters passed between the Queen and Melbourne that day. Melbourne apparently became frightened at the turn that things were taking, and wrote that he 'never advised your Majesty as to what was to be done in such a case.' In her private journal the Queen wrote an account of the day's proceedings, including her interviews with Peel and Wellington. Peel said he only desired the removal of the Mistress of the Robes and the Ladies of the Bedchamber; to which her Majesty replied that they were of more consequence than the others, and she could never consent, and that furthermore it had never been done before. 'He said I was a Queen Regnant, and that made the difference. "Not here," I said, and I maintained my right. Sir Robert then urged it upon public grounds only, but I said here I could not consent.' The upshot was that Peel consulted his colleagues, and then informed the Queen that they had agreed unanimously that they 'could not possibly go on.' Melbourne thereupon advised her Majesty to return the following answer to him: 'The Queen, having considered the proposal made to her yesterday by Sir Robert Peel to remove the Ladies of the Bedchamber, cannot consent to adopt a course which she conceives to be contrary to usage, and which is repugnant to her feelings;' and her Majesty at once sent that message to Peel word for word, afterwards writing to Melbourne that 'the Queen was fully prepared, and fully intended to give these people a fair trial, though she always told Lord Melbourne she knew they couldn't stand; and she must rejoice at having got out of the hands of people who would have sacrificed every personal feeling and instinct of the Queen's to their bad party purposes. How is Lord Melbourne this morning?' Melbourne, of course, was re-established in power, but some of his chief supporters were alarmed at these happenings.

Thereafter the relations between the Queen and Melbourne were more cordial than ever. On 11th May she begins a letter with, 'The Queen is very anxious to hear that Lord Melbourne has not suffered from the ball last night, as it was very hot at first;' and on 12th May another one with, 'The Queen anxiously hopes Lord Melbourne is quite well this morning, and has not suffered from the dinner at Pozzo's.' Again: 'The Queen is really

quite shocked to see that her box was taken to Lord Melbourne to Park Lane, and she fears (by the manner in which Lord Melbourne's note is written) that he was at dinner at Lady Elizabeth H. Vere's when he got it. The Queen had imagined that the House of Lords was still sitting, and therefore desired them to take the box there, but never had intended it should follow him to dinner; she begs Lord Melbourne to excuse this mistake which must have appeared so strange. Did the dinner go off well at Lady Elizabeth H. Vere's, and were there many people there? Did Lord Melbourne go to Lady R. Grosvenor's party, or did he go home? The Queen hopes Lord Melbourne is quite well and not tired.' When Lord Melbourne did go out of office in 1841, the Queen ended a long letter to him in this strain: 'What the Queen felt when she parted from her dear, kind friend, Lord Melbourne, is better imagined than described; she was dreadfully affected for some time after, but is calm now. It is very, very sad; and she cannot quite believe it yet. The Prince [Consort] felt it very, very much too, and really the Queen cannot say how kind and affectionate he is to her, and how anxious to do everything to lighten this heavy trial; he was quite affected at this sad parting. We do, and shall, miss you so dreadfully; Lord Melbourne will easily understand what a change it is, after these four years when she had the happiness of having Lord Melbourne always about her. But it will not be so long till we meet again. Happier and brighter times will come again. We anxiously hope Lord Melbourne is well, and got up well and safe. The Queen trusts he will take care of his valuable health, now more than ever.'

Thereafter the wise influence of the Prince Consort began to be felt, and her Majesty soon got over her early antipathy to Peel, whom the Prince so greatly esteemed, and began to appreciate his excellent qualities. Melbourne, of course, never returned to office; but this was far from being the end of him and the difficulties for which he was directly or indirectly responsible. Soon after his retirement the Queen invited him to visit her at Windsor. Melbourne asked the Prince for his views about this, and the Prince sent for Stockmar, who made a memorandum which the Prince's private secretary, Mr Anson, was to take to Melbourne and read aloud to him. This memorandum suggested that while Peel was engaged in the difficult task of making his confidence with the Queen he ought not to be handicapped by any such unfair influences as this might be. Anson was given further arguments with which he was to accompany the reading of the memorandum, one of them having regard to a speech Melbourne had just delivered in the Lords which made the desirability of such an interview with the Queen at that juncture still less. We are told that 'Melbourne, who was then sitting on a sofa, rushed up upon this, and went up and down the room in a violent frenzy, exclaiming, "God eternally d—n it!" &c. "Flesh and blood cannot stand this. I only spoke upon the defensive, which Ripon's speech at the beginning of the session rendered quite necessary. I cannot be expected to give up my position in the country; neither do I think that it is to the Queen's interest that I should."' Anson told him plainly that the principal evil to be dreaded from the continuance of Lord Melbourne's influence was, according to Stockmar's opinion, that, so long as the Queen felt that she could resort to Lord Melbourne for his advice she never would be disposed (from not feeling the necessity) to place any real confidence in the advice she received from Peel.

But in spite of all protests Melbourne continued his correspondence with the Queen upon political affairs. Peel heard of it, and he said to Stockmar, 'On this I must insist, and I do assure you that that moment I was to learn that the Queen takes advice upon public matters in another place I shall throw up; for such a thing, I conceive, the country could not stand, and I would not remain an hour whatever the consequences of my resignation may be.' Moreover, about the same time it had been said to Stockmar publicly in a drawing-room, 'Don't you believe that Lord Melbourne has lost his influence over the Queen's mind; he daily writes to her, and receives as many answers, in which she communicates everything to him.' Stockmar thereupon resolved to take immediate action. About a month previously he had had a long conversation with Melbourne, in which he strongly advised him to tell the Queen that the correspondence between them must cease. He said that, as he (Stockmar) read the English constitution, it meant to assign to the Sovereign in his functions a deliberative part, that he was not sure the Queen had the means within herself to execute the deliberative part properly, but was sure that the only way for her to execute her functions at all was to be strictly honest to those men who at the time being were her Ministers. He added: 'It was chiefly on this account that I had been so very sorry to have found now, on my return from the Continent, that on the change of the Ministry a capital opportunity to read a great constitutional maxim to the Queen had not only been lost by Lord Melbourne, but that he had himself turned an instrument for working great good into an instrument which must produce mischief and danger.'

Now, after the drawing-room incident, and hearing what Peel had said, Stockmar wrote to Melbourne a long letter telling him very plainly what the situation was, and what was its danger. He practically put him upon his honour to cease an intrigue which was fraught with the utmost danger both to the Queen and the State. 'If ill-luck is to have its will,' he wrote, 'no human power can prevent an explosion for a day, or even for an hour. . . . What state will the Queen be placed in by such a catastrophe? That, in my position, portraying to myself all the consequences of such a possibility, I look chiefly to the Queen, needs

hardly, I trust, an excuse. . . . Can you hope that the Queen's character will ever recover from such a shock received by a collision with Peel, upon such a cause?' It only remains to be said that Melbourne after all did not cut himself off from this correspondence. It was kept up regularly for a long time; but after a little while, with the Queen gaining confidence in Peel, it gradually lost much of its political complexion and force, and assumed a mere personal and domestic aspect. This was by far the most serious episode of the kind in the Queen's reign, and at this time of day it is not easy to appreciate it at its full value. Towards the end of his life, when Lord Melbourne wrote to the Queen lamenting his poverty—which was not at all so bad as he thought it to be—she lent him considerable sums of money.

It might not be inappropriate to make a quick glance forward and quote very briefly from two other items of correspondence. In 1850 Lord Palmerston wrote to Lord John Russell: 'Is not the Queen requiring that I should be Minister, not indeed for Austria, Russia, or France, but for the Germanic Confederation?' This was *à propos* of Palmerston's anti-German attitude in regard to the Schleswig-Holstein case. On Lord John informing the Queen of Palmerston's view of things, she said in the course of her reply: 'The Queen does not wish her Minister to be Minister for Germany, but merely to treat that country with the same consideration which is due to every country on whose interests we mean to decide.' Some of her Majesty's correspondence with Palmerston is marked by a quite remarkable severity. Once in 1850 Palmerston had not made an alteration in a certain draft when he should have done so. She wrote to him: 'The Queen must remark upon this sort of proceeding of which this is not the first instance, and plainly tell Lord Palmerston that this must not happen again. Lord Palmerston has a perfect right to state to the Queen his reasons for disagreeing with her views, and will always have found her ready to listen to his reasons; but she cannot allow a servant of the Crown and her Minister to act contrary to her orders, and this without her knowledge.' Palmerston used to explain, Lord John Russell would intercede, and then the Queen would write to Lord John and complain strongly of the methods of his colleague. Thus Lord John in reply: 'Lord John Russell cannot but assent to your Majesty's right to claim every consideration on the part of your Majesty's Ministers. He will take care to attend to this subject, and is much concerned to find that your Majesty has so frequently occasion to complain of Lord Palmerston's want of attention.' Of course Palmerston had to be moved eventually, and the Queen was delighted beyond measure.

And this to finish with: 'As to the right of the Crown to declare war and make peace, it requires not a word of remark; yet Lord Stanley agrees to Mr Gladstone's proposal to make over this prerogative with regard to Indian questions to Parliament under the auspices of the Queen's Government; she is thus placed in a position of less authority than the President of the American Republic.' That was by the Queen in 1858 in a letter to Lord Derby.

A PAWN IN THE GAME.

CHAPTER XIV.—ON THE QUEST.

JEAN'S first business in Paris was to find out in which of its sixty prisons madame and Denise were, and day after day went by in fruitless search. All the usual means of help had broken down. Lord Gower, the English ambassador, had left Paris without waiting for passports. What diplomatic relations could be kept up with a king who had disappeared behind the doors of the National Assembly, leaving his guards to be massacred and his palace to be plundered? England was served ill at that moment by its secret agents, and those whom Jean approached were either afraid for themselves or jealous of him; they could—or would—give him no help.

Here was a Revolution not yet crystallised into a Government. It represented only an outbreak of distracted passion. The Assembly was under sentence of death; the Convention was not yet born. The one visible governing force was the Commune. Danton was Minister of Justice—if 'justice,' indeed, survived in the storm-shaken atmosphere of the distracted city. The terrible Committee of Public Safety, with Marat preaching massacre as its 'conscience,' had not yet emerged.

Paris was a distracted cave of the winds, of winds blowing from very black depths. Black anger was fermenting in every street, with terror for twin-sister. And there is no other human passion so cruel as terror.

The fear shaking all the nerves of Paris—that city of nerves—at the moment seemed, it must be confessed, to have some reason for its existence. The city, so to speak, was on tiptoes listening for the sound of hostile guns beyond the horizon; the guns of the Prussians at Longwy, of the Austrians at Thionville, or of Brunswick (with an army of seventy thousand, it was even whispered of twice that number) marching through the Argonne Passes on Paris. France was girdled with fire. Vendée was rising. In Paris itself, as terror whispered, there were thirty thousand aristocrats not yet in prison.

The gay, guilty, passion-torn city felt itself hurrying on to some dark and unguessed fate. The very air seemed shaken with strange sounds. It tells the mad nature of the times to remember that if the representatives of the sections set the blade of the guillotine moving fast, their own necks in turn went beneath its stroke. Of the hundred and forty-four members of the first Commune, no less than ninety-six—or two out of every three—perished by the guillotine. The Revolution devoured its offspring quickly in those days.

Amid these wild scenes and the play of these strange forces Jean wandered with a sense of helplessness. He watched from the pavement the doors of the Hôtel de Ville, and tried to recognise the figures that passed in and out, for all authority at the moment was in their hands. He saw there, once, the dark face of Duclos, looking more darkly mysterious than ever. Lepitre, too, with a tricoloured sash round his waist—he recognised him by his goggle eyes. Jean had a kindly feeling for his old teacher, but he knew Lepitre was not to be trusted.

The third day, however, Jean saw Toulan, with official scarf and an air of authority, coming down the steps of the Hôtel de Ville. He liked the talkative and impulsive Southerner in spite of his restless eyes. His temper was daring. He had no concealments. He might refuse to help, but he would not betray. Jean made inquiries, and found that Toulan had given up his shop and become an active member of the Jacobin Club, where his fearless temper gave him great influence. He had been elected a member of the Commune, and was one of the leaders in the attack on the Tuileries. He had an office in a narrow and winding lane near the Hôtel de Ville.

Jean watched outside this office one morning till Toulan emerged, then, following him, touched him on the shoulder. Toulan swung sharply round, almost as if the touch of Jean's finger had been the prick of a sword, for French nerves were sensitive in such times. His quick eyes ran swiftly over Jean's face and figure.

'The Englander!' he cried.

Jean nodded, with a smile, in answer.

'What are you doing here?' asked Toulan suspiciously.

'Not conspiring against the Commune,' Jean replied with a laugh.

Toulan had been scrutinising him. 'No; you are honest; you always were honest. You have not brains enough for a conspirator,' he added with a laugh, for Jean's face wore once more its mask of dullness.

'Madame,' said Jean, by way of explanation, 'has been arrested.'

'And does that distress you? She was no friend of yours. She was always a Girondist, and she was accused of meddling with Royalist plots. The Republic must strike its foes.'

'But Denise,' said Jean quietly—'she, too, is arrested. Does the Republic make war on children?'

'No,' said Toulan with a curse. 'That little one! What fool sent her to prison?'

Toulan was, in his hot, Southern fashion, keenly sympathetic. He trusted Jean, and readily undertook to find out in which of the prisons madame lay.

'She is in the Abbaye,' he told Jean when they met next day. 'Your old enemy M. Duclos turned against her when her money was gone, and betrayed her.'

Toulan shook his head decisively when Jean asked if he could obtain an order to see madame. The days of careless guard and of easy access to the *detenus* were gone. Every prison-door in Paris was guarded at that moment by stronger bars than iron. Suspicion and hate kept watch there, and darker shapes than even these. If Jean applied for an order to visit madame the application would be taken for a proof of sympathy, and he would himself be promptly arrested.

Toulan, however, was willing to help Jean as far as possible. He supplied him with a civic card—of red, as an inhabitant of Paris; not of white, as a stranger—which any patrol might require him to produce, and without which he could sleep in safety under no roof in the city. Toulan warned him, too, that on an afternoon which he named every house in Paris was to be searched. All citizens were required to be within doors till the officers examined the rooms in each house. A net with meshes so fine that no fugitive could escape was to be flung over the whole city. But Toulan explained that as he was himself to conduct the search in the quartier where Jean lodged he would be safe.

Paris has seen strange sights, but not many stranger than it saw that afternoon. All traffic ceased; the streets were silent and empty. The population of a whole city sat under its roofs waiting inspection.

Jean sat in his room till, with sharp rattle of drum and tramp of feet, the search-party came down the street, examining each house in turn. Presently the searchers came to the room where he sat. Toulan was at their head.

'I know this citizen,' he said in a peremptory voice, 'and will answer for him;' and the searchers went on their way.

Jean's problem was how to communicate with the prisoners in the Abbaye, and over this puzzle he meditated for days. He trod the filthy pavements in its neighbourhood till he grew footsore. He hung round its gate watching—with eyes sometimes dim with pity, but more often keen with anger—the little groups of 'suspects,' haggard men and pale-faced women, being hurried in, till he began to wonder when the sad procession would end. But no chance of communicating with madame and Denise offered itself, and more than one rough chal-

lenge showed Jean he was beginning to attract suspicion to himself.

At last there shone a gleam of hope. Watching outside the great prison one morning, Jean saw an official coming through the gates. It was a shambling figure, with legs disproportionately short. In the rodent-like face, with its pointed chin and eyes set close together, and generally furtive air, there was something familiar. A second glance showed Jean that it was his old acquaintance the Rat.

Jean followed him along till a quiet part of the street was reached; then, quickening his steps, he whispered in the Rat's ear the once familiar password of his band. The Rat swung round, and as his ferret eyes dwelt on Jean's face there broke out in them a light of gladness and even of affection.

'*L'Anglais!*' he cried.

'Yes,' said Jean with a laugh. 'And what has become of the Rats?'

They had, it seemed, broken up. Their leader explained he had taken to politics, and the lessons he had learned in the forays and stratagems of the Rats had served him well in this new field. He was, he proudly said, one of the more important officers in the great prison.

'Madame is there?' asked Jean eagerly.

'Yes, she is there; but you would not know her. Her hair has turned white. She is ill. I think she's dying.'

'And Denise?' asked Jean with a beating heart.

'Ah, the brave little one!' said the Rat. 'She takes care of her mother.'

When Jean suggested that he might obtain access to the prison the Rat shook his head energetically. No visit to the prison was possible for Jean except as a prisoner. He knew his influence over the Rat, and exerted it to the utmost, but in vain. He would carry a note to Denise, but it must bear neither name nor address. He would permit Jean only to write a few impersonal and colourless syllables that could arouse no suspicion.

Jean wrote the letter with the hope that Denise's quick wit would guess from whom it came; but he was struck with the Rat's disquiet as he talked of the prison, and it left on Jean's mind the sense that some tragedy was gathering over the gloomy building and the prisoners within its walls.

(To be continued.)

A CHAT ABOUT DREAMS.

By Dr Andrew Wilson.

THE subject of dreams forms a never-ending attraction both to scientific minds and to the lay public. The man of science studies dreaming from the point of view of the brain-expert, and has regard to the possible explanation to be drawn from physiology respecting the origin of the visions of the night. The public attitude towards dreams varies. In some cases they are still treated as harbingers of fortune or of disaster as the case may be; in others they are simply dismissed, without the arousing of curiosity, as brain-vagaries undeserving of notice.

We may readily understand why a large accumulation of superstition should still envelop the dream in the eyes of many persons. From the earliest periods of human development dreams have entered more or less intimately into man's conceptions of religion, and they have afforded ground for beliefs regarding a future state, and concerning even man's own personality, such as moulded in no small degree the attitude of nations towards the powers to which they attributed the governance of the universe at large. The North American Indian, who believes that in his dreams his spirit leaves his body and wanders forth at will, returning to his frame when his repose ends, illustrates one phase of the influence of the dream on man's personality. Dreams as portents and omens have figured all throughout history, sacred and profane. The coming event which casts its shadow before is perhaps better typified by the dream than by any other phase of life. There is a link to be clearly perceived, striking as the thought may be, between the auguries of old founded on the visions of sleep and the servant-maid who in order to read the supposed meaning of her disturbed slumbers purchases and studies a penny 'dream-book.'

It is true we can only regard the dream, scientifically considered, from a distance, as it were. We are unable to determine the exact causation of dreaming in so far as the mechanism of the brain responsible for its evolution is concerned. But a knowledge of the general details of brain-work leaves us in little doubt concerning the mode in which dreams are produced, and any study of the subject, to be satisfactory at all, must take cognisance of the details in question. The constitution of the brain, briefly regarded, forms the starting-point of all discussion here. We have first of all to take into account that the brain is not a single organ. On the contrary, it is a congeries of 'centres,' to use a familiar term, each centre composed of brain-cells, and these cells representing the governing units of our frame. Now, brain-cells, and necessarily the centres they serve to form, are not by any means of equal value or importance in the work of bodily regulation. We have higher and lower centres, some representing, for example, the instruments of thought and intellect, others

deputed to discharge inferior, if necessary, duties, such as the stimulation of muscles to action or the control of the bodily processes and actions—such as the beating of the heart and breathing—on the due continuance of which life itself depends. Intermediate between these groups of centres we have others whose mission it is to receive the messages which eyes and ears and other sensory organs convey to us from the outer world. The principle of the division of labour is thus perfectly represented in the brain and its working; certain groups of cells, in other words, being set apart for the performance of special duties. Beyond this general statement of the constitution of the brain, we may proceed somewhat further. When we come to consider the higher centres of the brain we note again a difference in the cells whereof these centres are composed. It is, at least, an inference warranted by all we know of brain-action that among the higher centres there are some cells of supreme importance and others to which an inferior position must be assigned in respect of the work they perform. We see this fact demonstrated in the case of many familiar actions. For example, automatic acts or those we perform in the absence of any distinct manifestation of the higher consciousness are common enough. Reading and writing, which involve close attention at the beginning of life when education commences, and which keep the child's attention closely engaged, become in time purely automatic acts. In early life we have to consider the shape of each letter, its sound, and also the significance and spelling of every syllable. The child asked to write a word will have to consider at first the formation of the letters and their sequence. To him this represents an intellectual labour; but later on, when he has learned to read and to write, there is no hesitation over any of the details which puzzled him at a previous stage of his studies. He writes or reads at will, without having to consider any of the points that gave him concern when his education began. Many other illustrations might be adduced of this conversion of intellectual operations into automatic or machine-like ones. The things we 'get off by heart,' to use the schoolboy's expression, are those which, repeated freely, and in most cases unconsciously, exemplify what is really a tremendous saving of intellectual power. If we had continually to be thinking of the simplest actions involved in our daily life, existence would become a trial and a bore to us. Just as we do not concern ourselves about keeping our heart beating or our lungs in action, or just as the digestion of our food is all carried on without any intellectual or conscious effort, so in the higher work of the brain itself automatism is thoroughly represented. So true it is that in reality much of our life is regulated not by us but for us. The natural, machine-like regulation we see illustrated in our bodily rule extends likewise to many actions in which the brain itself is intimately concerned.

Applying these considerations to the explanation of dreaming, we note, first of all, that when we lose consciousness and all sense of our individuality in sleep, there remain on night-duty, as it were, a considerable number of brain cells and centres whose action persists when the highest centres are thrown out of gear or switched off. Psychologists have given to the dim underfield of brain action which thus persists when otherwise we are in the hands of 'the ape of death' the name of 'subliminal consciousness.' This last is the result of the stirrage or work of brain-cells which, kept in control in the waking state by the higher centres, are left free to run riot in dreams. It is as if, contemplating the calm sea, we become aware of undercurrents that showed no sign of their existence on the face of the waters. It is not in dreaming alone that the action of this underlying consciousness manifests its existence and its power. If we think of the somnambulist or sleep-walker, we see how the unconscious body can be roused up to walk about and even to perform actions apparently of ordered kind under the guidance of these deputies of the higher and sleeping centres. So that, on the face of things, it is impossible to doubt either that we do possess a layer of half-consciousness, so to speak—or at least of secondary brain-action—or that it is in this mental region that we must look for the more or less relevant stories they tell us in dreams. The question whether there can be dreamless sleep at all has been warmly debated by physiologists. Some maintain that dreamless repose is possible; others hold that dreaming is always represented, and that dreamless sleep is to be explained on the theory that we forget many dreams, or rather that many visions have never succeeded in impressing themselves on the centres charged with the exercise of recollective powers. There can be no settlement of the point at issue here, so perforce we may be left to suppose that dreaming is a natural phase of existence, albeit it is one that is much more typically represented in some persons than in others.

The study of dreams has led to attempts to classify the visions of the night, a task this unattended with success. The character of one's dreams partakes as a rule of the nature of a person's daily work and avocation; at least, his most vital interests will occupy, as a rule, a prominent place in the stories his under-consciousness constructs during the night. This point can be proved, I think, by the fact that if we take the trouble to analyse our dreams we may often trace their origin to some incident of life and work not necessarily occurring the day before, but sometimes revived in and by our memory-cells, as, for example, when we dream of persons long dead and events which occurred years ago. Once upon a time I was responsible for the due appearance of a weekly journal. My editorial work has ceased for years, but now and then I experience a dream of which

the leading feature is the agonising certainty that the paper will not be ready in time, and that the fate of the journal has suffered in my hands. This dream is merely an echo of editorial anxiety long vanished away, but still existent as a dormant idea in some collection of the brain-cells which delight to construct fiction in the night-watches. The dream can very often be traced to some trivial incident of the waking life which forms the starting-point of the dream-story. A thoughtful review of what we have been doing or saying or reading will often supply the clue that leads us to the causation of a dream. But the main point to be borne in mind regarding dreams is that each dream is a story which the subliminal consciousness has constructed around some incident or even some thought of our waking period. True it is that some dreams are realistic and sensible enough; for the most part, however, they are unreal, and exhibit silly and foolish details overlying and often concealing the nucleus of the tale the brain has constructed. It is as if the secondary consciousness does not possess the power of making a really effective story true to life. It begins well, but more than often the dream-tale goes off at a tangent and ends in an inconceivably ludicrous and senseless fashion. I believe in this thought that the dream has to be built up and constructed, lies the true explanation of the essence of all dreaming. The centres that represent the night-shift of brain-workers have only a limited responsibility, and their constructive powers are similarly circumscribed. They try to ape the work of the higher centres which are asleep, and they miserably fail as a rule. With dreaming, as with mesmerism or hypnotism, we might compare the sleeping and also the hypnotised body to a ship the captain of which has gone below and left an untutored hand in charge on deck.

If dreams may thus be regarded as resulting from the action of lower brain-centres endeavouring to construct stories founded usually upon a basis of fact, and often failing miserably in the attempt, we see that the death-blow must be given through such considerations to all the popular superstitions which attach to dreams and dreaming. The old Latin who said that if men did in waking life what they were supposed to do in dreams the world would be mad indeed, expressed a highly rational view of our night-visions. We may meet at every turn with stories of dreams that have apparently forecasted events. But there is such a thing as coincidence in the world, and very frequently such dreams are to be explained—when they are not grossly exaggerated in details—on the ground that the events said to be foretold are precisely of a kind which were likely to engage the attention of the dreamer. A dream of a shipwreck not unnaturally forms a frequent type for the brain-play of an anxious mother with a son at sea. Wrecks do occur, and a coincidence merely in point of time is held to be one of actual prophetic nature. Thus we may relegate dreams to the category of brain-vagaries, natural perhaps, but eccentric enough in their free play when all control is removed from the centres responsible for them. And if there are those who ask why some dreams come true, one might retort with the pertinent question, 'What about all the dreams that don't come true?'

TONELLI'S GOLD.

CHAPTER IV.

N the dusk of the afternoon succeeding the morning on which Amata had said on awaking, 'Only three more days and Stefano will be here,' as she sat alone in the house—Neri's wife having her own domestic affairs to attend to—she was roused from a fit of musing by the tinkling of the bell as some one opened the shop-door and entered. At once Amata rose and passed from the living-room into the shop. By the faint light she could just make out the figure of a woman who was carrying a child in her arms.

'Can you tell me, please, whether Miss Tonelli lives here?' asked the woman, with a quaver in her voice.

'My name is Amata Tonelli.'

'May I ask whether you are acquainted with one Stefano Santi?'

'As a matter of course I am acquainted with the person named by you. He is my cousin.'

A long-drawn 'Oh!' of surprise broke from the woman. After a momentary pause she said, 'Then he does not come here to make love to you?'

The question was so unexpected that for some seconds Amata was too taken aback to reply. Then in a strained voice she said, 'Why do you ask that?'

'Because, miss, you and he have been seen about together at theatres and music-halls and such like. I put my brother Jack on to track Stefano, and that's what he reported to me.'

'You put your brother on to track him! But why—why? What concern of yours is it how Stefano Santi chooses to pass his time?'

'I thought he was maybe making love to you—I know what a scoundrel he is at heart—and that if such were the case it was only right you should be told he has a wife already.'

'A wife already!' It seemed to Amata that she echoed the fateful words aloud, but in reality no

sound passed her lips save a low, strangled cry. She felt as if a dagger had suddenly been thrust into her heart, and as if she were doomed slowly to bleed to death. In the dusky shop the woman's dimly outlined figure appeared to the girl's excited fancy to have no more bodily substance than a figure seen in a nightmare from which she should presently awake. Some seconds—seconds which seemed minutes—passed, and then a flash illumined her brain.

The child!

Still in silence, she put forth her hand, felt for, and found a box of matches. Having struck one, she lighted a gas-jet, and then the two were enabled to take stock of each other.

Amata saw before her a tall, thin, anæmic-looking woman, with some remains of a wax-doll kind of good looks. She had rather watery big blue eyes, a weak chin, and a mouth expressive of a peevish and querulous disposition. She was wearing a lot of cheap finery, and her cheeks were profusely powdered.

In her turn, the woman stared at the Italian girl as if fascinated. Rarely, if ever, had she set eyes on so beautiful a creature, although in the course of the last few minutes every vestige of colour had faded out of Amata's face, leaving it of a death-like pallor, which, however, merely served to intensify the sombre fire with which her eyes glowed as if lighted up from within. She was crowned with the heavy coils of her dead-gold hair, and was wearing a black gown of the simplest material and make.

'So *you* are the wife of Stefano Santi?' said Amata at length, with a calmness and a seeming indifference which surprised herself.

The woman bowed assent. 'I've brought my marriage-lines, miss, if you would care to see them.'

Amata seemed not to have heard her. 'And the child?' was all she said.

'Ah, my Luigi! You have only to look at his face, miss, and you won't need to ask his father's name,' replied the woman, as she set down the child, who, with averted eyes, had been gazing over her shoulder at the stuffed alligator.

As he now turned towards her Amata involuntarily recoiled a step, so startling was his likeness to Santi. Her right hand went up quickly to her bosom and stayed there for some moments.

'How old is he?' at length she contrived to ask. Her eyes seemed to devour him.

'Two years and six weeks, miss.'

'I suppose your husband thinks a great deal of him?'

'He regards him as the apple of his eye. Save Luigi, I don't believe there's a soul in the world for whom he cares a button. Were he to lose the boy it would go near to break his heart.'

'So!' whispered Amata to herself, with an indrawing of her breath. For a few moments there was silence; then she said, 'Has your husband never spoken to you about his cousin Amata Tonelli, or about his uncle, my father, who died less than a fortnight ago?'

'Never, miss, and that's the solemn truth.'

'He treats you with kindness?'

'Kindness!' exclaimed the woman with a harsh laugh. 'He was kindness itself while my little fortune of seven hundred pounds lasted. When that was gone—— But it will be enough to say that more than once he has knocked me down with a blow of his fist.' Again she laughed. 'Of course he married me for my bit of money, while I was gaby enough to believe it was for my looks. He just fascinated me, and that's a fact; and it was my fear lest he might be doing the same by you—for I know his carneying ways—that has brought me here this evening.'

'You need be under no fear whatever on that point. Although he and I have been out together several times, I give you my word that Stefano Santi is no more to me in the way meant by you than the merest stranger who ever sets foot inside this shop.' Her tone had in it a sort of icy, concentrated bitterness which carried conviction to her hearer's heart.

'I'm glad of that, miss—very glad indeed. You've set my mind at rest.'

'Do you still love your husband?' asked Amata abruptly. She scorned herself for putting the question, but was unable to refrain from doing so.

'I hate him,' replied the woman, and an evil light leapt into her eyes. 'What love I ever had for him was killed long since by his treatment of me. If he were to die to-morrow I should not shed a single tear. I should then be free to wed my first love, whom I jilted for Santi's sake, and who is still unmarried.' She finished with a complacent smirk.

Amata experienced for this powdered, tawdry being a mixture of repulsion and pity. It was impossible not to feel grateful to her for having unsealed her (Amata's) eyes, how cruel soever the awakening might be; but, now that her tale was told, the girl was possessed by a sudden longing to be rid of her presence. She wanted to be alone—alone to think over and strive to realise in all its bearings the tale that had just been told her.

'You must leave me your address,' she said, 'so that I may know where to find you in case I should want to do so.'

So the other mentioned an address at Upper Holloway, which the Italian girl's memory would not fail to retain.

All this time Amata's eyes had been more taken up with the child than with his mother; but the boy had now buried his face in his mother's skirts, as if something in the eyes of the white-faced woman who stared at him so persistently had begun to frighten him.

Two minutes later mother and child were gone.

Amata went back to the inner room, and stood for a long time as motionless as a statue, staring down into the fire but seeing nothing of it. Throughout the late interview she had been subconsciously aware of a certain creepy sensation which, as it now seemed to her, could only have been due to one cause: the presence of her father's spirit, which had been there, invisible to mortal eye, and had overheard all that was said. If only he were permitted to whisper one word into her ear, what would that word be? Why, of a surety, 'Revenge!'

In the composition of Amata Tonelli the elemental passions of love, hate, and revenge lay very close to the surface, and that Stefano Santi should be made to pay other than dearly for the deadly insult he had put upon her was a thought that never entered her mind. The possibility of simply dismissing him, of sending him ignominiously about his business, would have been regarded by her with incredulous scorn. Her soul would know no rest till she should have avenged herself on her traitorous cousin. She smote herself on the mouth for having let her lips be kissed by him and for having kissed his in return.

To see her moving about the house with white, set face no one would have suspected what volcanic fires were at work below that quiet exterior. Neri's wife, looking on with thoughtful eyes, said, 'It is not well that the young should mourn over much for the old. They have had their day, and that is enough.' Of Santi's existence she knew nothing.

Next morning's post brought a letter addressed to Tonelli, which Amata opened. It was from Santi, was written in Italian, and ran as under:

'My dear Uncle,—I intend leaving Berlin by the morning train on Wednesday, and shall reach London at eight A.M. on Thursday, where the business you know of will occupy me for several hours. Look to see me about ten o'clock on Friday morning.

'All has gone well. I send a hundred kisses for my darling Amata.—Your affectionate nephew,

'Stefano Santi.'

Amata tossed the note contemptuously into the fire. 'Ah, Stefano *mio*,' she muttered, 'you little dream of the knowledge that has come to me while you've been away, or of the vengeance awaiting your return!'

That evening a cab took her to the address at Upper Holloway, where she had a long interview with Santi's wife.

(To be continued.)

THE NEW RIVIERA.

THE LEVANTINE RIVIERA.

By Eustace Reynolds-Ball, Author of *Mediterranean Winter Resorts.*

IN TWO PARTS.—PART I.

REGULARLY with the approaching winter the tide of fashion sets steadily southward, the main current of winter colonisation flowing in a somewhat restricted channel, bounded on the west by Cannes and on the east by Mentone—the district popularly, if loosely, termed the Riviera.

There are, however, at least three Rivieras, which may be conveniently described as the French, the Italian, and the Levantine Riviera respectively. It is, however, with the comparatively new and undeveloped Levantine Riviera that I am now concerned.

No doubt with the ordinary winter migrant the French Riviera will long maintain its popularity. That it is hackneyed, commonplace, and overcrowded, and that the season at Cannes or Nice is little more than an aftermath of the London season, would not be disputed by its patrons. But what other region offers so wide a choice of pleasant winter quarters, with such a genial and sunny climate within a day's journey from London? Excellent communications, congenial society, the finest hotels in the south of Europe—all these things naturally attract the class of visitors who have made Nice and Monte Carlo the winter pleasure-cities of Europe. These towns appeal, in short, to those who do not care about potential or experimental winter resorts, however great their scenic attractions.

There are, however, a large number of visitors who would prefer less banal and conventional winter quarters than those of the south of France, and yet have not the means or leisure to cross over to Algeria or Egypt. The demands of this class are modest enough. They want a watering-place tolerably accessible, a sunny climate, hotels with a reasonable tariff, interesting scenery, and pleasant, but not necessarily fashionable, society. Given these conditions, they would willingly forgo the social attractions and urban resources of Cannes or Nice.

Formerly the Italian Riviera to a great extent fulfilled these requirements; but its principal winter stations, Bordighera and San Remo, are fast losing their individuality, and have become almost as conventional as the popular French resorts. Hence the vogue of the newest winter-land on this coast—the Levantine Riviera, extending from Genoa to

Viareggio—especially with the following classes: (1) artistic and literary people, who dislike the banality and frivolity of the typical foreign winter resort, that class the time-honoured *Murray* was wont to describe as 'intelligent travellers;' (2) families who want quiet and salubrious winter quarters; (3) those on economy bent, who want to spend a winter holiday as cheaply as is consistent with comfort and dignity.

Climate, of course, is a matter which closely concerns the comfort of visitors. To ordinary tourists, as distinct from those wintering abroad for their health, a good climate simply means a maximum of sunshine. Though in this respect it must be admitted the eastern Riviera is inferior to the western, yet some weeks of continuous sunny days can usually be reckoned upon. The chief characteristics of the climate are, briefly: a mild and equable temperature, plenty of sunshine, and absence of winds. If the meteorological records show a greater rainfall than in the French Riviera, the frequenters of the Levantine winter stations can plume themselves on escaping that combination of bright sunshine and cutting winds which makes Nice and Cannes so trying to delicate persons.

Though the topographical features of this coast seem on the map to be very similar to those of the western Riviera—a long strip of littoral backed by a range of high mountains—yet the character of this huge mountain-screen is different. Instead of a background of rocky precipices, which make the warmest stations of the south of France—Beaulieu and Monte Carlo, for instance—perfect sun-traps, the rocky face absorbing the heat and acting like a gigantic espalier wall to the towns it screens, the hills along the Levantine Riviera are for the most part thickly wooded and covered with luxuriant vegetation. Consequently there is sufficient protection from the *tramontana*—the counterpart of the *mistral* of the French Riviera—without the perpetual dazzling glare which many visitors to Monte Carlo or Nice find so irritating.

The winter resorts, actual or potential, of this eastern Riviera may be conveniently divided into: (1) the Genoese resorts—Pegli, Sestri Ponente, and Nervi; (2) the Spezian resorts—Rapallo, Santa Margherita, Portofino, Sestri Levante, Levanto, and Spezia; (3) the summer bathing-places near Leghorn—Viareggio, Leghorn, and Ardenza—whose great merit is their cheapness in the winter, the off-season.

The places in the first category can be dismissed in a few words. They are rather suburban in character, expensive, very much modernised, and German visitors largely predominate. Indeed, the Teutonic influence obtrudes itself unpleasantly even at the hotel *table-d'hôte*, sausages and an Italian variant of *Sauerkraut* being staple dishes.

Pegli is only six miles from Genoa, and there is constant communication by electric tram with the city of palaces. Indeed, it is to Genoa what Ramleh is to Alexandria—a popular holiday-place for its citizens. All travellers know the great sight of the place, the extraordinary landscape-gardening of the freak order of the Villa Pallavicini, regarded by the ordinary globe-trotter as a triumph of art over nature, while those of æsthetic proclivities are apt to scoff at the Pallavicini wonder as a kind of sublimated tea-garden.

Sestri Ponente is little more than a manufacturing suburb of Genoa, and is not well suited for a winter residence. East of Genoa we do not begin to shake off some of its all-embracing tentacles in the form of half-finished 'mean streets' of the progressive and expansive city till we reach the small retired villages of Quarto and Quinto, where we shall find comparatively rural and cheap winter quarters.

A mile or two farther is Nervi, which is in high repute with German doctors as an invalid resort. It is a very sheltered place, the climate resembling that of Mentone, and the walks and drives in the well-wooded hills are pleasant and varied. The hotels are among the best on the Riviera; but the town has never been really popular with English visitors, partly because it is as aggressively German as Pegli or Sestri. Delightful in many respects as German travellers are, it cannot be said that as fellow hotel-guests they are cordially welcomed by our compatriots.

We are now approaching the *clou* of the scenery of this beautiful coast. The landscape is full of charm, though perhaps less bold and 'romantic' than that of the well-known French Riviera. The hills are richer in vegetation and colour, but they lack the startling contrast of alpine and subtropical landscape, and the picturesque outline of the precipitous mountain wall which shuts off the hinterland of Nice and Monte Carlo, and helps to make that section of the famous Corniche Road the finest drive in Europe. The luxuriance of the vegetation must strike the least observant of tourists. In particular, the country round Sestri Levante and Rapallo is one series of gardens, orchards, olive and chestnut groves, while occasional spiky aloes and feathery palms give a tropical touch to the view.

But to appreciate the scenery it is necessary to forswear the railway, and to drive, ride, or walk. Only the briefest tantalising glimpses of the beautiful landscape are obtainable between the innumerable tunnels; there are some fifty between Genoa and Spezia, while between Sestri Levante and that port it is scarcely an exaggeration to say that the train is more frequently under than above ground. Out of one tunnel, a rapid glance through a ravine skirted with olive groves apparently terminated by a picturesque old village; another tunnel, then a cinematograph view of the sea sparkling below in the sunlight; a shriek from the engine, and another plunge into darkness. This, in short, is the epitome of the railway journey along this coast; indeed, at

a certain wayside station the passengers can see the engine at the opening of a tunnel, with the guard's van scarcely clear of the one just left. 'We get a general impression of steep hills broken by gorges or mountain streams, craggy promontories and sheltered coves, villages (sometimes perched on an outlying peak, clear-cut against the blue sky, or hidden in a ravine, distinguishable only by a campanile); ruined towers mount guard on some of the precipices; then a streak of meadow or olive-decked slopes thickly clothed with myrtle, arbutus, tamarisk, and pine scrub.'

Santa Margherita, ten miles from Nervi, might be regarded as a satellite of its prosperous neighbour, Rapallo. It lies in a pretty situation on the shores of a sheltered bay at the foot of olive-clad hills. The hotel accommodation, formerly very deficient, is now satisfactory, two good hotels having recently been built. Some years ago the faulty sanitary condition of Santa Margherita excited some adverse criticism; but since then the drainage has been improved, some attention has been paid to the water-supply, and the town is considered tolerably healthy. The suspicions of defective drainage naturally checked the development of the town as a place of resort for visitors, and its rival, Rapallo, has gained thereby. Then the aspect of Santa Margherita is not so desirable, at all events for delicate people, as that of most of these Levantine watering-places, as it faces east.

Rapallo is little more than a mile from Santa Margherita. Its situation is extraordinarily beautiful even in this land of 'beauty spots,' and many will agree with the late Grant Allen, who considered the town the most beautiful along the whole of this littoral from Genoa to Viareggio. It boasts, too, of a very respectable history, holding in medieval times a position in Liguria that Amalfi did in south Italy. Indeed, the early history of Rapallo and Amalfi have much in common, each being in their prosperous days the mother-city of a republic on an equal footing with Genoa, Pisa, Venice, and other powerful Italian states. The great number of churches and convents, hospitals and palaces, in Rapallo—no town in north Italy, indeed, has so many churches in proportion to its population—is some indication of the historical importance of this famous port, which fills many pages in the medieval history of Italy. Many great names are associated with the town, from Pope Alexander III. to Victor Emmanuel I., while the noble families of Doria, Spinola, and Fieschi dominate the local records in as marked a degree as at Genoa.

But though Rapallo is the most 'historical'—if the word admits of a superlative—town of any of the winter resorts along this littoral, it has many claims to the attention of the ordinary holiday-maker as well as the sightseer. Indeed, its mundane resources and attractions are considered by some of its old patrons to be unduly obtruded. Rapallo, in fact, has been much exploited of late by capitalists, and has undergone an hotel-building 'boom.' Now it boasts of a miniature casino (with the usual accessories of concert-room, billiard-room, card-room, &c.), a weekly newspaper, several hotels on the approved Swiss model, and even English tea-rooms. The ambitious character of the hotels is indicated by their names—Royal, Kursaal, Savoy, Metropole, and even Imperial Palace. Fortunately, owing to the competition, the prices are not commensurate with their pretentious nomenclature.

There is one serious drawback to Rapallo as a winter station. Owing to its rapid development, the sanitation has not kept pace with the accommodation for visitors, and the primitive arrangements for drainage which sufficed for a small town are utterly inadequate for a popular resort with half-a-dozen large hotels crowded with foreign visitors. This is certainly a matter which should be seriously taken in hand by the local authorities.

Till within recent years it was the boast of the frequenters of this beautiful resort that it was one of the few residential places on this coast which had not been vulgarised by monstrous *hôtels de luxe* and glaring stucco villas. These severe critics can, however, find a comparatively unspoilt haven of refuge at Portofino. It is true that even here is now a large modern hotel; but the artistic traveller will still find at the little local inn, Albergo della Stella, plenty of local colour and atmosphere, if little else. Picturesque in the extreme is the situation of this little port, the houses apparently springing sheer from the quayside, pushed almost into the sea by the thickly wooded hills. The church, with its graceful campanile, composes well in the picture. Altogether there is a suggestion about Portofino of an Italian Clovelly or Lynmouth.

The Portofino peninsula, though of inconsiderable extent, offers great variety of seascape and landscape, its physical features presenting a kind of epitome of the typical scenery of Italy. It would well repay a week's exploration amongst its hills and valleys, precipices and ravines; while, in addition to its scenic attractions, there is much to interest those fond of historical topography. In this picturesque, self-contained region, which seems quite shut off from the rest of the Riviera, are scattered many historical relics in the shape of monasteries, churches, shrines, and castles.

The monastery of Cervara, now a Roman Catholic seminary, was once the prison of Francis I. of France, who was confined here after the disastrous battle of Pavia. On the wall is inscribed the famous saying, '*Tutto perduto fu salvo l'onore*' ('All is lost save honour'). This affords a striking example of the tendency of tradition to improve upon the original of historic sayings. What the captive Sovereign actually wrote was, '*Ne m'est demeure que l'honneur et la vie qui est sauve*,' and this has certainly not the epigrammatic vigour of the legendary aphorism.

A couple of miles west of the Cervara, reached by a mule-path over the hills, is the dismantled monastery of San Fruttuoso. This is the burying-place of the Doria family—a group of Gothic tombs in good preservation.

The famous pilgrimage-church of San Giorgio, built on a strikingly picturesque site opposite Portofino, offers a curious example of a deposed saint. The church was originally dedicated to San Giorgio, the lesser saint, a companion of San Fruttuoso; but when the church acquired, during the First Crusade, the ashes of the famous St George of Cappadocia, the inhabitants did not hesitate to transfer their allegiance to the more celebrated saint. We as Englishmen will perhaps excuse this invidious example of popular canonisation, as St George is, of course, our patron saint.

Striking features in the hills round Portofino are several medieval castles restored to form summer residences for rich Genoese. The most artistic and successful of these Gothic restorations is the Castello di Paraggi, boldly situated on the edge of the promontory. But the show-house of Portofino is the Villa Carnarvon, in which the late Emperor Frederick-William, when Crown Prince, spent a part of the autumn of 1886. Her Majesty the late Queen Victoria at one time contemplated spending one of her spring holidays here, somewhat to the dismay of her entourage, who naturally preferred the gayer and more conventional Nice.

The beautiful features of the coast between Rapallo and Sestri Levante have in great measure to be taken on trust by railway travellers, as the journey is one series of tunnels.

Sestri Levante is rather strikingly situated on a tiny cape jutting out half a mile or so into a well-sheltered bay. The little town occupies the greater part of this promontory. The leading hotel is the Grand Hotel, but English visitors prefer the less pretentious Hotel Europe. The great excursion is the drive over the Bracco Pass to Spezia, one of the finest carriage-drives in Europe.

The new resort on this coast, which is beginning to be affected by English people, is Levanto, a quiet little watering-place some fourteen miles west of Spezia. The fact that an English doctor has recently established himself here may be taken as a measure of its popularity with our compatriots, while there is now a good hotel, recently built, which supplements the somewhat primitive accommodation of the Albergo Stella, so well known to artists. For some reason, this retired little place is less frequented by Germans than any other Levantine resort, and it is possible that to this may be partly due its increasing vogue with English visitors.

Levanto is the chief town of the district called the Cinque Terre—compare our Cinque Ports—from a group of five villages: Monterosso, with its interesting old church and beautiful rose-window (recently restored); Vernazza, one of the quaintest of harbours; Corniglia, perched on a high rock far above the sea; and Manarola and Rio Maggiore, two villages straggling up the sides of ravines whose picturesqueness is scarcely surpassed by the much-sung Clovelly at home. A famous white wine is produced here, known as schiacchetra.

Hitherto the only means of communication that Levanto has had with the outside world has been by rail or by sea; but a new road is being constructed which will put it in communication with the main road to the south, thereby opening up two splendid drives from Levanto to Sestri Levante on the west and to Spezia on the east, the road to the latter passing over the Bracco Pass and through lovely scenery, culminating in a magnificent prospect of the Bay of Spezia.

THE THELLUSSON WILL.

By Hugh Childers.

'He heapeth up riches, and cannot tell who shall gather them.' This text would fittingly govern a sermon prompted by the story of Peter Thellusson; or so would this other from the same lyre, 'They think that their houses shall continue for ever, and that their dwelling-places shall endure from one generation to another, and call the lands after their own names.' The modern law of England, reflecting and perpetuating the rule of the family, allows every man to do as he pleases in the disposition of his property; there is no legitim, no *pars rationabilis;* and if a millionaire is disposed capriciously to disinherit his children he may do so. What he must not do is arbitrarily and unnecessarily to postpone the enjoyment of his fortune; he must not let it accumulate at compound interest for an unconscionable time. This was not decided for the first time in the case of Mr Thellusson, but the established rule received so remarkable an illustration in consequence of the amount of the property then at stake that the case is a beacon light for the guidance of those who still toil to gratify posthumous vanity by tying up estates for as long a time as is permitted.

The feeling against acquired instead of inherited wealth, once so strong in certain circles, has proved evanescent; the old blood and the old lands seem to be played out, and to require rejuvenation by an admixture of commerce. Lord Bareacres sponging on young Osborne for a dinner at Brussels is not a pleasant object; and since the Corn Laws were repealed the landowner, as such, has gone to

the wall, and his position now is buttressed by intermarriages with trade or City finance. An hereditary estate, where corn perhaps cannot be grown remuneratively, but game will increase and multiply, is a picturesque adjunct to an ironmaster or successful weaver, and a coronet sits less ungracefully on the brows of the parvenu who has been able to annex some abbey or frowning keep. Worse things could happen; the relics of the past are tended generously out of an overflowing purse, not on account of interest or affection entertained for antiques, as such, but because their possession gives that consideration which is so assiduously and snobbishly courted. In the limited exchequer of the old county family there is no margin for sentimental expenditure; in their case half the castle is shut up, three-quarters of the stalls are empty, the hangings of the banqueting-hall (so graceful a setting for modern hospitality) get rusty or moth-eaten, the staircase has hardly been repaired since 1846.

In the Thellusson case the family were not undistinguished or of unknown origin; they had taken refuge at Geneva after the massacre of St Bartholomew. In 1762 Peter Thellusson, being then about twenty-five years of age, came to London, naturalised himself as an Englishman, and established himself as a merchant in an office in Philpot Lane. Here he pursued a successful course of business, but did not live to a great age. However, before his death at sixty, he had by trading with the West Indies succeeded in amassing what for those days was a large fortune, though it was modest in comparison with several that paid death-duties in 1906. It was put at six hundred thousand pounds in money and lands worth four thousand five hundred pounds a year. In the year before his death (1796) he made his will; and if it was a long and costly one to draft—it occupied twenty-three sheets of paper—that expense was negligible in comparison with the cost of the litigation it gave rise to. Much of the will was sensible enough, and he cannot be accused of taking the bread out of his children's mouths. He bequeathed one hundred thousand pounds to his wife and children, so no one dependent on him was left destitute. He took much trouble in the disposition of his curios. To Peter, his eldest son, he gave (after his wife's death) the family pictures; to his son G. W. Thellusson his gold seal with the family arms, the gold snuff-box which Louis the Fifteenth gave to his father (containing a portrait of the Dauphin, father of Louis the Sixteenth), the silver medal (a copy of the gold one given to his father by the city of Geneva), also the large silver coffee-pot and salver given to him by the said city with the arms of Geneva thereon; to his son Charles a gold watch made by Mudge, with three seals mounted in gold. It was when the worthy trader came to deal with the bulk of his huge estate—some six hundred thousand or eight hundred thousand pounds, earned, as he paraded the fact in the will, by 'industry and honesty'—that he showed his 'vanity, illiberality, and folly,' for he decreed that none of his living descendants should ever be the richer for his money; it was to accumulate till they were all dead, and was then to be enjoyed by lineal representatives whose description was so obscurely worded that sixty years later it was a difficult and expensive matter to ascertain who was intended. 'No one,' wrote one of the newspapers years later, 'of the children or grandchildren who had ever looked Peter in the face, or trembled in his presence, or squalled at the sound of his harsh, hard voice, should ever be the richer for Peter's wealth. . . . The will was opened, and created sensations which vibrated through the land in widening circles. Our law-books picture the blank disappointment of the then living relatives, the gentle cachinnations of a past generation of lawyers, and the gaping wonder of the general public. There were three sons and six grandsons of this malignant old merchant then alive, all destined to live the life of Tantalus, to see this great pagoda-tree growing up before them, yet none to pluck one unit of its fruit. Persons of an arithmetical and statistical turn of mind occupied themselves with the matter, and with the aid of life insurance tables and Cocker they estimated that this fund, accumulating at compound interest, could not amount to less than nineteen millions at the moment of distribution, and would very probably reach the tremendous figure of thirty-two millions. But "nothing is so false as facts, except figures." The calculators had forgotten to take account of that unknown quantity which must in practical matters be represented not by the letter x but by the word "litigation."'

A suit was instituted in the Court of Chancery just before the close of the eighteenth century, and the validity of such a capricious arrangement of property vigorously attacked; an immense amount of ingenuity was expended upon it *pro* and *con.*; but the courts held that the will was not an unlawful one, nor so much opposed to public policy as to be set aside. But it has since been said that conditions far less objectionable have been overridden as opposed to general policy, as was especially the case when a clause directing the forfeiture of an estate if its owner within a certain period did not acquire a certain title was unlawful, as giving him an incentive to obtain it by improper methods. Old Thellusson further showed his vanity in forcing his shadowy and far-distant beneficiaries to assume his surname; for in default of doing so the estate was not to go to them but to pay off the National Debt; and he concluded with an abject appeal to Parliament not to interfere with the disposition he had made of the fortune amassed by his industry. Parliament did not do so retrospectively, but it made similar provisions impossible for the future; and the Lord Chancellor, on introducing the measure for the purpose—now known as the Thellusson Act—said he had been told in confidence by a conveyancer that the latter had received

instructions to draw a will directing accumulation to take place during the lives of all the peerage of England.

The newspaper of 1859 from which I have already quoted proceeded to describe the lawsuit, and continued: 'That suit is now sixty years old, and although children and grandchildren are dead the suit is as hale and lively as it was in their earliest youth. That suit was the true heir to Peter Thellusson, and it is still spending his money like a frolicsome young cornet. Peter Thellusson's clever scheme has turned out a foolish failure. No single Thellusson will stalk over the land overshadowing our dukes and crushing our barons by the magnitude of his territorial possessions. No thirty-two millions of money are expanded into broad acres, where men may travel and say, "Behold the conquests of the great Peter Thellusson."'

How like all this is to Dickens! Indeed, one may compare with it this passage in *Bleak House:* 'This scarecrow of a suit has, in course of time, become so complicated that no man alive knows what it means. . . . Innumerable children have been born into the cause, innumerable young people have married into it, innumerable old people have died out of it. Scores of persons have deliriously found themselves made parties in "Jarndyce *v.* Jarndyce" without knowing how or why; whole families have inherited legendary hatreds with the suit. The little plaintiff or defendant who was promised a new rocking-horse when "Jarndyce *v.* Jarndyce" would be settled has grown up, possessed himself of a real horse, and trotted away into the other world. Fair wards of court have faded into mothers and grandmothers; a long procession of Chancellors has come and gone out; the legion of bills in the suit has been transformed into mere bills of mortality. There are not three Jarndyces left upon earth, perhaps, since old Tom Jarndyce in despair blew his brains out at a coffee-house in Chancery Lane; but "Jarndyce *v.* Jarndyce" still drags its weary length before the court, perennially hopeless.'

If Dickens did not immediately intend the Thellusson case to be the original of Jarndyce *v.* Jarndyce, he makes an obvious reference to it in the preface, written in 1853: 'At the present moment [August 1853] there is a suit before the court which was commenced nearly twenty years ago, in which from thirty to forty counsel have been known to appear at one time, in which costs have been incurred to the amount of seventy thousand pounds, which is a *friendly suit*, and which is (I am assured) no nearer to its termination now than when it was begun. There is another well-known suit in Chancery, not yet decided, which was commenced before the close of the last century, and in which more than double the amount of seventy thousand pounds has been swallowed up in costs. If I wanted other authorities for Jarndyce *v.* Jarndyce I could rain them on these pages, to the shame of —a parsimonious public.'

The parsimony Dickens had in his mind was the reluctance of the general public of that day to recognise the necessity for creating any additional Chancery Judges, believing that the remedy for the admitted delays lay rather in the direction of modernising the procedure.

I need not dwell longer upon the actual Thellusson story. The final decision in 1859, when the period for enjoyment according to the tenor of the will had arrived, was required for the true interpretation of the ambiguous phrase 'eldest lineal male descendant;' though the real heirs of Thellusson, the legal profession, had only left a small amount for any other beneficiaries. The House of Lords received with all honours the time-honoured lawsuit, and decided that the above phrase was to be interpreted according to the rules which govern the descent of lands or titles, and did not indicate the 'lineal male descendant' who had been longest in the world; and the present Lord Rendlesham and a cousin were held to be the eldest lineal male descendants of Peter and Charles Thellusson, the only sons of the testator who had left issue. The last-named Peter has been made Lord Rendlesham; he was the first Irish Peer created since the Act of Union, which allows one such creation only upon the extinction of a certain number of older Irish peerages.

The death-duties of 1894 and 1907 will not lead to the multiplication of 'Thellusson testators,' as millionaires will, if anything, denude themselves in favour of their sons rather than their sons in favour of their great-grandsons; I say 'if anything' advisedly, for the normal tendency of a rational human being is neither to give away his capital in his life nor to refrain from handing it to his children at his death. The creation of life estates by will argues a suspicion of a testator's natural and nearest heirs. The case of the marriage settlement is quite different, and is generally the result of a bargain which in some cases has nothing mean or avaricious about it. But the Thellusson case was the *reductio ad absurdum* of a bequest for accumulation, and remains a monument of testamentary vanity.

LOVE AND DEATH.

Set not a bound to Love. It is as wide
As God is; its immeasurable deep
Laughs at the plummet; its full waters sweep
Throughout infinitude, taking their tide
From Him in whom eternities abide.
Yet plunge, and fear not. The strong waves shall leap
Joyous to bear thee; no soft child asleep
Can breathe more safe against its mother's side.

Nor needst thou fear when Love's wide waters take
Their other name. Oh! thou that passest through,
Call them no longer Death, since, for thy sake,
The floods stand back that thou mayst walk dry-shod,
Freed from thy House of Bondage, to that new,
That larger life where all is Love—is God.

THE NEW RIVIERA.

PART II.

SPEZIA, by virtue of its situation on the shores of the most beautiful bay in north Italy, might almost be included among Humboldt's three most beautiful towns in Europe. For some years it hung fire as a winter resort for foreigners; but since a new water-supply has been laid down, and the hideous naval coalyards and magazines have been transferred to the eastern harbour and replaced by a fine public garden, the town is growing in favour. A resident English chaplain and medical man afford a measure of its increasing popularity with English visitors.

The mention of Spezia calls up literary memories of Byron, the Shelleys, and Leigh Hunt. It is not, however, so generally known that it is closely associated with Charles Lever and Mary Somerville, who both made Spezia their summer headquarters for many years. Lever first came to Spezia in 1852, and used to live here intermittently till 1857, when Lord Derby appointed him to the post of vice-consul. The office was virtually a sinecure, as, though Spezia was even then designed by the Government as the site of the chief naval arsenal, the building of the docks and quays, which were to convert this smiling bay into the Portsmouth of Italy, was not then begun, and it was a small seaport of barely six thousand inhabitants. In fact, the cynical remark that Lord Derby made when offering in 1867 the consulship of Trieste to the novelist, 'Here is six hundred pounds a year for doing nothing, and you are just the man to do it,' would have applied with greater force to the Spezia vice-consulate. At Spezia Lever wrote some of his best work. *The Daltons*, *The Dodd Family*, *Davenport Dunn* (dealing cynically with the travelling English on the Continent), are thoroughly cosmopolitan in their scope, and show a remarkable advance, as well as a startling transition from the rollicking, slap-dash novels, *Charles O'Malley*, *Harry Lorrequer*, &c., by which Lever is best known.

In his sketches of travelling English on the Continent, Lever, like so many Englishmen compelled for various reasons to live abroad, is very intolerant of his compatriots travelling for pleasure, and he never loses an opportunity of showing up their ignorance of foreign manners and customs and ridiculing their hide-bound insularity. It was this supercilious attitude which brought him into collision with the great excursionist agencies whose enterprise as pioneers of popular travel was at that time little understood or appreciated. In one of his 'Cornelius O'Dowd' papers in *Blackwood's Magazine*, Lever went out of his way to ridicule and discredit his countrymen comprising Messrs Cook's parties. Taking 'Continental Excursionists' as a peg for his satirical strictures, he declared that he had seen 'the cities of Italy deluged with droves of these creatures, pouring along a street with their director now in front, now at the rear, circling round them like a sheep-dog; and really the process is as like herding as may be. I have already met three flocks, and anything so uncouth I never saw before: the men mostly elderly, dreary, sad-looking; the women somewhat younger, travel-tossed and crumpled, but intensely lively, wide awake, and facetious.'

These cheap witticisms at the expense of English excursionists seem nowadays forced and extravagant, but they had considerable effect then. Had he stopped there it would not have mattered much. But it was beyond a joke when he proceeded to tell his Italian friends that these tourists were convicts whom the Australian colonists had refused to receive, and that they were sent by the English Government by arrangement with Mr Cook, who was instructed to drop a few in each Italian city! Whether the Italians as a race are lacking in a sense of humour is a moot point, but at all events these absurd fictions were often taken seriously. Mr Thomas Cook, however, was equal to the occasion, and made a spirited protest to the Foreign Office, maintaining with some show of reason that Lever would not be disposed in his official capacity as consul to pay heed to any complaints by English tourists abroad; and asked the then Foreign

[*All Rights Reserved.*]

Secretary, Lord Clarendon, if it was 'fitting on the part of Her Majesty's Consul at Spezia to take up an attitude of antagonism to his countrymen in foreign parts.' However, as these attacks had been made under the pseudonym of 'Cornelius O'Dowd,' it was not, of course, possible to connect Lever with them officially.

From tourists to tours is a natural transition. Spezia makes a capital centre for excursions, and indirectly the aggressive militarism of Italy has actually benefited tourists, as the hills around have been gridironed with a number of military roads with very easy gradients, providing an endless variety of walks and drives. But in these rambles it is advisable to keep at a respectful distance from any fort or military post. The official warning against approaching within three hundred yards of any fortification is by no means a *brutum fulmen*, as many tourists have found to their cost.

Lerici (with its memories of Shelley), Porto Venere (dear to all lovers of Byron), and the marble quarries of Carrara are among the many excursions that can be comfortably managed in one day. It must, however, be admitted, with regard to Porto Venere and the Byron tradition, that the popular legend of the country-side, which makes the Byron Grotto the spot where the poet composed *The Corsair*, has no historical basis. But the inscription over the cave is not altogether to blame for this tradition, as those responsible for it were careful to state that the grotto 'inspired Lord Byron to write *The Corsair*,' which at all events is less incredible.

To go a little farther afield, there is much to interest the enterprising tourist in the hinterland of the Bay of Spezia—an undiscovered country as far as modern travellers are concerned. The valleys are strewn with ruins of ancient Etruscan cities which would probably repay systematic excavation; and the whole of this beautiful coast is reminiscent of literary and historical lore, to say nothing of classical and mythological tradition. Ligurian historians assert that Virgil borrowed the topography of the Gulf of Spezia in his description of the bay in which Æneas took refuge after the storm. This claim, however, modern commentators are given to ridiculing, as it is evident that Virgil, who in his way was as great a plagiarist as Shakespeare, 'lifted' the description with but little alteration from the well-known scene in the *Odyssey*.

But no visit to Spezia could be considered complete which did not include a pilgrimage to Shelley's villa, the historic Casa Magni, a favourite shrine of tourist culture. The drive is not, however, beautiful, except for the sea-views which the ugly eastern suburbs of Spezia cannot spoil; and one consolation is that there is no risk of an anticlimax when the painfully commonplace surroundings of the villa are reached. In the poet's time Casa Magni, once a Jesuit convent, was situated in one of the most romantic and secluded nooks of the whole coast; now the dirty, overgrown fishing-villages of San Terenzo and Lerici have encroached on the beautiful landscape, and the immediate surroundings of Casa Magni are the despair of the painter.

Besides the more modern memories of Shelley, this region is associated with a greater name—Dante. Here the poet, driven from Florence by his enemies, wandered on his way to France, journeying, according to Mr Gladstone, by way of the Corniche (then a mere mule-path), the Esterelles, and Draguignan to Paris. Some of the scenery in the *Purgatorio* is borrowed from the Riviera, and the cantos are full of local colour which may be traced to the landscape of these shores. Travellers of to-day following in the traces of the poet will recognise in the 'fair river' the Entella that flows into the sea near Sestri Levante, and can understand the reference to 'the rough and desert ways between Lerici and Turbia,' for the modern Corniche Road follows for the most part of the route the wild mule-path along which Dante wended his lonely and melancholy way. The more attractive aspects of the scenery are occasionally noted in the *Purgatorio;* and artists, at all events, will recognise the *tremola della marina* just before dawn.

In this cursory bird's-eye view of the winter stations of the Eastern Riviera I have confined myself to those which are in some measure developed and adapted for winter colonisation by foreigners. Those, however, with a genius for roughing it can still find beautifully situated little towns and fishing-villages where local characteristics have not been swamped by attempts at modern improvements, and where the artist and lover of nature may still find the picturesque, historic, and old-world atmosphere of Provence and Liguria of some fifty years ago.

Still, though we may regret this æsthetic deterioration of the Riviera, *il faut vivre*, and it is obvious that the undeniably picturesque and unspoilt towns and villages, however satisfying to the artistic soul, are quite unsuitable as winter quarters for English people. A painter may admire the irregular, winding, narrow alleys, and the picturesque grouping of the houses, the arcades and *portici*, the *loggie* and shrines, the churches and ancient watch-towers, &c.; but one's olfactory sense cannot long ignore the fact that sanitation is as non-existent as in Jerusalem or the native quarters of Cairo. In short, only those who can put up with native fare and ways of living, and understand Italian life and character, could tolerate an absolutely untried and unexploited wintering-place on this coast. To say nothing of the lack of tolerable hotel accommodation and deficient communications, there are practically no shops. Butcher's meat is obtainable only at rare intervals, while butter and milk are scarce.

In fact, this region, especially that part known as the French Riviera, can barely support its own inhabitants. Almost the only natural products yielded in large quantities are olive-oil, wine, Indian corn, lemons, and oranges. To feed its alien population of winter visitors it imports beef from Turin and Piedmont; butter, cheese, and eggs

from Milan; poultry from Toulouse; and mutton from the Rhone valley. Milk is easily procurable in the large towns only, and even there it is produced under unnatural conditions, the cows being kept in stables during the winter, as there is no pasture.

Then, even in this land of sunshine, it must be remembered that the sun sets, and the evenings are cold, and Sahara becomes a Siberia. At the inns in the smaller primitive places the only substitute for a fireplace is a curious apparatus resembling a miniature pillar-box, which is filled with wood-ashes. Still, we are not reduced, as in Piedmont, to carry our fire-boxes (*scaldini*) about with us.

These are a few of the drawbacks of the unexploited 'beauty-spots' appealing to the artistic traveller which must be considered by those contemplating a winter holiday off the beaten track. But a stay in one of these unsophisticated coast towns or fishing-villages affords excellent opportunity for getting in touch with the inhabitants and learning their habits and mode of life.

A visitor who is *simpatico* and companionable will find no difficulty in getting to know the peasantry and fisherfolk. The inhabitants of this coast resemble in many respects the Piedmontese. Though frugal, hard-working, honest, devout, hospitable, and pleasant in their dealings with strangers, they are not the unsophisticated folk as depicted in the impressionist sketches of certain lady-writers. It is sometimes complained that they are apt to be grasping and overreaching with *forestieri*. But very often this is but a kind of 'try on,' and as soon as they appreciate the fact that the foreigner will not be imposed upon they will give up attempting to get the better of him. Generalisations are proverbially dangerous; but, making due allowance for this, the description of an inhabitant of the Levantine Riviera as one-half Irishman (with his amiability, adaptability, and desire to please) and one-half Boer (with his proverbial cupidity and slimness) might pass. At all events, the Ligurian peasantry and fisherfolk are far pleasanter to deal with than the inhabitants of the Riviera farther west. Indeed, the contrast is very striking between the sturdy and self-respecting natives of the Riviera di Levante and the hybrid, parasitic inhabitants of the French Riviera, who for the most part live on the hordes of rich foreigners who have converted their country into the winter playground of Europe.

A PAWN IN THE GAME.

CHAPTER XV.—A DISTRACTED CITY.

PARIS at that moment was a stage on which a thousand passions — some noble, but many base; some heroic, but not a few devilish—were set all in wildest activity. Tragedy and comedy jostled each other in every street, and Jean saw with wondering eyes a thousand strange sights.

An official with a brilliant red scarf round his waist was strutting majestically down the street one morning, with a little squad of newly enlisted soldiers behind him. A carriage splashed by too near, and threw some mud on his coat. He stopped, drew himself up majestically, and signalled the coachman with a gesture to stop.

'France,' he announced in pompous tones, 'needs horses to draw her cannon.'

At his bidding the traces were unloosed and the horses led off, leaving the carriage stranded, with a stout lady leaning from the window screaming vain appeals, and the astonished coachman still on the box. But the splash of mud was avenged!

A little farther on a crowd was pulling down the iron railing in front of the Luxembourg, and carrying the rails to some improvised forges near, where they were being beaten with furious haste into pikes, all with loud clamour of voices and much useless running to and fro on the part of everybody.

On the slopes of Montmartre, Jean found a huge crowd plying spade and pick with frantic industry, a number of members of the National Assembly, with tri-coloured scarfs round their waists, amongst the number. Paris was to be girdled with trenches against the approaching Prussians. But there was no method in the industry of the crowd, and no continuity. The next day, when Jean visited the spot, the crowd, including the members of the Assembly with their scarfs, had vanished like a flock of alarmed birds, and the abandoned shovels lay in the half-dug trenches.

Paris was a city of impulses, a reed shaken by many winds, and winds which blew sometimes in wildly opposite directions. And meanwhile the hungry queues, as the autumn evenings fell, gathered at the doors of the bakers' shops to wait till morning for the daily distribution of bread.

The great room in the Hôtel de Ville, where a committee of the Commune was in permanent session, was the one centre of governing energy, and here the stage for the human drama transacting itself was always set, and always crowded with gesticulating figures. Jean stood in the hall one afternoon and watched with amazed eyes the whole scene.

Round a table in the centre sat ten or eleven men. Some had sabres at their side; all had red caps on their heads. A constant restlessness shook them. Two or three would speak at once, and they addressed the spectators as often as they addressed each other. One or another was continually leaving the table to confer with somebody in the crowd, and then running back to the table. A fever seemed to burn in their very blood and to forbid them to be quiet.

But the figure in the centre was darkly formidable. He was little more than a dwarf in height, but with broad shoulders, short neck, and huge head. His body was thin, and as he moved from the table it could be seen that his legs were twisted. His face was strong-featured, with flattened nose and twitching lips. The eyes, beneath the black, slanting eyebrows, had a curious gleam of yellow; the inflamed eyelids had a perpetually restless and snapping movement. The skin was blotched as though with disease, the hair uncombed, the chin bristly. Jean somehow felt a chill run through his blood as he watched this figure.

'Who is he?' he asked of one standing by.

'It is Jean Paul Marat,' was the answer in tones of surprise, 'the friend of the people, the keeper of the people's conscience,' he added, using a phrase which had just become popular.

Deputations, composed of the oddest materials and on the oddest errands, thrust themselves continually on the attention of the committee. An official in a soiled red cap, a blouse, and ragged striped trousers had it as his business to introduce each deputation in turn, but in most cases the deputation insisted on introducing itself, and did it with many independent voices. Jean watched the whole spectacle as if it were a procession of comedies; but always there was the sense that behind the comedy, so unconscious of its own ridiculous aspect, were the dark forces of a hurrying tragedy.

One deputation came in to the sound of music. Its members wore the robes of priests, and carried crosses and a banner. But the little band at the head of the procession was playing one of the wild tunes of the street, and in front of the table, behind which sat the committee, the priests threw down stole and chasuble and dalmatic, while others put down their certificates of ordination on the table itself. They came to renounce their priesthood. The crowd broke into a frenzy of approving cries, and the priests and the members of the committee embraced each other across the table.

Another deputation was of a more practical character. It consisted of a gang of workmen equipped with spades, saucepans, and pickaxes. The craze of the moment was to extract saltpetre for gunpowder from the floors of cellars and stables. This particular group was on its way to this task, and dropped into the Hôtel de Ville, on the road, to proclaim their patriotic intentions with *vivats* and embraces.

Another group, which Jean somehow found pathetic, was a little rustic company from a village called Rex. They carried a rusty iron cross, and explained that it represented the overthrown shrine of the patron saint of the village, who had been deposed and replaced by a statue of Brutus. The name of the village, the deputation complained indignantly, was aristocratic, and they asked that it might be changed to 'Brutus'—a request that was granted with enthusiasm.

A deputation of women appeared, bringing various gifts of a feminine sort for the service of the commonwealth. Some of them put ornaments on the table, others scissors and thimbles. One matron placed on the table a little girl, aged seven or eight, who solemnly produced her savings and laid them on the altar of her country in the shape of the rough hand of Marat. The mother explained that her daughter could both sing and recite, and the committee was offered the choice of hearing the Rights of Man recited or a popular song on the martyrs of liberty sung. For once, however, the members of the committee were impatient, and the red-sashed little girl had to be consoled by a paternal kiss from the chairman.

Jean watched the two faces as they touched—the bristly chin of Marat, the tender lips of the child. What strange opposites, symbolic of still wilder extremes, had met in the world-tragedy of the Revolution!

The last deputation that arrived while Jean watched was perhaps on the strangest errand of all. A citizen, who groaned under the name of St Chamant, appeared with his wife and children, asking that the whole family might be *unbaptised*, so that the last stain of superstition should be purged from them, and that he and his wife might be temporarily divorced and immediately remarried by civic rite under new names.

This astonishing ceremony was duly performed. In the name of the nation each member of the little group was declared to be purged of baptism. The proud father was named Aristides, the wife Atride, the eldest son Regulus; the daughter—a little girl of four—was labelled with the alarming title of Révolutionnaire.

The eruptions of oratory which attended all these performances were numerous and fiery, but when Marat spoke the effect was startling. His voice was thin, but it had a curious ringing quality. Some defect of the twisted mouth made his pronunciation faulty, but his voice had the edge and hardness of a sword-blade, and his sentences hissed with anger as he talked of poor Louis XVI.—'this brigand, perjurer, conspirator, without honour and without soul.'

Night was darkening over the great building, the long passages were black with shadows, the gloomy hall was lit with a few candles, but still the tragi-comedy of the Revolution was in progress, the passions and follies of the crowd were eddying round the table where the committee sat, as Jean forced his way through the crowd into the street and drew a deep breath of the keen September air.

Above the huddled roofs and the foul lanes of the city, black with coming night, rose the pure evening sky, a concave of darkest purple, pricked with a few pin-points of white, the white of the kindling stars. In the west the last glow of a splendid sunset was dying in hues of amethyst and primrose. How could the heavens be so clean and calm above while the earth beneath was so stormy and dark?

(To be continued.)

GOLFING LITERATURE.

By F. KINLOCH.

IT is a rather curious and significant fact that in these latter days there is more written about golf than about any other game—the term game is used advisedly in contradistinction to sport. Yet this literature of golf is almost in its infancy; for the first really important book on the subject, Mr Robert Clark's historic work, *Golf: a Royal and Ancient Game*, was published as late as 1875. Nowadays books dealing with various branches of this great game appear with clock-like regularity, and there is no end to the ordinary golfing article; though, indeed, we see a marked family likeness to each other in many of them.

Why is it that this new field has only of late been discovered by the littérateur and the journalist, and in what lie its capacities? Golf is an old game—how old no one may authoritatively assert. In the opening chapter of one of the books which it is our pleasant duty to notice, Mr Everard's *History of the Royal and Ancient Golf Club of St Andrews*, Mr James Cunningham, who contributes this chapter by special request, seems to prove fairly conclusively that we may look to Holland for its origin; and yet the editor of a well-known golfing journal gives this theory but scant approval. Here, therefore, we have all the bones of a fine controversy. Perhaps it is the capacity which golf lends itself to for intricate controversial arguments, such as the abolition of the stimy, the merits and demerits of links or clubs or balls, which appeals to the scribbler. Perhaps it is because golf is more than a mere pastime; it is a game which pre-eminently brings out character. And be it said that it does not always bring out the best traits; often, indeed, does the veneer of civilisation disappear, and the worst traits of a man's inner soul are brought to light. Men who have gone through life with a well-earned reputation for strict integrity have been known to yield to the temptation—if no one is looking—of removing an offending obstacle in a hazard; men whose language in ordinary life is always refined and temperate have been heard hurling the most horrible curses at the unoffending ball; men who have faced death cheerfully will tremble over a simple putt. But, on the other hand, it brings out sterling qualities, such as pluck, endurance, self-restraint, moderation in all things, good-fellowship. Herein lie some of the many charms of the game; and writers thereof have made, and continue to make, the most of a game which so bares the human soul to view.

It is the custom to say that the undoubted improvement in golf-playing is due principally to the introduction of the rubber-cored ball. The writer is firmly of opinion that this improvement began much earlier, being, indeed, contemporaneous with the influx of golf over the border into England. Men, especially those to whom the game was new, thought deeply about it, and did not accept as true the theory that because our ancestors played with a certain kind of club, it was, therefore, the right one. The dim idea that we were playing with the wrong kind of club was crystallised by the late Mr Henry Lamb's invention—or call it what you will—of the 'bulger.' Now *quâ* 'bulge' there was nothing in the club. Some clever verses which appeared in the now defunct *Scots Observer* aptly define its merits:

From him that heeleth from the heel,
Or toeth from the toe,
The bulger doth his vice conceal,
His drive straight on doth go.

To him who from the toe doth heel,
Or from the heel doth toe,
The bulger doth his faults reveal,
And bringeth grief and woe.

And the poor slicer's awful fate,
Who doth a-bulging go,
Is sad indeed to contemplate—
The bulger is his foe.

But whoso plays the proper game,
His ball who striketh true,
He findeth all clubs much the same—
A goodly thing to do.

Bulgers and mashies, presidents,
Are for weak players made,
As spectacles and crutches be
For eyes and limbs decayed.

This last verse has a special interest irrespective of the truth which underlies it, in the reference to the 'president.' This was a niblick with a hole in the blade, which was supposed to have special virtues in a bad lie. It was dedicated *nomine* to the Right Hon. John Inglis, Lord President of the Senate and Court of Justice in Scotland, perhaps the most learned judge that has ever occupied that exalted position. He was one of the keenest golfers imaginable, and very well known in old days at St Andrews and Musselburgh. Pity is it that the club named after him should have had so short a life, for one never sees them now.

The shape of the bulger club-head, which was convex, necessitated a much shorter, fatter head than the old-fashioned one. Then it was evolved that supple shafts did not suit the new shape. Shafts became more 'steely,' and men began to discover that they could hit much harder. Thus insensibly the methods and style of play changed; the game became more forceful because the clubs could stand a greater strain. It is from this time (about seventeen years ago) that extraordinary clubs and balls began to be patented, and the date coincides more or

less with the coming of golfing literature. All this, however, is a digression from the work on hand, which is to notice briefly four books recently published, which form a notable addition to a golfing library. These are *The History of the Royal and Ancient Golf Club of St Andrews*, by H. S. C. Everard (Wm. Blackwood & Son); *The Life of Tom Morris*, by W. Tulloch, D.D. (T. Werner Lawrie, London); *The History of the Glasgow Golf Club*, by James Colville (John Smith & Son, Glasgow); and *The Spirit of the Links*, by Henry Leach (Methuen and Co., London).

The first two deal almost exclusively with St Andrews, indeed act in some degree as complements to each other, Dr Tulloch's book filling in gaps in the golfing life of the early and mid Victorian eras which Mr Everard, who has relied solely on the minutes of the club, has left more or less untouched. Mr Everard's book is of more than merely local interest, especially appearing as it does contemporaneously with one of those periodic movements when the eyes of golfers not only in England but in the United States are directed towards the Royal and Ancient Golf Club in her capacity of golf-law making. Critical eyes some of them are; for it is said, and with a modicum of truth, that the rules of golf as they stand at present, are in places somewhat cumbersome and involved, while at the same time they do not cover points which are continually cropping up. It is well in this connection to note that the club has recently extended the right hand of fellowship to golfers on the other side of the water by inviting a representative and former president of the United States Golfing Association, who is also a member of the 'R. and A.,' to a seat on the Rules of Golf Committee—that committee which decides knotty points for golfers all the world over, and which at this very time is engaged in the simplification of the code. The invitation has been accepted. The 'Royal and Ancient,' as one may gather from its history, has always been very jealous for the game of golf and for the grand links of St Andrews, and we may safely trust her present representatives to maintain the traditions of their forebears.

Mr Everard's book is no mere dry-as-dust chronicle of the club's history; it is as well the story of golf as played at St Andrews from time immemorial. He tells how the right to play at golf is reserved to the community in a deed dated 1552, wherein the city of St Andrews gives license to one John, Archbishop of St Andrews, 'to plant and plenish cuningis (rabbits) at the north end of the links.' From this extract he draws the deduction that golf had evidently been played for years before. Then through the centuries he traces the existence of the game by extracts from old diaries (some of them most quaint and amusing reading) and from kirk-session records, and by these we may gather that the question of Sunday golf was vexing the souls of the 'unco guid' as early as the seventeenth century. Finally we come to the origin of the 'Royal and Ancient' in 1754: 'On the 14th May 1754 twenty-two noblemen and gentlemen, being admirers of the ancient and healthful exercise of the Golf, met together and drafted certain Articles and Laws in playing the same.' In these words is the genesis of the premier club recorded, and the names of the subscribers have a familiar sound down to the present day. Having settled their laws, they proceeded to subscribe for a silver club, which was to be open to all and sundry in Great Britain and Ireland. This was, in fact, the first open championship. But the method of deciding it was for the first five years so complicated that it passes even Mr Everard's ingenuity to understand how the system was carried into operation. At any rate it was found to be unsatisfactory, for the present method of scoring by strokes was instituted five years later, in 1759. It should be said that at first the winning of the silver club carried with it the captaincy of the club, and it may be that some undesirable individual gained that honour, for in 1773 the competition was limited to members of the St Andrews Golfing Society and those of the Leith Golfing Society (the present Honourable Company of Edinburgh Golfers). This is a delightful proof of the early intimate relations which existed and still exist between the two great Scottish clubs.

In those early days there were twenty-two holes at St Andrews—eleven holes out and eleven in, the same holes of course being played both ways. The last hole was called the Hole o' Hill, and the name suggests that the last green was situated farther up the hill than the present one—nearer, indeed, the site of the Martyrs' Monument. If so, there would be plenty of space for a hole midway between the Swilcan Burn and the Home Hole; but this is mere conjecture. It should be said that an eighteen hole course was made in 1764.

There were giants in the golfing world in those days, even as in ours, and chief among them was Mr James Durham of Largo. It was in 1767 that he won the silver club with a score of ninety-four. 'A truly remarkable score,' says Mr Everard, 'when we consider that it was made in a sort of palæolithic age of golf, when the clubs, to judge by the specimens extant, bore about the same relation to those of to-day as flint and steel to a wax match.' Moreover, the links were practically an untrodden waste, so that the more we think of it the more does this performance appeal to us as being almost superhuman. The best comment that can be made on it is the fact that it remained a record for eighty-eight years.

Mr James Durham has other claims to fame. Every one knows that Edinburgh is nicknamed 'Auld Reekie,' but few know the origin of the term. Quoting from Robert Chambers's *Traditions of Edinburgh*, Mr Everard tells that 'Mr James Durham was in the habit of regulating evening worship by the appearance of the smoke in Edinburgh—from Largo Law he had a fine view up the Firth of Forth. When it was increasing in

density in consequence of the good folk preparing supper, he would say, "It is time noo, bairns, to tak' the buiks, and gang to oor beds, for yonder's Auld Reekie putting on her night-cap."'

As we have said, this score of ninety-four remained easily a record till 1853, when Captain J. C. Stewart went round in ninety. This score was beaten two years later by Mr George Glennie's eighty-eight, by which he won the autumn medal of the club. To go round St Andrews under ninety was then almost, if not quite, unknown, and Mr Glennie's round was talked of for years with bated breath. It survived as a record till 1879, when Mr W. J. Mure won the spring medal with eighty-six; but so far as the chief award of merit (the King William the Fourth Medal) was concerned was not beaten till 1884, when Mr Horace Hutchinson did an eighty-seven. Nowadays records do not last so long.

We now reach that stage in which the book has, as we said before, its complement in *The Life of Tom Morris;* so we take our leave of an interesting and well-written contribution to golfing literature. It should, however, be said that the volume is beautifully got up and printed, and abounds in old photographs and illustrations, the most interesting of which perhaps is one of the Home Hole in the days before there were any houses abutting the links at all, except the corner one at the far east end, the site of the present Golf Hotel. Unless we are mistaken, that used to be Allan Robertson's shop.

We may frankly confess that the first impression of Dr Tulloch's life of 'Old Tom' was rather that of disappointment. Not that the book is uninteresting or badly written—far from it. It is a most valuable record of old matches both professional and amateur; there is plenty of gossip about the golfing society in Tom's early days—a most interesting period; there is a great deal about Young Tom and his triumphs; but of Old Tom as a man, of how he rose to be universally regarded all the world over as the head of his profession, as the Grand Old Man of golf, and of the qualities which enabled him so to rise, we learn but little. But on second thoughts we began to realise what a difficult task the biographer had on hand. Undoubtedly in his day Tom Morris the Elder was a great golfer; he and Allan Robertson were individually better than any others of their time. But Old Tom as a great golfer was completely overshadowed by his son Young Tom, who was not only a great golfer but a golfing genius, of whose prowess men talk even now. It will not, therefore, be by his pre-eminence on the links or the deeds that he did there that his memory shall live green in time to come. Rather will it so live because by his character as a staunch, true-hearted, lovable, upright, God-fearing man, resisting the many temptations which in his early life beset his profession, one of nature's finest gentlemen, he won, and has retained, the affection and respect of all who have come into contact with him. But the kind of life that a man such as Old Tom has led has few milestones to mark the road. The years slip quietly by, and gradually, insensibly, Tom Morris gets better and better known, more and more respected. Golfers rise, flit across the stage of golf; for a time their deeds are in all men's mouths; they disappear and are forgotten. It will not be so with Old Tom, even as it will not be so with Freddie Tait.

We have endeavoured by this train of thought to bring out the fact that the material the biographer had to work on was scant, and had therefore to be eked out by what he calls 'Glimpses of St Andrews.' It is these glimpses which enable us to fill in some of the gaps left by Mr Everard, and reconstruct the dawning of the present day of golf. Probably in the early days of the nineteenth century the pulse of golf beat but feebly. Did not the Honourable Company of Edinburgh Golfers fall into a catalepsy for three or four years in the thirties? It was the darkness before the dawn, for about this time a small band of enthusiastic golfers found themselves at St Andrews, bound together by the mysterious attraction of the game, and among them was a gentleman with poetic tendencies, Carnegie by name. He put into verse for the edification of golfers past and present the doings, matches, and peculiarities of that coterie, keen sportsmen and golfers all of them, who pulled the ancient game out of the mire. From these poetic effusions Dr Tulloch has quoted freely and with judgment.

Tom Morris was born in 1821, and found himself feather-ball making for Allan Robertson at a time when the glory of these worthies was at its height. Pity it is that, as he says, he 'doesna mind muckle aboot them.' So the early part of the book deals almost entirely with general golf at St Andrews, especially with Allan Robertson and his feats on the links. Tom left to take charge of Prestwick Links in 1851, by which time he had already played that historic foursome in partnership with Allan Robertson against the Dunns of Musselburgh. In the final stage of that match (which was for four hundred pounds) at North Berwick the Dunns were four up and eight to play, and odds of twenty to one were laid on them (men used to bet high in those days). By one of those extraordinary changes of fortune which so often occur at golf, Tom and Allan won four out of the next six holes, so the match was all square, with two to play. The next hole was one of the most extraordinary ever recorded in the annals of big matches. Nerves were in evidence, for the St Andrews men had played three more and were bunkered. But the Dunns found their ball in a terrible place under a large stone. It was solemnly proposed to send for a pickaxe to remove the obstacle; but the referee firmly put his foot down on that proposal. Then apparently the brothers lost their heads. Four times did they hash at the ball before they thought of jobbing it out with the point of the club. By this time it was too late; the hole was lost, and with it the match and the

money. It is said that Tom Morris played the best of the lot, and that the credit of winning was mostly due to him.

While he was at Prestwick he used frequently to visit his native home to play matches, and he challenged Allan Robertson to play him for one hundred pounds, but the challenge was not taken up. Little is mentioned of his life at Prestwick or of the matches he played in the West, except that he flourished as a club and ball maker.

It was in 1863 that he returned to St Andrews to take charge of the green, which post he retained till advancing years made it impossible for him to do his duties, which were becoming more exacting every year. From this time onwards Dr Tulloch's book is a mere chronicle of the matches and tournaments in which the subject of his biography happened to play. In the sixties, before the rise of Young Tom, Old Tom had his run of success. Four times in that decade did he win the championship belt—that belt which was eventually won outright by his son; but with the latter's advent the father's play seemed to deteriorate, until the Indian summer of his golf arrived, and at the age of seventy he suddenly had a new lease of golfing life, and for the next few seasons played better than he had done for many a year. One would naturally have imagined that father and son would have made an invincible combination, but they did not. The elder man contracted a bad habit of missing short putts. Dr Tulloch tells a story that a letter addressed 'To the Misser of Short Putts, Prestwick,' reached its destination; while Young Tom, in genial sarcasm, used to chaff his father, 'Gin the hole would come to ye, ye'd be a fine putter, faither.' Of late years he got over that failing. 'I never miss thae noo,' he said, after an old crony had expressed surprise at seeing him hole a yard putt. Tom has been through many trials. Three sons and a daughter has he buried, and now he is left a solitary figure, with his years heavy upon him, a pathetic sight indeed.

It should be said that, in addition to the story of Old Tom's golf, the book practically includes almost the whole of Young Tom's matches and triumphs. What a grand golfer he was those who read may learn. There are many who even now say he was the greatest of all, living or dead. As to that no one should even venture a guess. Conditions have so enormously changed that comparisons are to our mind impossible. All that we know for certain is that he had that vital spark of golfing genius which is vouchsafed to but few, and which puts them in a class by themselves. Like Mr Everard's book, the *Life of Tom Morris* is profusely illustrated and very well got up.

In the *History of the Glasgow Golf Club*, by Mr Colville, we are transplanted from the East to the West of Scotland. He has not, indeed, the advantages of Mr Everard, but he makes the very best of the material to his hand.

Apparently in the period when Glasgow was beginning to prosper—about the end of the eighteenth century—some of its more sport-loving citizens used to play golf by the banks of the Clyde on Glasgow Green. From what we gather golf was somewhat subordinate to good cheer and quaint bets, and was played under considerable difficulties. Still, the records give us an insight into the merchant life and joviality of a city since become the second in the Empire which cannot fail to be of interest to the reader. Business cares, however, choked the struggling game, and it died a natural death, not to be resurrected till 1870, when the Glasgow Golf Club was revived. It has gone from strength to strength, and now boasts of a home green—Killermont—easily accessible from the city, and a seaside course in Ayrshire—Gailes.

Of considerable interest, as showing how far men could drive with the feather ball, is the following extract from the minutes of the club:

'*11th April* 1786—We, John Dunlop and C. Corbett, at the request of Matthew Orr, Esq., attend this day at the Golf House to witness John Gibson strike five teed balls towards the first hole in the green, which done, the day being mild, with little or no wind, we measured the distance as follows: 1st ball, 182 yards; 2nd, 194; 3rd, 186; 4th, 201; 5th, 201. A rise towards the hole about 140 yards off prevented running. J. G., asked to strike off from the 1st to the 2nd hole, on nearly a level for 200 yards, when there is a slight declivity, drove a distance of 222 yards.'

As Mr Colville says, 'with the feather ball and on an absolutely unsophisticated course, this would compare well with the modern mighty things.' We should be induced to put it higher. How many men even now can average one hundred and ninety yards when conditions are not too favourable?

Mr Colville 'finishes his round' with a few well-chosen anecdotes. Fresh golfing stories are now ill to come by; but the following is, we fancy, original, and has plenty of Scots pawky humour:

Greenkeeper to irate party who was endeavouring to loft over a dike which crosses the course at Leven—'Wuz ye gaun the hale roond?'

Irate Party—'Of course.'

Greenkeeper—'We'll be needin' the links the morn.'

It is the spirit of modern golf which Mr Leach has captured and embodied in the clever series of golfing essays which he has aptly entitled *The Spirit of the Links*. Sometimes, indeed, he harks back to olden times, but he is more successful in his interpretation of the more modern golfing philosophy and science. In his opening chapters he strikes a melodious note. '*Spero meliora*' is the golfer's fine motto. Hope is the will o' the wisp which leads him floundering cheerfully through the bogs, bunkers, and pitfalls which beset him in every round, ever hoping to reach the Elysian fields, where the turf is soft and velvety, where every drive and every iron-shot is played to perfection, where no short putts are ever missed.

The missing of short putts gives the author ample opportunity to moralise: 'The history of every man's golf is covered with metaphorical gravestones as the result of all the short putts he has missed.' How true that sentiment is every golfer knows but too well. The man who never misses his short putts, those putts that our children find so easy, has never yet been found. Perhaps the cleverest thing in the book is the mental *recitatif* of the man who has to hole an eighteen-inch putt to win him the match. It is too long to quote here, but will bear careful perusal. It begins thus: 'This is a very simple job, and when I have holed the ball I shall be certain of my half-crown. Still, I must be careful. It is very easy to miss these putts.' It is a very human document, which must appeal to many of us.

We gather that *quoad* the 'Royal and Ancient' Mr Leach is somewhat of a revolutionary. He seems almost to hanker after a Golf Union. He foresees the possible day 'when combined associations, old established, firm, and powerful, may find that they are doing everything and St Andrews nothing. Will it not be an easy thing, and one which will suggest itself, to cut the knot that ties them to the old and respected guardian of our golf, and go forth with a new and revolutionary programme of government which shall include the very championships and the rules themselves?' Such speculations, we say advisedly, are useless and perhaps harmful. If such a movement as Mr Leach pictures should ever be inaugurated, it would mean a downright schism in the world of golf. We have not a vestige of a doubt that every club of note in Scotland, and probably the greater English clubs, would give their whole heartfelt support to the premier club; and the mischief which would eventuate to the game might prove irreparable.

We could go on giving extracts of golfing philosophy, statistics, and stories *ad infinitum;* but already this article is too long, and we feel we have trespassed on the patience of our readers. The advice we give is that they should read the books themselves.

TONELLI'S GOLD.

CHAPTER V.

FRIDAY morning came in due course. At five minutes past ten o'clock Amata, who was on the lookout for Santi's coming, saw him pass the shop window. Next moment the bell tinkled, the door was brusquely opened, and the Italian, looking as smiling, handsome, and self-complacent as ever, came in with his usual swagger. But at the sight of Amata, robed in black, with her colourless face and with an expression in her eyes such as he had never seen in them before, standing rigid as a statue on the threshold of the inner room, he came to an abrupt halt, caught his breath quickly, and said in a voice hardly raised above a whisper, 'Amata, what is the matter? What has happened?'

'My father is dead and was buried a week ago,' was the reply in a dry, strained voice.

He fell back a little way, the sudden shock of surprise finding expression in his mobile features. But as Amata, who was watching him keenly, told herself, it was surprise unmingled with any note of deeper feeling.

He stared at her in silence for a few moments as if hardly knowing in what terms to greet her tidings. Then, first taking off his hat and placing it on the counter, he went forward, holding out both hands. '*Carissima*,' he began, 'I can't express to you how shocked I am by what you have just told me, for I had learned to look upon my dear uncle as if he were a second father. And to think that I shall never see him again! Now that he's no longer with us, you and I must try to love each other even more than we have yet done. Say, sweet one, is it not so?'

She had seemed not to notice his extended hands, and he now advanced a couple of steps; but as he did so she recoiled an equal space.

'Do not touch me. I cannot bear it just now,' she said, with a note of restrained passion in her voice. 'My heart is racked, and if you begin to talk to me about love I shall hate you. Let a week go by, and then perhaps'—— She left her sentence unfinished. How strangely she was regarding him! It was indicative of their changed relations that she no longer addressed him as 'thou,' but as 'you.'

'Oh, well, just as you please,' he said a little sullenly, and with a shrug of seeming indifference.

'Your business abroad has gone well? You stated so in your note to my father, which I opened.'

'Yes, very well.'

'And the notes?'

Santi started. He had not given Amata credit for knowing as much about certain matters as it was now evident she did know. 'I have brought them with me, of course,' he replied.

'Yes,' said Amata. From her tone it was clear that she expected them to be given up to her.

'Here they are,' said Santi, as he extracted a small packet tied up in brown paper from an inner pocket of his overcoat. 'Would it not be as well to count them?' he added with a half-veiled sneer as he handed the packet to Amata.

She took the notes without a word and laid them on the table. Santi made as though he were about

to take off his overcoat, but she stopped him with a gesture. 'You had better go now,' she said. 'I have not time to talk to you at present. Come back at seven this evening, when I shall have something of importance to say to you.'

'Always yours to command,' replied Santi with another shrug. Then, when he had buttoned his overcoat, he held out his right hand as if to grasp one of hers. But Amata shook her head and put both hands behind her. 'I know you too well, Stefano,' she said, implying thereby that if she let him take her hand he would pull her to him and kiss her, by main force if needful.

Santi had not been gone more than two minutes before Neri made his appearance. He had been watching for the other's departure. At once the girl opened the packet given her by her cousin and handed the contents to Neri. At the end of five minutes he gave her the notes back.

'Signorina, they are forgeries, even as were those I examined for the *padrone* a fortnight since.'

'Thank you, Giuseppe,' replied Amata, without any visible sign of emotion. 'You have told me no more than I expected to hear. Margarita knows that I shall not need her to-day, but you yourself will come to me soon after seven this evening.'

Benedetto Capponi was the next to appear. He had found a customer for Tonelli's poor stock-in-trade, as well as for the homely furniture and other contents of the house, and presently a removal-van drew up in front of the shop. To watch the despoilment of the place which had been her home for so many years was more than Amata could bear to do; so she put on her hat and jacket and went out into the streets. When she returned after two hours she found the premises denuded of everything save a small table and a couple of chairs in the living-room, together with some crockery and a few kitchen utensils.

After making tea for herself, Amata sat down to the composition of a letter which, although of no great length, occupied her for the greater part of the afternoon before it was finished to her satisfaction. After that there was little for her to do save wait for the coming of Santi, who made his appearance on the stroke of seven.

'Oh, this vile English climate!' were his first words. A deluge of rain was coming down, and the wind was blowing half a gale. His eyebrows went up at sight of the empty shop, and he looked the surprise he felt on going forward into the living-room.

'What is the meaning of this?' he asked.

'It means that, as I am on the point of leaving England, I have disposed of the furniture and other things through an old friend of my father's.'

She had risen at his entry and was standing on the far side of the table. Santi had never seen her face of such a death-like pallor, but for some reason she kept her eyes half-veiled under their lids.

'On the point of leaving England! Do you mean that you are about to live for the future in Italy?'

'Yes, at Sorrento, where I have uncles and cousins.'

'But it was your father's wish that you and I should be married before'——

Amata held up her hand. 'But my father is dead, and that arrangement is now at an end. Besides, you no longer care for me as much as you did a couple of months ago.'

'Amata, I swear to you by all the saints in paradise that I love you as devotedly, as madly, as ever I did! I swear to you'——

'Enough!' said the girl in a tone that compelled obedience. 'I cannot listen to a word more just now. I am wanted below-stairs.'

'You are wanted below-stairs!' echoed Santi, looking as stupefied as he felt.

'You may come with me if you care to do so.'

After lighting a candle she passed through into the kitchen, in which were two doors, one of them leading to the yard, while the other opened on a flight of steps leading to the underground portion of the premises. Down the steps went Amata, holding her candle aloft and followed closely by Santi, who had taken off his wet overcoat and hat, and who was wondering more and more.

At the bottom of the steps was a door, which Amata pushed open, and a moment later Santi found himself in a spacious cellar, of the existence of which he had had no previous knowledge. Amata turned up a gas-jet, and he stared about him with growing amazement. It seemed clear that at one time the place had been used as a bakehouse, for there at one end was the yawning mouth of an oven minus the door. If the daylight had ever had any access to the place, it had none now. On a shelf fixed against the wall were ranged an assortment of glass jars and bottles of various shapes and sizes, the greater number of them containing differently coloured chemicals of a liquid kind, while others seemed as if they might hold powdered or calcined materials, the specific uses and values of which were probably known only to Tonelli, and, it might be, in some measure to his daughter.

But the object which attracted Santi's more particular attention was a gas-stove of an unusual shape planted in the middle of the floor, on which, supported by three squat legs, stood a circular iron pot or crucible, having a block-tin cover suspended about a couple of feet above it, connected with a horizontal chimney of the same metal, the farther end of which was carried through an opening of the brickwork into the original chimney of the bakery. The gas under the stove was alight, and the liquid in the crucible, whatever it might consist of, was apparently near boiling-point.

A few seconds sufficed for Santi to take in these particulars. He looked the mystification he felt.

'The liquid in this vessel,' said Amata, 'is the chemical compound in which my father used to

immerse his coins for a certain number of hours. What I want you to do is to keep on stirring it with this ladle while I fetch from upstairs the last packet of coins my father had in his possession.'

There was a tremor in her voice, which, however, he failed to notice. She gave him the ladle, and he at once began to stir the liquid, the bluish fumes from which mounted into the lid, and, passing thence through the chimney, found their way into the open air.

At the foot of the steps Amata halted for a moment and glanced over her shoulder. As she did so a peculiar convulsion passed over her features, leaving them livid. '*Addio*, Stefano!' she murmured. Then she passed out and shut the door softly behind her.

Santi, busy with his ladle, had his back to the door. This surely was the 'magic bath' about which his uncle had spoken to him!

The wind was increasing in fury. The crazy old tenement trembled under the impact of its blows. Suddenly there was a crash of falling slates and débris close at hand.

Not more than two or three minutes had gone by before a slight noise behind Santi caused him to turn his head, and then, to his amazement, he saw that what looked like a folded paper had been thrust under the door. At once he hastened to pick it up; and, putting down the ladle, he crossed to the gas-jet. There, written in Italian, he read as under:

'Stefano, all is known to me. The notes you brought after your Amsterdam journey and those after your last journey are forgeries. Your intention was to enrich yourself at my father's expense. But for you he would have been alive now. It was the discovery of your villainy that killed him.

'To me you swore—what? You cannot have forgotten what! You poured hot words of love into my ear, and I—weak fool that I was!—believed you. You tainted my lips with your false kisses, when, had I but known the truth, I would sooner have thrust a knife into your heart; for since then I have seen and talked with your wife—when and where matters not.

'The wrong you have done me is beyond forgiveness, but that I have known how to avenge myself you will find when you see once more the light of day. AMATA TONELLI.'

The paper dropped from Santi's fingers and he stood for some moments like a man transfixed. All was known to her! That he would have to pay the penalty of his wrong-doing he did not doubt. Like himself, Amata was an Italian, and, as such, revenge with her had all the force of a sacred obligation. The question was, what form would her vengeance take?

He sprang to the door, only to find it proof against all his efforts to open it. He called Amata by name again and again, only to have his voice choke in his throat the third time he did so. Why should it do that? Turning from the door, he saw, to his horror, that the smoky fumes from the boiling liquid in the crucible, instead of ascending and being carried off through the chimney, no longer found an escape that way, but were spreading and filling the underground room. Already Santi was conscious of a peculiar constriction of the throat. He sprang to the stove with the intention of turning off the gas, but his frantic efforts to find the tap were unavailing. Choking and gasping for breath, he staggered aimlessly about the cellar. There was a whirling in his brain and a roaring as of many waters in his ears which momentarily grew louder. He beat the air wildly with his hands and tore madly at his throat. His brain was becoming clouded and he was conscious that his senses were deserting him. Minute by minute the poisonous acrid fumes from the crucible grew in density.

The end was at hand. The unhappy man, no longer able to stand upright, sank to the ground, and with a last effort crawled towards the door. Suddenly he rose to his knees, and on the instant his body became rigid. For the space of half-a-minute he swayed to and fro; then, with a low, gurgling cry, he rolled over, after which he stirred no more.

Meanwhile in the room upstairs Amata and Neri sat and conversed in low tones. As the crash of the falling slates smote their ears they gazed at each other in silence for some seconds, and then resumed their talk.

Five minutes might have passed, and then Amata sprang to her feet with an inarticulate cry.

'*Che posso fare?*' queried Neri, as he rose and pushed back his chair.

She did not answer, but with hands that visibly shook she lighted the bedroom lamp, and then turned off the gas at the meter, and flung open the door into the yard and the kitchen window. Then going back to Neri, she said, 'Do you not smell something?'

'*Si, signorina.* What is it?' He looked not merely surprised, but somewhat alarmed.

Again she did not answer, but crossing to the chimneypiece, she leaned her crossed arms upon it and let her head droop upon them.

Neri respected her silence and resumed his seat. By this time the air of the room had become disagreeably impregnated with the nauseous fumes from below, which had made their way under the door and so up the staircase. But at the end of ten minutes the atmosphere had comparatively cleared.

Then Amata left the room, only to return a minute later. In that time she had been down the stairs, had pushed back the bolt and opened wide the door, then hurried back to escape the rush of poisonous gas which otherwise would have overcome her.

After another space of silence she said to Neri,

'Follow me;' and with that she took the lamp and went down once more to the underground room. She went in slowly, with Neri close behind her.

Santi lay on his back, with extended arms and wide-open eyes. By the flickering lamplight his features seemed distorted into a sardonic grin. Amata cast one shuddering glance at him. She wanted the note she had thrust under the door. It was there, within a yard of the dead man. She picked it up, and without another glance behind her hurried from the spot.

When she and Neri were once more in the living-room she said, 'As you know, I never intended this to happen. On the shelf there was food and a bottle of wine, and at the end of twenty-four hours, by which time I should be far away, you were to give him his liberty. The chimney must have become choked by some means, so that the fumes from the crucible had no way of escape.'

And such proved to be the case. Each opening of the chimney-stack was crowned with four heavy slates set upright in mortar. These the force of the gale had uprooted, hurling most of them to the ground, but leaving one lying flat on the opening from the old bakery.

That night Amata slept under Neri's roof.

By ten o'clock next morning she was again at Santi's lodgings in Upper Holloway. She was before the time that had been previously arranged for, and Santi's wife could not help showing her annoyance at being surprised in an old dressing-gown and with her hair in curling-pins; but her manner changed when Amata, without preface, said to her, 'I have come earlier than the hour fixed upon in order to tell you that your husband is dead.'

Although the woman's cheeks blanched, it seemed as if in the course of the next few minutes she became five or six years younger.

'Oh miss, are you really and truly telling me the truth?' she gasped.

'I swear to you by all I hold sacred that Stefano Santi is dead. His death was the result of an accident. But you must ask me for no particulars, because I can tell you none. You will now be free to marry the man you jilted, but whom you say that you still love and who still loves you.'

'Ah!' breathed the woman softly, and the light as it might be of a new-found joy shone suddenly in her eyes.

'There will be no occasion now for you to go out and join your brother in Australia?'

'No, I suppose not. In fact, I'm sure not.'

'And our bargain about the child still holds good?'

'Of course, miss. It's a sure thing that when we're married Phil won't want to be bothered with him.'

'How soon can I have him?'

'I'll have him bathed and got ready at once, if you care to wait.'

Amata's previous visit to Holloway had resulted in a bargain between her and Santi's wife. The latter was desperately desirous of absconding from her husband and of going out to a brother in Australia. All she lacked was her passage-money and a few pounds for her outfit. Thereupon Amata had offered to give her a hundred pounds in exchange for the child, for it was already clear to her that Luigi's mother had little love for him. The offer was accepted with ill-dissembled joy.

An hour later a hansom set down Amata and the child at the Holborn terminus, where Neri was waiting with a trunk containing the girl's few belongings. She looked a different Amata from the listless and heavy-eyed being he had seen sitting at the breakfast-table two hours earlier. By what magic had the change been brought about?

She would not part for a moment from the child, whom she seemed to regard as a priceless possession. Carrying him in her arms, she booked herself by the Calais boat-train through to Naples. Some minutes later she was waving a farewell to Neri as the train drew out of the station.

As the coiner turned away he saw everything as through a mist.

THE END.

HOW FRANKLIN TRIED TO ANNEX CANADA.

IN these days of Imperial or Colonial Conferences, it is curious to recall Benjamin Franklin's attempt to annex Canada to the United States as a kind of solatium for all the trouble and distress brought upon his countrymen by the errors of George III., Lord North, and the 'tea-destroying Indians of Boston.'

To-day we have Sir Wilfred Laurier in London telling the British public of the ardent desire of his countrymen to uphold and support the prestige of the Empire; a century and a quarter ago we had the erstwhile printer and Deputy Postmaster-General of the United States calmly pressing on Richard Oswald, the British Commissioner, who arranged the terms of peace after the American war, 'that as he had already expressed an opinion that the French did well to cede Canada to us in the previous war, it would be a "sweet" thing, a "reconciliation," if the British Government should voluntarily offer to give up the province of Canada on condition that Britain shall have and enjoy at all times the right of *free trade* thither, unen-

cumbered with any duties whatsoever; that so much of the vacant lands shall be sold as shall raise a sum sufficient to pay for the houses burnt by the English troops and their Indian allies, and also to indemnify the Royalists for the confiscation of their estates.'

This maker of terse but true sayings, who had been laughed out of the Privy Council Chamber a few years previously, when he appeared with a petition for the removal of the Governor of Massachusetts, had now the effrontery to suggest further that if Canada were given up it would prevent occasions of quarrel by England continuing to hold it, hinting at the same time, but not expressing too plainly, 'that such a situation, to us so dangerous, would necessarily oblige us to cultivate and strengthen our union with France.' Truly, 'Poor Richard' was having his revenge for the years of contumely which he had suffered in London.

Luckily for the British Empire, perhaps even for the United States, the French Ministers of State had hopes that their old colonies around Quebec might in time, with their other colony of Louisiana, form the nucleus of a successful colony under the French flag; and, although they were willing to lend six million francs to Franklin's fellow-colonists, they were not going to help in what Franklin so quaintly called 'a *sweet* thing.'

Again and again Franklin returned to the charge. He had a favourite maxim 'that a man should not *seek* office, but having taken it, should not *resign* easily.' Evidently he carried this maxim into practice in diplomacy, never to resign an advantage; for he so pressed Mr Oswald for a settlement of the question of Canada that he had to go to England to consult Lord Shelburne. On his return he asked Franklin 'not to press the matter, but that it was probable he might get satisfaction at the end of the treaty'—that is, Paris, 1782. In this way, with the help of the French, 'Our Lady of the Snows' was saved for England.

The world owes much to Franklin besides his 'lightning-rod;' but the United States have not had a more astute ambassador in Europe since his day. An ambassador was commonly said to be a gentleman 'who *lies* abroad for his country's good;' but Franklin seems to have been one who spoke the truth vigorously and to the point, and had no small opinion of himself or of the 'solatium' for damage done to his countrymen.

THE PARSON'S KNOT.

By Owen Oliver.

THERE was a space of still water round the *Uralian*. One reef sheltered her as she lay upon another, straining and groaning like a beast in pain. Her bows had climbed over the hidden rock, pointing scornfully upwards till they had bent with their own weight and sagged downwards again. Now the forecastle was half-submerged, and the water poured in and out through great rents. The ship was twisted amidships, the deck-planking had opened in places, and part of the music-saloon had fallen in, but the stern was uninjured and lay in deep water. They carried the boats aft that were available and launched them there.

Beyond the oasis of calm, a heavy sea swept shorewards in towering green waves until it reached a comb of jagged rocks, and poured through the openings in sheets of foam to a long sandy beach. Three tossing boats were approaching the rocks as slowly as the current would suffer, looking for a passage through; the fourth, the last remaining, was just leaving the ship. The men, who had lowered it with no appliances but bare ropes, rubbed their chafed hands on their trousers and mopped their foreheads, and gathered together silently, except a tall gentleman of about forty. He left the others and went towards a lady who stood back a little, watching them. The rest of the women and all the children were in the boats. She turned when he reached her, and they walked forward together. He patted her shoulder approvingly, and she smiled faintly at him. She was about five-and-thirty, scarcely good-looking, but very likeable when she smiled.

'*That's* why she wouldn't go in the boat!' one of the gathering observed.

'Ay,' said an old sailor, 'she's the right sort.'

Then they were silent again.

The man and the woman were silent too. When they reached the end of the saloon promenade, beside the wrecked music-saloon, they stopped and rested their arms on the rail and gazed at the shore a mile away—not as if they wished to look at the shore, but as if they feared to look at each other. The chief officer came swiftly down the narrow ladder from the navigation-deck with two life-belts on his arm.

'Best put them on,' he advised; 'but I don't think they'll be much use.' He nodded towards the breakers. 'She'll go in ten minutes.'

The man laid one belt on the deck while he put the other round the woman. She held up her arms and smiled at him all the time. When he was finished with her, and picked up the other belt, she took it from him.

'Let me do it for you,' she offered. 'I should like to.'

His grave face lit up for a moment. 'I shall like you to,' he told her. 'You are a brave woman.'

'Braver than I thought,' she assented. 'I used

to think that I was just ordinary—that we all were. Now I think it was life that was ordinary, not we. What shall we do with the rest of it—the ten minutes?'

'Let us open our hearts,' the man proposed. 'We may venture now. Dear lady, I have admired you and liked you all the voyage. We shall go as friends together, I think.'

'I wish no better company,' she told him.

'Is there no one who has a better right?' he asked.

'No one. And you?'

'No one.'

'And that,' she said, 'is why we thought life ordinary, I suppose.'

He nodded, and they rested their arms on the rail again and gazed at the boats approaching the shore. There were only two of them now—no, three. One lay upturned on the beach. Specks of humanity crawled out of the foam. Some rushed back at the risk of their lives and pulled out others.

'Yes,' he said, 'we are braver than we thought. Do you see the bounder-man, as we call him?' He pointed to the group at the stern. 'One might have expected him to fight for a place in the boats. When I saw him carry the first child down I thought it was an excuse to get a place for himself; but he carried half-a-dozen more down and came back cheerfully every time. He managed to cheer them too, wiped their eyes and joked at their fears in his own way, got some packets of sweets from the bar and threw them down to the boat, and kissed his hand to them. Now he's lighting a cigarette. Yes, we're braver than we thought. *You*, dear lady, are the bravest and the best. You gave up your life when you gave up your place in the boat. Why?'

'The children have no mother,' she explained; 'and he is such a good father to them. They need him, and I have no one.'

He took her hand. 'You have a friend,' he assured her.

'Yes,' she said simply. 'That was the other reason why I remained.'

'Me?' He looked at her quickly.

'You. I wonder—it doesn't matter what we say now, does it?—I wonder if we really cared for each other.'

'Ah!' said the man, 'I wondered too; but I thought women always knew.'

She shook her head. 'I liked you, certainly; but I have liked other men. I never liked any of them enough. You see, I am not a marrying woman. I have—I *had*—aims in life. Marriage meant sacrificing so much. It *is* a sacrifice for an independent woman to give up her individuality, to be Mrs Something-Else—not even her own name left! And for what? To be a toy and a plaything for a year. Perhaps not a year. Don't call it selfishness. I'd have given up everything if I had thought that love would last. My dear friend, it doesn't last. You and I are not children. We have seen life. We know! But the woman's lasts longest. I was afraid of *that*.'

'I know.' The man nodded. 'I liked you too—liked you more than was comfortable. I thought it out many a time. It was more than liking or esteem, Marian. I quickened at your coming, warmed at your beautiful smile.'

'Dear friend,' she protested, 'we can be candid now. You know that I am not beautiful.'

'Indeed!' he declared. 'I thought you were. It was yourself that I liked, but I liked your woman's graces too. You are smiling very beautifully now.'

'If it pleases you,' she said, 'I will smile to the end. I am glad that my looks please you. Will it make this—this moment of your life happier to know that I admire you? I do.'

He nodded. 'Thank you, dear woman. I was very tempted sometimes to ask you to give me yourself; but—— You see, I was a successful man, and a clever man—I may say that now—and I had a career before me; and a man may find marriage a sacrifice too. I also have liked others, and not enough. I, too, was not sure if I liked *you* enough; but I liked you more than any of the rest—much more. Sometimes I pictured you at my breakfast-table, in a cool morning-gown, your white fingers busy with the cups. But I was forty and more, and you were forty and less. The married breakfast-table is not always harmonious, and we were a little old to adjust ourselves to double harness; and so—— Well, I didn't think so much of the risk of quarrels. We might have had a few hot words now and then, but *they* don't matter. It was the *cold* words that I feared. To love you—and I knew that I should love you very much—and then to slip back! To be loved by you—if you *could*—and then to be loved by you no longer! To turn into the ordinary married pair, to live our separate lives—and a chain between!'

They gazed out over the water again. Another boat dashed safely ashore. They fancied that they heard a shout from the beach.

'He and his children are in that,' the man said. 'You would have been saved. Oh, you brave, good woman! You were worth taking the risk for.'

'But you did not mean to take it.' She brushed her eyes.

'I told myself so; but I used to fancy that some night when the moon shone, some night when the end of the voyage and the parting from you were nearer than I could bear, and you looked at me with your beautiful smile—— I could never reason with that smile of yours, Marian.'

She turned to him and smiled, and he took both her hands and kissed them.

'I did not mean to either,' she confessed; 'but I too thought that perhaps, near the end of the voyage, as you say, if you took my hand—— I could never reason with the touch of your hand.

I—oh yes! I should have taken the risk, I think, if you had asked me.'

He drew her gently to him. She laid her face on his shoulder for a moment, then lifted it to his.

'Oh, my dear!' she cried, 'the risk was not that we should not love, only that we should lose sight of it in the commonplace of life. Now, if we are spared, we shall know'——

'We shall know, darling. There is no hope, I think. May we both be saved, or neither.'

'Yes, yes! Hold me very tightly when—then! Oh, I love you so!'

He took up a piece of cord that lay upon the deck and made a fastening between the life-belts.

'If my arms can no longer hold you,' he said, 'we shall still be together. It shall be both or neither. I think it will be neither. I love you very much, Marian.'

He kissed her many times, and she smiled the beautiful smile.

'Close your eyes then,' she told him. 'Think of me like this, as you like to see me. Think that *afterwards* you will find me so. Dear, I was not always sure that I believed in afterwards; but now that you love me I am sure. "Love holds the key of heaven." I wrote that once in a book—a book—now you have written it on my life. This is the time that I have *lived*, these few minutes!'

'My dear! my dear! it is so hard.'

'No, no! We have found each other, and perhaps if we had lived the ordinary life we never should have. This is best.'

They clung to each other tightly. They did not stir even when the ship gave a long shiver, and another.

Then the chief officer hurried forward. 'Get aft,' he cried; 'get aft! There's a lot of powder in the hold. The captain's going to fire it and try to blow her up. It will break her in two; but he thinks that the stern will float off, and if the water-tight compartments hold we shall reach the breakers before we ground. She'll break up then, and we shall have to swim or float; but we sha'n't have so far to go, and the boats got through the rocks, and why shouldn't we?' He laughed in the careless way of sailor-men. 'I'll come to your wedding yet,' he said. 'God bless you!'

'God bless you, old chap!' said the man.

'God bless you,' said she—'*all* of you!'

'Now, hurry astern,' the chief officer advised, and turned away.

The man caught him by the arm. 'Where are *you* going?' he asked.

'I'm going to fetch the old man. If I don't I believe he'd blow up with the ship. Look sharp! I expect he's fired the train by now.'

'Then *you*'——

'Mustn't wait any longer,' said the chief officer with another laugh; and he broke away and ran, and they turned and walked astern. She clasped her hands over his arm.

'Oh,' she cried, 'if this is the end it was worth living for! Life is better than I thought, and braver. They have *all* been so brave. I will never despise any one again—not even a bounder-man!'

The bounder-man held out his hand to them when they reached him. 'Good sports!' he said, smiling at their locked fingers.

An hour ago they would have thought him a vulgar intruder. Now they shook his hand warmly.

Presently the chief officer appeared, almost dragging the old captain with him. The latter seemed to have no eyes for anything but the doomed ship. It was like a child to him, and he had no other. Ah, we all have dear ships that go down!

The vessel shivered again, and heeled over slightly. They looked anxiously at one another, thinking that she would sink before the powder exploded; and then, suddenly, there was a great crash. Boards, bales, and the whole music-saloon flew into the air. The bows seemed to dissolve, and the stern took a great lurch into the water. The waves swept over it for a few moments; but when they passed it floated upright, and its human freight was left clinging to the rails—except the captain.

The chief officer rubbed his drenched sleeve across his wet face. 'He'd have wished to go with her,' he said huskily.

'Yes,' said the bounder-man. 'Yes, I can understand that.'

And they did not think it strange that he should understand.

The fragment of ship swept unsteadily towards the shore, rocking and rolling so violently that those on it could scarcely cling on to the rails. First they hung over the water, then they faced the sky—a clear, blue sky, with a white cloud here and there. At every roll they sank lower in the water.

'The compartments have broken in,' the chief officer pronounced. 'She's filling.'

'Still, we get a run for our money,' the bounder-man consoled him.

As the stump of ship filled and sank farther it rolled less; and they came into a current which carried them straight towards the shore, nearer and nearer till they could distinguish each of the jagged teeth of rock sticking up through the seething foam and see others just underneath it. They inferred that between these there were more that they could not see, though no one said so.

'We shall reach ground,' the chief officer prophesied—'just reach ground.'

They looked doubtfully at the water coming nearer and nearer to their feet, and held their breath.

At last the water reached the deck and began to wet their feet. Then there was a harsh, grating sound, and a jerk that threw several on the deck, and the stump of ship rose two or three feet out of the water. They were fifty yards from the rocks where the sea broke, and perhaps a hundred and fifty from the shore.

'I suppose we may as well jump over and take our luck,' the bounder-man suggested; 'but it's ten to one on those rocks. Hanged if it isn't!'

They stared at the black masses jutting up between the green sea and the seething foam that raced to the shore.

'They're awkward,' the mate admitted—'*confoundedly* awkward! If we could get through *them* I'd bet ten to one on the lot of us reaching the shore alive. You *can't* drown in half-a-minute. Well, *some* of us will get through. It's the only chance. Take a long breath before you start.'

'Can't you get a rope ashore,' some one asked, 'as they do at wrecks, so that we could go down it?'

'Ye-es,' said the chief officer, 'I might get a rope ashore; but you couldn't hold on. I've no cradle to run up and down it. No, you'll have to jump. Who'll go first?'

The man and the woman looked at each other.

'We will,' he said.

'You'd better go singly,' an old sailor advised. 'There'll be more chance of slipping between the snags, you see. If you're tied together and one gets caught you'll both be done for.'

The bounder-man slapped him on the shoulder.

'And suppose that's what they wish?' he said. 'Eh, my old sport?'

'Ah, ha!' said the old sailor—'ah, ha! that makes it all the more pity.' He looked at the cord which fastened them together, and suddenly he laughed excitedly and turned to the chief officer. 'The very idea, sir!' he said. 'If you got a cable ashore we'd sling 'em over it in pairs—let the rope between 'em slide down it, don't you see, and they could hold on to each other and keep it from slipping off.'

The chief officer and several of the men rushed away, and came back with twine and ropes. They fastened some balls of twine together and bound one end round a plank. Then they threw the plank overboard, and the current carried it swiftly towards the rocks. It struck one of the snags and leapt violently into the air; then it went on to the beach, and one of the sailors secured it and waved his arm.

'Ah,' said the old sailor, 'that's Bill! *He* understands. He was a lifeboatman once, Bill was. Look, he's telling the rest!'

He waved his arm in reply, and fastened on a thin rope, and the men dragged it ashore by the twine; and then by the line they pulled in a stout hawser—several hawsers joined, really. All ashore, even the women and children, assisted to haul, standing in a long row. Then the men held the end, and the women and children held the line attached to it. Those aboard secured their end firmly to the ship, carrying it up to the stanchions of the platform round the captain's cabin to give it as much elevation as possible; and then their comrades ashore pulled it as taut as they could, tugging so hard that the poop of the ship moved yards nearer the breakers. The sailors substituted a stouter rope for the cord between the man and the woman, and greased it in the middle to make it run more easily. They put it over the hawser first, so that one would hang at each side, and told them to hold each other firmly. Then two or three men held them over the side ready to start.

'Now,' asked the chief officer, 'are you ready? Go!' he cried, giving them a mighty push; and they slid swiftly down the sagging hawser through the drenching foam that sprang up from the rocks and nearly took their breath away, holding each other more and more tightly and rocking swiftly from side to side.

At first they went very fast, but as the rope sagged their motion was slower and slower; and though the rope between them passed over the joins in the hawsers, the obstacles checked their speed. Then their feet dragged in the foam, and they moved very, very slowly, till at last they stopped. Then the men ashore gave little jerks to the hawser, and they moved on a few inches at a time; and then the current began dragging at their feet, and the oldest sailor ashore yelled out sharply, 'Lower 'em! lower 'em! The current'll fetch 'em!' And suddenly they splashed in the water, and the foam flew all over them; and a sailor waist-deep in the water, and holding to others in a chain, seized them and dragged them on to the beach. And without waiting to be untied they joined the rest in hauling at the rope for the passage of the next pair, who were already at the ship's side; but as they pulled they kept smiling at each other.

'Oh,' she whispered once, 'and we thought life ordinary!'

All their friends were ashore at last. The chief officer and the bounder-man were the final pair, and arrived a couple of minutes before the remains of the old ship broke up and disappeared. They were heavy men, and swung their legs and landed unaided with a run; and then a sailor cut the couples adrift. When he severed the only lady from her companion he grinned.

'The next time you're tied up,' he prophesied, 'it'll be a knot that can't be cut—a parson's knot.'

And the bounder-man beamed on them benevolently. He felt as though he would like to lend some one a dollar, he said. 'I'll go and see it done,' he asserted, 'whether I'm asked or not.'

Three weeks later, when a passing steamer had carried them off to England, he was asked, and went. He gave the bride a wonderful gold ornament fashioned like a fragment of rope tied in a sailor-like way. 'The parson's knot,' he informed them.

And the chief officer, who was asked too, took it up and smiled. 'We don't call it that,' he said. 'We call it "a true-lovers' knot."'

'That,' said the bounder-man, 'is what I want it to be!'

SIXTH SERIES.

THE HEART OF THINGS.

By Henry Leach.

London, *Feb. 20th.*

THE conversation among a group of political persons turned the other evening, naturally enough, upon the hard life that is inflicted in these days upon the Prime Minister of the country, and it was held with positiveness that the present system is such that it is impossible for the nation to derive the best benefit from its chief statesman, or even, in the ordinary course of events, to get any benefit at all from him for any adequate length of time. By this it was meant to say that no man fairly advanced in life can stand the physical strain of premiership for more than a very few years, with the result that he has no sooner become well experienced in his office and best fitted for the good service of the State in the most responsible of all positions than his strength deserts him, his capacity fails, he must seek rest at home or abroad, and there has even to be resort to some desperate expedient in order that the State may continue to get any more work at all out of him. In the course of some fifty or sixty years the country develops a capable Prime Minister, and then, as it were, kills him off in five. The evolution of our governmental system has constantly had the tendency of throwing more work and more responsibility upon him, until at the present time the office is almost an impossible one. It is necessary for him to decentralise himself, so to say, as much as possible, and delegate to subordinates duties of the first importance which he would prefer to undertake himself, and should do, but simply cannot. Thus to his general worries are added those of a constantly uneasy conscience, dissatisfaction with duty done, and fear for what may happen. What is needed is that the Premier in these days should be expected to be less a Manager of Parliament, less of an acting Chief Public Orator, called upon to make speeches at innumerable and most diversified functions, and less of a Principal Politician. He should be simply and almost solely the Acting Manager of State in a position corresponding somewhat to that of the President of the French Republic. Below him he should have a Manager of Parliament. We approach a little way towards this ideal when our Prime Minister is in the House of Lords; but there is the anomaly and difficulty at present that by the existing system the premiership is most effective when it is exercised from the Commons, and that the chief statesman generally only seeks the Upper House when he feels that his strength has become impaired with age and overwork, and that the best has gone out of him. Clearly this is not a good arrangement. In the old days our forefathers used to have younger Prime Ministers, who could stand more hard work and strain, but from whom, nevertheless, there was comparatively little expected. The younger Pitt, when he was Prime Minister, might drink his two bottles of port at night and not rise from his bed until eleven o'clock in the morning, for his parliamentary duties made quite a light tax upon his time (though even he 'died of old age' at forty-six); and as for other duties, it is on record that he only delivered two public speeches outside the walls of Parliament during the whole of his political life, and these were of such extreme brevity that they would have made but insignificant paragraphs in our morning newspapers even when reported to the full. Never afterwards did the chief Minister have such an easy time as that. The duties increased and multiplied surely and steadily until by the latter days of the nineteenth century they had become well-nigh overwhelming; so that when John Bright once went to Mr Gladstone and expressed some qualms of conscience that he had in taking a salary for a ministerial office to which he had been appointed, the Prime Minister answered with a shake of the head, 'There, Bright, I don't agree with you a bit; and for my part I had rather take my official money than anything I receive from land, for I know I have earned every penny of it!' Yet, it may be said in passing, it is a little curious that there is no salary whatever for the Prime Minister as such, and he would be without pecu-

[*All Rights Reserved.*]

niary reward were it not for the fact that he takes to himself another office where the work is paid for, generally that of the First Lord of the Treasury, with its salary of five thousand pounds; but so chary are we of overloading our Premiers with riches that long since it was enacted that if any of them should play the treble part of Premier, Chancellor of the Exchequer, and First Lord, as has many times been done, they must do so at a specified reduction. Little wonder, then, it is declared that no Prime Minister has ever become a rich man while in office, that one of them—this being Lord John Russell—said himself that he never had a debt in his life until he became First Lord of the Treasury, and that when Spencer Perceval was murdered the estate he left behind him was so extremely meagre that Parliament had to come to the rescue of his bereaved family.

* * *

If the duties of premiership were heavy in the days of Mr Gladstone, they were nearly as arduous for a long time before that, and they have certainly become more so since. More than sixty years ago, Peel, then a recently fallen Minister, remarked to Gladstone, when the latter called upon him, that he had been twice Prime Minister, and nothing would induce him again to take part in the formation of a Government, the labour and anxiety being too great; and then he went on to say, 'No one in the least degree knows what it is. I have told the Queen that I part from her with the deepest sentiments of gratitude and attachment; but that there is one thing she must not ask of me, and that is to place myself again in the same position. There is the whole correspondence with the Queen several times a day, and all requiring to be in my own hand, and to be carefully done; the whole correspondence with Peers and members of Parliament, as well as other persons of consequence; the sitting seven or eight hours a day listening in the House of Commons. Then I must, of course, have my mind in the principal subjects connected with the various departments.' And so forth. After the interview which Peel had with the Queen on the occasion mentioned, Prince Albert made a memorandum that 'he is evidently much relieved in quitting a post the labours and anxieties of which seem almost too much for anybody to bear.' Doubtless, the scope of the private secretary has expanded since those days, and different Premiers have found special means of lightening the demands of correspondence which Sir Robert took so conscientiously. Mr Gladstone used to say that the invention of post-cards had prolonged his life. But, considering all its points, it is still the hardest task in the State, and we must come to the conclusion that we use up our Prime Ministers too quickly.

* * *

Every now and then there is a crisis or an upheaval of a kind in the inky world of Fleet Street, where all the news of the world gets concentrated hourly, and whence it is radiated again to all whom it may or may not concern. We had one of them lately, and it was of much moment. Not that, to be strict, the headquarters of the *Times* is in Fleet Street, but that which we continue to regard as the chief newspaper is of Fleet Street, as one might say. Hitherto it has largely, though not entirely, held itself independent of modern tendencies and revolutions in journalism. There are other newspapers in London that have traditions almost as rich and lofty as those of the *Times;* but it is as if the extra traditions of its own locality in Printing-House Square had hung round it, holding it staunch, conservative, and immune from too much modernism; for where the paper is printed there was once the old Friars' Chapterhouse, and a century and a half back the King's Printer had his office in one of the buildings. One of the offices stands where stood long ago the London house of the most ancient family of Manners. Step back from the busy thoroughfares of the City—and but a hundred yards away there is said to be the most dangerous crossing in the whole of London town—into the court which is in the middle of the buildings, and even now you seem to go back a century of time. Through many vicissitudes the old Walter family management has stood fast by the great journal, and it is largely for this reason that the feeling has been encouraged in the public mind that the *Times* had a great soul that was superior to all considerations of monetary profit, that it would go on and on in the exercise of pure conscience as it had done, and thus its position as the great national newspaper was firmly fixed. For many decades past the *Times* has been not merely a London newspaper, but the national recorder and the world critic and censor, and respected the whole world over as such. A new and revolutionary era in the history of the newspaper now arrives in the introduction of an outside and extremely modern personal element to its management; but it is far from being allowable or proper to imagine that this is not good for it in all respects. Had the *Times* languished it would have been bad all round, and the modern time is, after all, not so poor in conscience and the modern journalism not so short of principle that there need be fear for the future of this great national instrument of thought. It and its new leaders have well-wishers everywhere.

* * *

It is an odd fancy that as the *Times* is virtually the last to yield to the modern spirit and method of journalistic enterprise, it was the first to do so in another far-back era of newspaper production; for in all the world it was the first newspaper to be printed by the aid of steam, and this innovation was not then performed without some desperate courage and risk on the part of John Walter the Second, who was then in command. About the beginning of last century the paper had a circulation of only about three or four thousand

copies a day, and by the laborious hand process it took many hours to print even so few. Mr Walter was so eager to gain a new and quicker method of printing that he kept a very intelligent inventor of the name of Martyn on his premises with the single but sufficient commission to invent an improved and quicker printing-machine, and the man seemed almost to have succeeded when the pressmen conceived him to be their deadly enemy, and threatened him so much that he had to retire. But some time later another man of the name of König came along with a new patent printing-machine, and Mr Walter secretly housed it and him and an assistant named Bauer in some adjoining premises where during many months the invention was slowly perfected. At last it was determined that the great epoch-making experiment of printing the paper by steam should be made in the early morning of 29th November 1814. It was written by Mr Walter's biographer that the night on which this curious machine was first brought into use in its new abode was one of great anxiety and even alarm. Destruction to any one whose inventions might suspend their employment—'destruction to him and his traps'—had been threatened by the suspicious pressmen. That night they were told to hold their services back awhile for expected news from the Continent; but at six o'clock in the morning Mr Walter himself made a dramatic entry into the pressroom with a paper in his hands, and astonished the men by remarking to them quietly that they would not be wanted any more that day, the *Times* being already printed by steam; that they would be unwise to attempt any violence, as precautions had already been taken for its immediate suppression; but that if they were peaceable each man's wages should be continued until he could get other suitable employment. Thereupon Mr Walter distributed among them several copies of the newly printed paper, containing a leading article in which was given an explanation of the process by which this remarkable departure in the method of printing had been accomplished, and wherein the editor animadverted also on all that it meant to the Press and civilisation in general.

* * *

Like all others that are of any age, the journal has had many stirring periods in its history since those far-off days, and there will be many more to come, for never were the times so interesting, even exciting, in the newspaper world as they are to-day. And a thing that is impressed upon one in the present era is that those sour old pessimists who constantly talk with such glibness about the decadence of the Press, in which they can see nothing but unhealthiness, must often be blind to the magnificent good that it is constantly doing—good for the honour and the welfare of the nation, and often enough good that should have been done by Government officially if it had not been too neglectful of important matters involved. In this respect we have lately had a striking object-lesson furnished to us by another great journal in the *Daily Telegraph*, which by its own efforts collected together the old soldiers who saved the honour of the country in the dark days of the Indian Mutiny, and on a great anniversary fed them and made them happy as they had not been for many a weary day. And having done so, it exposed to the nation the scandal that in many cases these old warriors, to whom England owes so much, had to leave the banqueting-hall to go back, not to happy homes where their wants were provided for and their comfort in declining days properly attended to, but to the workhouse! It is a melancholy state of things, and there is something greatly humiliating to the nation in the revelation that has been made. The only grain of comfort to be derived from it is in contemplation of the circumstance that we still have a Press that can play the unforgetting part.

* * *

During the last year or two there has been a considerable and commendable vogue for volumes of reminiscences of the early and middle Victorian period, and the result has been the publication of some most entertaining literature calculated to attract the attention of readers who seldom display taste in the direction of works of biography or of a semi-historical character. What one might call the advantage of memoirs of the period referred to is that they concern the lives of people and events of which our own senior relatives have first-hand knowledge, and which for this and other reasons of a like character seem to be just on the fringe of our own experience. The footprints of the heroes and heroines are still on the paths, and in reading of their doings there is no feeling that the work in hand is historical study, which, to some minds at all events, is a considerable relief. But though this time is so near to us that we can sometimes reach it with our living families, how much changed have life and manners become in the interval, so that these accounts of Victorian sayings and doings have a charm and a piquancy which is delightful! It may be that it is only because we follow in the custom of generations by underestimating the richness of the present time; but it does occasionally seem from such reminders as have been afforded us that there was somewhat more colour and more body in life in those days than we get in it now. Of all such works that we have encountered none have been more fascinating than the volumes of reminiscence that have been furnished by that most cultivated and talented gentlewoman Lady Dorothy Nevill, who was a social magnet in that period of which we have been speaking, and who had intimate association with all the notabilities of the time, from which her keen intellect enabled her to derive the utmost advantage and pleasure. The most recent of these volumes (*Leaves from the Note-Books of Lady Dorothy Nevill*, published by Macmillan) is full of the most delightful recollections and

original anecdote, varied by pointed reflection. Especially is Lady Dorothy interesting when, as frequently, she is writing upon matters of art and the treasures and collections thereof. One story about the first Sir Robert Peel will be new to many readers, and is excellent, whether it is true or not. It has connection with the famous picture by Holbein of Henry VIII. delivering a charter to the barbers and surgeons on the occasion of their amalgamation into one body, John Penn standing out as a prominent figure on the canvas. Lady Dorothy's reminder, prefaced by an expression of her fancy that the story rests upon no solid foundation, is that Peel always expressed the greatest admiration for this painting on account of the fine portrait of the royal barber, and once actually offered the Barbers' Corporation two thousand pounds to allow him to have it cut out after a copy had been made to put in its place; and then it is added: 'An even more fantastic legend used to declare that Sir Robert had often expressed an intense desire to be allowed to have a bed made up upon the dining-table of the Barbers' Company, in order that on awakening in the morning his eyes might rest upon his favourite Penn. The table in question, as a matter of fact, is an ancient dissecting-table, on which, previous to 1745, the bodies of criminals and malefactors were laid, the executions at Tyburn furnishing the Barber Surgeons' Company with a constant supply of anatomical specimens.'

* * *

Various possible clues to missing art treasures are suggested casually in these pages written by Lady Dorothy Nevill. Sometimes great collectors forget what they have collected, and go out in anxious search of their own possessions. We are told that the Marquis of Hertford, the same who did so much to make the Wallace collection what it now is, had this tendency strongly developed, and was in the habit of keeping some of his finest and most valuable pictures piled up in heaps against the wall, not troubling to have them hung, or indeed paying any attention to them at all. Such is the result of the mere collecting mania! Now, his lordship was in the habit of employing certain agents to buy for him; and on one occasion, it is said, sending for one of the most able of these men, he bade him spare no expense or trouble in the effort to secure a certain picture, the details of which he minutely described. The collector accordingly set out, telling his lordship that his wishes should certainly be fulfilled; but in spite of the most strenuous exertions the much-sought-for picture could not be discovered, and Lord Hertford eventually received a letter from the man saying that, much to his regret, he was abandoning the search, feeling convinced that it was useless. A year or two later this very collector, whilst travelling on the Continent, chanced to come across a shrewd dealer whom he had not yet questioned about this picture. He accordingly asked the man whether he knew anything about it, to which the latter replied, 'Know anything about it! Of course I do; but you need not trouble any further about it, for it has gone into a collection from which no money will cause it to emerge. Lord Hertford bought it of me three or four years ago, and, as you know, he never parts with anything.' The collector at once informed his patron of what he had been told, and when a search was made the picture was duly discovered propped up behind several others, with its face to the wall. We are reminded that there are still in Coutts's Bank a large number of cases deposited there by French *emigrés*, who, having returned to France in order to forward the Royalist cause, met their death without having left any instructions as to the disposal of their property lodged in England. It has also been said that a great portion of the splendid jewellery of Madame du Barry, never properly accounted for, remains intact and untouched in an unopened case in the strong-room of the bank. According to the present system of things, all such treasures and belongings of the dead have to remain there, just as they were placed, until their legal owners come for them, which in the nature of things will never happen. The rule is for the bank to allow the boxes literally to moulder to pieces, carefully wrapping up in paper any objects which may fall out, and replacing them in a heap on the top of what is left. Lady Dorothy Nevill properly remarks that it seems a pity that no Act of Parliament should ever have been passed to deal with such cases, for there are probably many priceless works of art slowly drifting to utter decay in these old brass-bound chests fast mouldering into dust. By the way, she has some odd reminiscences concerning the very moderate use of tobacco in those times. 'Smoking-rooms in country houses,' she says, 'were absolutely unknown, and such gentlemen as wished to smoke after the ladies had gone to bed used, as a matter of course, to go either to the servants' hall or to the harness-room in the stables, where at night some sort of rough preparation was generally made for their accommodation. To smoke in Hyde Park, even up to comparatively recent years, was looked upon as absolutely unpardonable, while smoking anywhere with a lady would have been classed as an almost disgraceful social crime. The first gentleman of whom I heard as having been seen smoking a cigar in the Park was the late Duke of Sutherland, and the lady who told me of it spoke as if she had been present at an earthquake!' Again, a most delightful book.

A PAWN IN THE GAME.

CHAPTER XVI.—RED SUNDAY.

IT was Sunday. But no tread of hastening feet in the streets of Paris told of gathering congregations; no harmonies of chanted psalms, no wail of lamenting litany, rose in the churches. It was to be a devil's Sabbath, a day of evil memory for all time. It was September 2, the blackest day in the calendar of the Revolution — an almanac so full of mingled light and darkness.

Jean wandered restlessly through the streets that day, conscious of a strange disquiet lying upon him which he could not explain. He had so far failed completely in the business which brought him to Paris. A dim feeling that events were moving swiftly to some dreadful crisis possessed him, yet the sense of helplessness lay upon him like a paralysis.

Early in the morning he betook himself to the Hôtel de Ville, hoping to meet Toulan; but the great building wore a darkly silent aspect. The committee sat with shut doors. There were no deputations, no crowds of garrulous spectators. Jean caught a glimpse of Marat's crooked legs climbing the steps to the great door, which opened to receive him and was shut again instantly; and the sight of his broad, evil face, with its projecting chin, its blotched cheeks, and its dishevelled hair, disquieted him. The fierce yellow eyes beneath the slanting eyebrows had a fixed and preoccupied stare. It was as though they were held by some dark picture drawn on the very air.

Little groups came up to the door from time to time and were admitted; but they were strangers to Jean, and quite unlike the ordinary spectators. They represented a new and evil type. In face and dress they recalled to Jean the half-savage inhabitants of the cellars along the banks of the Seine—a race as dangerous and fierce as the wild beasts of an African forest. What dark errand brought them to the Hôtel de Ville? Was some secret and bloody plot on foot, and were they its instruments?

Jean hurried to the Abbaye; but there, again, the great gates were jealously shut and silent. At noon the sullen boom of a gun sent a wave of sound across the streets of Paris. It was an alarm-gun; but of what it was the signal Jean could not guess. Presently, as if in answer, there rose in the air, and from every point of the compass in turn, the sound of the tocsin shaking the atmosphere with its harsh call. Still the city seemed motionless. The streets were empty. Jean felt as if some nightmare lay upon them.

Late in the afternoon he betook himself again to the Abbaye. As he came near it he was disquieted to find all the approaches blocked by a silent and staring multitude. A French crowd usually wraps itself in noise as in a garment, but this was strangely hushed. All faces were turned towards the gate of the great prison; many were white and rigid as if with horror. Each man seemed to be unconscious of his neighbour's presence. They were spectators of some dreadful scene which held them spell-bound.

Jean forced his way through the crowd, and at the spectacle before him its mood of silent horror fell upon him. The whole space in front of the Abbaye gate was strewn with dead bodies lying in a hundred attitudes of flight and terror, as if death had come upon them suddenly and in some pursuing and dreadful shape. The dead, as their dress showed, were chiefly priests. At the entrance of the prison was an armed guard in civilian dress and red caps. The gates themselves were open, so that the great court within could be seen. In it was a crowd of some two hundred men, with pikes and swords, grouped in a ragged curve in front of the main door opening from the building. Jean saw, with a shudder, that the pikes above the red caps were crimson with blood. What explained that red stain on so many steel points?

As he stared with uncomprehending eyes the door opened, a hoarse voice cried, '*À la Force!*' and a struggling figure was thrust out. The red pikes fell to the level of a charge, the guard in the court closed fiercely to the centre, there was a forest of brandished and thrusting arms; a wild, broken, long-drawn shriek rent the shuddering air, while a wave of emotion swept through the watching crowd around Jean. Then he suddenly understood. The darker forces of the Revolution had thrust aside the existing tribunals, and were setting up a fierce, swift, unpitying judgment-bench of their own. They were 'purging the prisons.' It all grew intelligible to Jean as, with blood half-frozen with horror, he stared at the dreadful sight. All the passions of the Revolution were here brought to an evil climax.

Always the forces in it making for violence had conquered the forces resisting violence. The Tiers État had captured the States-General; the Girondists had been overthrown by the Mountain; the Jacobins outraved the Cordeliers and crushed them; and now the Commune had thrust aside the municipality, the National Assembly was in the fierce clutch of the Convention.

All the conditions of the moment were on the side of the extremists. The terror on the frontier reacted on the terror at the heart of France and made it pitiless. It was true that Danton was Minister of Justice—a sufficiently grim and ruthless guardian of the law, it might have been supposed; but even under Danton 'justice' was too slow for terror-shaken Paris. The blade of the guillotine

was not plied fast enough. What Jean looked at was the work of a rude, fierce, half-lunatic tribunal called into existence by the group round Marat and reflecting their madness. Paris was obeying the law of all revolutions.

Jean stood long, looking with white face and troubled eyes at the bodies of the dead, at the gate with its fierce guards, at the wild scene beyond. The crisis he feared had come suddenly and in a shape more terrific than anything he had imagined. The fate of Denise — he hardly thought of her mother — would be determined within the next hour. She might be submerged beneath this wave of murder, and he was helpless.

Presently he turned, forced his way through the crowd, and ran at speed along the empty streets. He passed long lines of houses with shut doors and drawn blinds, as though those within knew that a tragedy was on foot and refused to look on it.

Jean must find Toulan. He alone could open a way through the gates of the Abbaye, where murder and terror kept watch. But even while Jean ran his feet seemed heavy as lead. What might not happen in that dark prison before he returned? Just as, breathless with haste, he reached Toulan's house, the door opened and Toulan himself came out. He had on his official scarf; a strange gravity lay on his usually reckless features.

Jean, in hurried accents, began to explain what was happening, but with a gesture Toulan stopped him; he seemed to know, and Jean felt, as he realised this, a chill run through his blood. The crime on foot was no casual thing; it had been deliberately planned. It even had official sanction. Was Toulan a party to it?

But he was quickly reassured.

'Come,' said the Frenchman, 'we must save *la petite;*' and he began to walk swiftly in the direction of the Abbaye.

It was no time for words, and without another syllable both hurried on their errand. They reached the crowd, which still stood in the same fixed and horrified silence opposite the gates of the prison, and in a masterful fashion Toulan broke his way through it. He was recognised by the guard, and, closely followed by Jean, passed into the court. His official scarf — and his abrupt, commanding speech almost more than his scarf — won them entrance. It was growing dark by this time, but a dozen flaring torches lit up the court with an uncertain light. The massacre, disguised in the forms of law, was in full process. The heap of bodies on the reddened pavement was higher than when Jean saw it before.

Just as they entered the court the prison-door was opened, and the cry, '*À la Force!*'—the death-sentence—was heard again. The doomed figure this time was that of a Swiss—an officer in a blue coat with epaulettes. A torch was thrust so near his face as almost to scorch it, and in the light the features were for a moment vividly seen. Jean never forgot that face — the bristling moustache, the retracted lips that showed the white teeth, the narrowed eyes that fluttered to and fro like those of an animal. The face was that of a brave man, but of a brave man looking suddenly on death, and on death wearing a mask of murder. A score of darting steel points smote him; with a gesture of up-flung arms the Swiss took the thrusts, a few staggering steps, and he fell.

Jean would have stopped, held with horror at the sight, but Toulan caught him by the arm and pulled him to a side-door, by which they entered. 'We have no time to waste,' he whispered.

They stumbled along a dark passage, and reached the hall where the self-appointed tribunal sat. Some dozen men were round a table, on which were papers, a couple of inkstands, half-a-dozen pipes, and as many bottles. Some of the judges had jackets and aprons on; some were standing, some sitting; all wore red caps. Behind, half-hidden in the gloom, were sleeping figures lying on the benches.

The president of this strange tribunal—an extraordinarily tall man in a gray coat, with a sabre by his side—was half-sitting on the table. He nodded carelessly to Toulan, who addressed him as 'Citizen Maillard.' A man at either end of the great table held a torch in his hand. At the door opposite the table stood a turnkey with his hand on the bolts; two others, in shirt-sleeves stained with blood, guarded the great door opening on the court with drawn sabres.

A prisoner had just been brought in, a guard holding each arm and one behind grasping the collar of his coat.

'Your name; your profession,' said the president sternly. 'The least falsehood will destroy you.'

Then he took up a sheet on which was written the name of each prisoner and the charge against him, and listened while, with a catch in his breath at almost every syllable, the poor wretch before him tried to answer his questions.

Messengers came and went while the trial was going on. Some of the judges left the table, chatted with the onlookers, and then came back again. The trial was stopped more than once to settle some foreign matter in debate. Presently the judge impatiently plucked off his cap.

'Citizens, we have heard enough. What is your sentence?'

'*À la Force!*' shouted one of the judges.

The rest were silent; the president nodded; the guards holding the unfortunate prisoner hurried him to the door, and Jean heard the fatal words shouted hoarsely to the crowd of executioners outside. So the terrific drama went on. Here was justice reduced to its elements.

(To be continued.)

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART X.

MANY of the letters which I have already published refer to my mother's stay in the south of France in 1866 and 1867. She had gone to Biarritz in the late summer of the former year, accompanied by my father. Later on he had established her in Pau, and had then returned home. The following letters from her to my father describe an excursion which she made in February 1867 to Biarritz and St Jean de Luz. Her companion was her maid, Martha Jones, a gaunt, big-boned spinster with a shambling gait and a face severely marked with smallpox. The Chorley who is referred to was H. F. Chorley, the musical critic of the *Athenæum*, whose journalistic campaign against Madame Schumann and the music of her husband had created a certain amount of sensation. I shall have more to say about him in a later part of this series.

'BIARRITZ, *Wednesday Evening, 13th February.*

'Here I am safe and sound and miles and miles better, if you know what that is. I came here on Monday in time for dinner, of which I partook in company with some depressed compatriots and one gaunt elderly French couple. Not a word uttered. I couldn't stand the depressed compatriots, so at yesterday's dinner I took my place beside the French couple, and boldly plunged into a conversation, to their great surprise, in their own tongue, which was listened to with a melancholy respect by the D. C.'s. Gaunt French couple were delighted to find at last a sort of tame and acclimatised animal in the great British travelling menagerie of wild ones. Yesterday was a glorious day—blue, crisp, sparkling, the sea thundering up in its own particular grand Biarritz way on the lovely golden sands. I was out sniffing, imbibing, revelling all day nearly. The depressed ones do not go on the shore. I see them wandering listlessly up and down the deserted *magasin-fermé* street, though, with Murrays and silk umbrellas. I had the shore all, *literally* all to myself, and I felt my heart swell, as I went along, with the sort of bounding elasticity one feels on again returning to the great, glorious, life-giving, life-taking monster. I am a new being already. I feel I have had no air in Pau. What is the use of having one's lungs mended and fitted for the proper reception and circulation of God's air if there is none to circulate? Oh, how I breathe in this healthy, strong, capital sea-breeze and bless Heaven for it! I have got so enterprising, and am driving into nooks and corners of Biarritz I never penetrated before. It is a *glorious* place at this season. I do it full justice now. Although we stayed such a short time at the hotel here, the servants welcomed me like an old friend, and shook hands with the chastest of her sex (Martha). They have given me a dear, sweet little room on the *rez de chaussé* as you enter at the front, with a window looking over the sea towards, of course, the Villa Eugénie. This and Martha's modest chamber cost six francs a day. I have breakfast *dans ma chambre* and dinner at the table-d'hôte, which is now in the Maison Rouge, the Hôtel de France being shut up in winter. I am able to eat once more, *and to sleep*, which is a faculty that had singularly decayed in Pau. As I have Martha for my sole companion (not companion of my soul, though) here, I am at present engaged in trying to elevate her mind by instilling little historical and scientific facts (all as nearly in one syllable as possible, not to alarm her unnecessarily), but she is disappointing—very disappointing. She has one answer, and one alone, to everything I tell her. She brings it out alike when I mildly try to prepare her for the beautiful annular eclipse there will be next month, or when I simply call upon her to observe that the nearer we approach Spain or Italy the flatter become the roofs. "Oh my, good gracious me, yes, 'm." To-day I hired a *petite voiture* for a drive to St Jean de Luz, and to give her a little pleasure I took her with me. I instilled a little on the road at first, but the idiotic "Oh my's" reduced me to silence at last. I felt they were intended at once as an admission of her own ignorance and an implied complimentary surprise at my astonishing amount of information. One thing was delicious, and I take great credit to myself for not exploding on the spot. I saw her gazing reflectively at the side of the road several times. At last she awoke me from dreams of past and future to present by saying timidly, "If you please, 'm, is this the road to Canton, and is it far, 'm?" "Not the direct road, Martha," I said with a perfect and highly-bred gravity upon which I congratulate myself, "and I'm afraid it's rather far." "I think, 'm, it can't be so very far off, as I see it on the mileposts all along the road, 'm." Oh, Doochen, you see it, don't you? I didn't even smile as I explained what this deceptive and misleading post meant, and I am proud of my manners. I enjoyed my drive and little excursion to St Jean de Luz immensely. I fell in love again with the quiet, quaint, deserted old place. I looked over great barracks, *maisons à louer*, for the fun of the thing; went through Moorish-looking courts and halls, and up staircases with old carved wood balustrades, up which Noah's immediate relatives must have walked when the Ark anchored at St Jean de Luz, as I am positively prepared to assert it did. One lodging struck me from the outside.

Above a pottery-shop, where an old, gray-headed, spotlessly-linened man was sitting with his cat beside him (both lineal descendants from the patriarch just mentioned, and the pair of cats he had on board at the time), I saw two open windows with snowy-white curtains waving in the breeze. "Martha, I want to live there. Let's go in directly and see about it." The polite old man took us up into the cleanest of rooms, with a large alcove with a bed in it. "Martha, I see myself at that window with my worsted work on that table—don't you?" "Oh my, good gracious me, yes, 'm." At the other end of the clean little passage was the cleanest, the most old-fashioned kitchen in the world; a large, old-fashioned casement-window, deep in, with a seat looking on to a little garden; an alcove with a bed at one side. "Martha, do you see yourself under that flowered coverlet?" "Oh my, &c., me, 'm, I think I do." I very nearly settled with the old man on the spot, but I didn't, and just took his name in writing. It was the most deliciously antique-looking place, just after my heart, with a squint of the sea if taken with the left eye, and not a soul to be seen in the street. Martha says she would cook for me and for herself, and she thinks "it do look so like you, mum," and she likes it immensely herself. And there's a market twice a week and fresh air at a moderate expense, and I'll make up my mind and let you know. In the meantime, good-night, dear love.—Your own N. L.'

'BIARRITZ, *Friday, 15th February.*

'I told you how I entered into conversation with the French couple at the table-d'hôte here. Yesterday I thought I would try a terribly silent, oppressed-looking compatriot who sat next to me—a pink man with a bald head and spectacles, and beard in the first stage of sprouting bristle. So I said in my sweetest voice, "Isn't the sea magnificent at Biarritz, sir?" I was startled by the surly abruptness of the answer, "Nothing to Cornwall. Ever been in Cornwall?" "No, never," said I timidly. "Thought not. You'd think nothing of this if you had. *I'm* a Cornish man." "Oh, of course," I said, and not another word passed. *Of course* he didn't bow when I rose from table. Rude brutes these middle-class British are. On the other hand, I get on charmingly with my French friends. However, to-day is my last dinner in this bear-garden, and to-morrow hey for St Jean and solitude. I hug the idea of my ark to my heart. I like the notion of living, moving, and having my being in the midst of Noah's relations. A fortnight with the Old Testament! What a novel thing! I'll write you at once from there, and describe it all to you.'

'29 RUE NEUVE, ST JEAN DE LUZ,
Saturday Evening.

'Well, dearest, here we are, Martha and I. In *such* an ark. Oh, if you could see us! If you could see my old spotless landlord, who lives alone here with his servant. His servant, did I say? She is no other than Noah's grandmother, whom he must have left behind when he sailed from this port. She is much too old, much too withered, much too bony, much too brown, much, much too tough *ever* to die. Consequence is that, of course, she never has died, and is here still in the—well, no, I can't say in the flesh, for she has none, but in the bone. It is impossible to convey to you any idea at all of this old, old wifie, and the old, old mannie, and the queer, queer kitchen, where just now I went inside the great chimney, and looking up it, saw *a star* quivering in the sky! I take my meals in that chimney, Martha cooking them before my eyes. I am revelling in bacon, sausages, eggs, and tea—purchases I made myself, getting a dozen splendid eggs, a pound of "lovely bacon as ever I saw, 'm," half-a-dozen enormous oranges, and a great thick sausage for two francs and a half. I do all my writing and embroidery in the salon at one end of the passage, all my eating and my knitting in the kitchen at the other. Out of the salon—no, in the salon is a large alcove with my bed in it. In the kitchen are two alcoves—one that of the chaste Martha, the other to be slept in by the revered ancestress of our first authenticated mariner. To complete the queerness, this ancient person is a Castilian, and can't speak French, but understands a little Italian, and I positively have to stutter away to her in a mixture of Italian and broken French, with a dash of Béarnais, which I am in hopes she takes for Basque, a language she is at home in. It is all too funny, and I am in a dream. It's like Washington Irving's hero reversed—I have fallen asleep and awoke, not years, but centuries *back!*

'*Monday Morning.*—You see I have missed a day. I wasn't in a writing mood yesterday, that's the fact. I took too long a walk for that, but it did me good in other ways, and I slept like a top. I have "taken up" St Jean de Luz, and mean to swear by it for the future, and pity people who haven't seen it, as Chorley did about Palermo. The situation is much more beautiful and picturesque than Biarritz, being so near these mountains, which seem to protect the poor old place. The bay itself is lovely, finished off at one point by a ruin on the cliff, and at the other, which darts far out into the sea, by the round fort of Socoa. Wherever you go the grand peak of Haya goes—before you, beside you, behind you. You never lose sight of its triple-crowned head. Yesterday Martha and I walked to this fort along the shore—a goodish walk. In fact, I was out for four hours. It is impossible to converse with Martha, she is so soon surprised (always out of compliment to me, as it were), and she asks such idiotic questions. How can a woman exist on so little brain? I believe she is of the frog species, and would live quite as well without her head as with it. There's not an English soul in the place but ourselves, and we are the first of that great nation that the old man has ever had in his house.

This perhaps accounts for the fact that, the first day I was here, he came softly up the stairs in his white canvas shoes every quarter of an hour or so to gaze at me—never speaking—and when I looked round inquiringly he only said, "*Bon zour, Madame; ce n'est rieng*," and went down again. The old wife did the same to Martha in the kitchen, only she wasn't silent, but poured out a volley of mixed Basque and Castilian, which Martha declares she understood; but, of course, to the frog-brain one language is the same as another. Whenever I stopped yesterday on my way, to ask the peasants where I was, &c., they only shook their brown heads and showed their white teeth (if they were young, otherwise they had none to show). Not a word of French can they speak. One girl, very well dressed, though, and evidently the higher class of peasant, said, "*Ah, non comprend français*," for all the world just the answer Martha would have given. Martha insists upon it they all understand English. She says it in a mysterious way, as if they had some diabolical motive in concealing the fact.'

'St Jean de Luz, *Friday*.

'I went to Spain to-day. I hired a sarcophagus and was driven there, namely, to Irun, in company with Martha. I seized the opportunity of enlarging her mind "by travel;" but to everything that was grand, she said it was lovely; and what I found majestic and stern she thought 'eavenly. I solaced myself by saying at times, "Idiotic," of course not aloud, and could still, to her, bear aloft a smiling countenance.

'I liked Irun, the queer, high-climbing, narrow street, where I priced in my sweetest Italian-Spanish a baby's cloak (so like me, eh?), and sighed because I had no baby to put it on!

'Up the street we walked into the country, where we diverged to have a more extensive view of the dear mountains. The lane would have been yellow with primroses, had it not been purple with violets and scarlet with berries! I gathered what Miss Jones called "an 'eavenly bookie," which I bore home with me. We walked about for two hours. To the left, Fuentarabia sat quaintly on a peak that went sharp into the sea. I got an old man with a big bunch of keys to let us into the old church, and he drew all the curtains aside from the altars, and showed us the horrid distorted figures of the Madonna and Jesus, and doves, and hearts with things through them, for the modest sum of fivepence. Everybody stared at us. Every balcony had a face—two faces—many faces—staring kindly at the strangers—the mistress with her dress short, the maid with hers trailing in the dust. We left St Jean de Luz at twelve, and were home about five. I had heard from a shop-woman that she had two English ladies lodging with her, and so, after I read my papers, I handed them in for these ladies, thinking they would be *très contentes* to see the *journaux anglais*. So as I came back there was Mrs L'Estrange, the English lady, come to thank me and we had a long chat. She is here for the winter. One other English family is here also. She loves the place as I do, and can't think why it has never been found out as a winter residence! . . . At Irun we saw all the women come from the sea with baskets of fresh anchovies on their heads, of which fact they were good enough to inform us in that fearfully shrill cry you know of as connected with "*sardines fraiches*" at Biarritz. I bought a great lot of them, almost leaping with life, and brought them home, and M. and I have just had them for supper, done like whitebait, and excellent.'

'St Jean de Luz, *Monday*.

'It was very good of you and R. to find so much to be amused at in my letter to her, but I can't remember having said anything especially funny. The awful difficulty to me is to write different things to all my friends, and I don't always succeed. I have about a dozen to twenty letters to write, all in pretty much the same set. It harrows my very soul to think of it sometimes. I wish people would consider one letter from me an equivalent for three from them; but you can't get people to do that. I have written again to Tuck, with the purpose of prevailing on her to bring the Chief [Justice] to her feet by singing at his house the day after to-morrow. She can't refuse, as I have asked her to do it *for my sake*. And even if she is nervous, she must be encouraged into going on till she grows inspired. Good Lord! when I remember one day Mrs —— shouting and howling at Miss Gabriel's like a whole family in the middle of a street, the father with one leg and the baby in his arms, the mother with the other three clinging to her petticoats, and *all singing*—when I remember this scene, and poor Mrs —— growing crimson, scarlet, and magenta in the face with the exertion, and people thinking they thought it "grand," and when I compare our Tuck!!!

. . . . . .

'My dear, you should see the touching passion the poor old Spanish woman, the hard-worked servant sixty years of age, has taken for me. It is funny, and quite affects me. She flies to do what I want—is never happy but when she is doing something for me—is so careful to have my fire good when I come home after walking, and is so grateful if I am pleased with what she does. I don't understand above two words an hour of what she pours out to me in her affection. *Buenos—hermosa*—such words I catch as a drowning man does a straw, and then I say "*Si, si*," and she is quite satisfied. At the market I bought her two dreadful coloured prints in frames for a franc each, on the Virginian System as to subject, of course, and I think if I had given her an entire outfit of clothes or an annuity payable quarterly, she wouldn't have been so grateful as for these wretched daubs. To be sure, I bought them on purpose for her, and carried them home myself (like Mama, eh?), and presented them. Yester-

day being Sunday, and the news of these wonderful acquisitions to poor old Maria's little picture-gallery having got abroad, the house was crowded with her friends, who had come to see them, and *me* if possible! She never saw an Englishwoman to her knowledge before, certainly never spoke to one. She has been twenty-two years with the old man. I gave her five francs this morning, for she has done so much for me and Martha, but she was almost indignant. However, I said she must buy something with it to wear for my sake, which soothed her. She has just knocked at my door and entered to show me a beautiful *mouchoir* for the head and a pair of black cotton gloves that she has bought for the money. She went to the funeral of a Spanish friend of eighty-five the other day, and everything she had on was forty years old: the black dress, the black woollen mantilla she wore on her head—all, all had been worn by the poor soul before I was born, and were her *best yet*. How refreshing it is to find still such innocent, unspoilt peasant natures! She told Martha she prayed for me night and day, and would do so all her life.'

'*Still* St Jean, *Wednesday Evening.*

'I'm disappointed at getting no letter from you for two days. Perhaps I shall not get any more from you directed here. Well, that will be made up to me when I return to my sheepfold, which I do *really* on Saturday. We thought it a pity not to stay the two weeks out, and the sea smelt so delicious, and looked so glorious after I had arranged to leave it, that I couldn't resist it and gave way. I never saw such waves as there are here. They come rolling in slowly and majestically, and when near the beach grow an immense height; then they curl over, and you seem to look into a great, deep, clear, green cavern, when over they go, tumbling in a magnificent mass of white spray. Oh, how I long to have you here sometimes; how you would enjoy it!—but most of all you would enjoy the downs, away at the end of the beach, high up on the rocks that suddenly pile themselves up. Oh, what a walk that is!—miles and miles—all along the cliff—undulating, beautiful downs covered with primroses and (scentless) violets, looking so simple and innocent, as if they were not a bit afraid of the monster that was roaring and dashing amongst the rocks below, and whose spray positively wets them at times, I dare say. When I go there I never see a soul but myself, and I go wandering along till I find some smooth, secluded spot with a rock or two to shelter and seat me, and there I sit with a book for pretence, but my thoughts and dreams for reality—and they go far, far away northwards, and I forget where I am. Sometimes I take my knitting with me (such a pretty sock for you), and, ah me! thoughts of the future wearer of that sock are knit into every stitch I do, with a stitch here and there for the children, and sometimes a whole row for Woodlands. There is a whole history of future love and hope, and all the sunshine of *home* knitted into these socks; so wear them advisedly! I had a letter to-day from Chorley. I enclose it for your strictly private inspection; then burn it. Poor fellow! you must only smile at his morbid vanity, and not be angry at it. I have answered it, and will quote bits to you that are answers to some of his statements. Of Madame Schumann, and of her admirers dropping him, I say I don't believe for a minute that people who like Madame S. would give him up or like him less—why should they? There is myself—"to me there is something grand in that woman, something grand in her playing," but that would not influence my opinion of him. Then I say I rather think Amelia is hurt with him for never calling since she came to town. She has never said so to me, but I imagine it. As to Mrs ——, I say, "Oh dear, how ill it would make me to have Mrs —— singing to me through an open door! I wouldn't even like it through a shut one."

. . . . . .

'I am sorry poor Chorley demeans himself to so much unmanly spite sometimes; but such is my pity for him, and my old-standing feeling of affection and tolerance, that I never for a moment bear him a grudge; and for my sake be good, be lenient, to the lonely, much-forsaken, affection-seeking (and so seldom-finding) old man. Think, he is going on for sixty now, and only by his dinners can he gain or hold for an instant the least regard. To me all his vanity is most pathetic. So, for my sake, I say it again, be good to him, and pay him some little attention, which will make him think you care a bit for him. Will you?'

'St Jean de Luz, *28th February.*
(Oh, I wonder is it leap year?)

'I should have been heart-broken if I had not heard from you to-day, because after to-day all my letters go to Pau, I think—*Pave*, as my old Spanish woman calls it, where "Los Niños" are. I positively begin to understand a bit of Spanish, for I found out very soon that *Castilianos* means the Spanish language, not that the person comes from Castile. Well, to-morrow is my last day in this charming solitude. Dear me! if I were an old-fashioned German lady, I should be writing such wonderful sentiments spun out of my inner consciousness assisted by my outer surroundings. I might then have become classic, like Zimmermann & Co. The fact is, I have had a try at an article, as I think the place ought to be known as a winter residence, but the letters I have to write and do write take it all out of me. I wager George Eliot and all those great writers don't write letters to their fifty friends as I do. My brain and my will and my patience get exhausted, and I can no more. I am a mute, inglorious authoress. Amen!

. . . . . .

'It has been pouring steadily since two o'clock. I shall pay my farewell visit to Mrs L'Estrange to-morrow. She will miss me, as she does love to talk about mineralogy and geology in a tottery sort

of way. She never ceases when she once begins, and is one of those old women who call a walk "a ramble" and a little boy "an urchin." I allowed Martha to sit in my room and read last night while I wrote, and I made the discovery that she is one of those people a century behind their time, who blow their leaves open instead of turning them over. She blew for half-an-hour at one page, and sat on the edge of her chair the whole time, and didn't like having the candle too near her—it looked too familiar. You know the species. I am getting morbid in noticing the small peculiarities of race and character. Adieu.—Your own N.

'*P.S.*—She also held her book a good distance from her; it looked more respectful.'

CUSTOM-HOUSE RED TAPE.

There's never a flood goes shoreward now
But lifts a keel we have manned,
There's never an ebb goes seaward now
But leaves our dead on the sand.

KIPLING.

BRITISH ships sail on every sea, and all the earth is under tribute for their lading. It stirs the heart to stroll round some great dock and see the contents of ships' holds piled in rich profusion; but to those behind the scenes there is little of romance or sentiment in these evidences of activity on the part of tramp steamers and ocean liners. They see only the prosaic side of a romantic subject. The shipping trade of Great Britain is one of the wonders of the world—rather more than half the tonnage afloat is British owned—and the subsidiary businesses it directly nourishes are too numerous to mention. They all mean employment, skilled and unskilled, and in their different ways bring grist to the national mill.

Not the least interesting branch of work connected with the matter of oversea carriage is the attending to Customs formalities. The authorities are extremely punctilious in exacting full compliance with the regulations, and those whose duty it is to carry out all the conditions have no easy task. To the general public this everyday process is probably a sealed book, and the following brief outline may serve to remedy that defect, showing how goods from foreign parts run the gauntlet of His Majesty's Customs.

The procedure in dealing with a cargo from abroad may best be explained by taking as an example the arrival of a weekly trader from the Continent in some British port. Notice is given the day before the vessel is due (or as soon as her departure from the other side is notified by telegraph) as to the hour when the ship is expected to enter the river or harbour; also, at what time it is desired to begin discharging cargo. Should the hour be fixed earlier or later than the regulation day for Customs outdoor officers, the *shipowner pays* overtime charges. The clerical work begins as a rule at the same moment as the breaking out of cargo. A full list of the vessel's load is prepared—called a report—signed by the captain, and handed to the Customs officer in charge. Usually this is written out abroad, on proper forms provided for the purpose, so that there is no delay on the ship's arrival, as would be the case had it to be made out after her coming into dock. A copy of this report is also sent for the shipping clerk's guidance, whose work it is to furnish all documents necessary to satisfy Customs requirements. From this copy and from the details contained in other of the ship's papers—bills of lading and manifest—there must as speedily as possible be made out entries which give marks, quantities, descriptions, and values. This is in duplicate for 'free' goods—that is to say, there are two papers, one being called long, the other short. The former mentions the number of packages in words, the latter in figures. When it is remembered that a general cargo from Germany, Belgium, France, or Holland consists of scores of different kinds of produce and articles of manufacture, the labour involved in getting ready the *entry*, and that without loss of time, will be understood. Perishables such as fruit, vegetables, and yeast, being on deck or near to hatchways, come ashore first, and an *entry* for all such produce is made out separately, so that the Customs may get on with their examination. Nothing can leave the quay or shed until the Customs give sanction. The officers have thus enough to do for a time, long enough to allow the other portion of the cargo to be entered.

If the routine of dealing with 'free' goods is tedious, the formalities attending 'duty' goods are still more so. To begin with, such articles as tea, coffee, cocoa, wines, spirits, beer, tobacco, and cigars must be entered on special forms varying in character; and not only do the papers for the different articles vary, but they assume manifold changes dependent on what it is proposed to do with the merchandise. It may be entered for duty, warehouse (Customs or Excise), transit under bond to another town, or simply by *bill of sight*. This last alternative is always resorted to when no instructions are to hand to indicate the wishes of the importer. It simplifies matters often when in doubt, too, as to whether a certain package is liable to duty or not, to enter by *bill of sight*, because it can be adapted—or 'perfected,' as the term is—at a later period. A temporary lock-up bond is usually provided near a discharging-berth for the safe keeping of dutiable goods pending examination, the

keys being kept by the Customs. The limit of three days' grace is allowed, when, if no action has been taken, the Customs insist on the goods being sent to a proper Customs warehouse or in some manner disposed of.

The *Official Handbook and Import List* contains the law as to the Customs; and it is a book which puts *Bradshaw* to shame for complexity. Probably no person could master it and equip himself for tackling the multifarious problems connected with foreign traffic. What actually happens is that junior clerks learn from seniors by dint of copying the various documents what the procedure is and what official terms must be used. For a description must be given of each kind of import, in the language laid down in the official book. There are exceptions to this demand, for in some instances no description is required, and it is these exceptions to rules that prove so confusing. Amendments to the tariff are frequently issued—there is no finality to the orders of the Board of Customs. No sooner has a clerk got accustomed to describing an article in certain phraseology than all description is abolished or an entirely new one enacted. For instance, apples and pears used to be entered as 'fruit raw unenumerated;' but this was altered as to pears, it being sufficient to say 'fruit raw.' Amongst absurdities of this nature may be mentioned the following: 'oysters, fish fresh not of British taking.' As if it were possible for, say, Dutch natives to be guilty of English origin. Then another specimen of official definition, and a truly Gilbertian one, refers to sewing-machines, which it is gravely laid down must be entered as 'machinery, other descriptions, not steam-engines'! Whenever it seems impossible to tack on a more prolix description for some article the formula goods 'unmanufactured unenumerated' is given. As to the regulations for describing dutiable goods, their number is legion and unintelligible to all except experts. Before wines or spirits can be moved there is a great to-do: gauging, sampling, and testing till further orders. An anomaly not easily explained lies in the rule requiring a document called a *permit* to be fastened to cases or casks of spirits, but not to similar vessels containing wines. It can only be dubbed 'red tape,' probably a survival of some old condition the origin of which has been forgotten.

Although grain is now admitted free of duty to these shores, the Customs insist on all such produce being entered on separate forms. The term 'grain' covers a long list of things like corn, peas, beans (not fresh), rice, barley, oats, and rye. The imposition of a tax on grain a few years ago (since removed) caused no end of trouble and loss by reason of increased charges and delay apart from the incidence of the impost itself. It was surprising what a host of people got their eyes opened to the full meaning of a new tax (or at least a revived one) when it was applied to such a commodity as grain. And the same may be said of the present tax on sugar. The scent for sweetstuffs is very strongly developed in the Customs officer, and he has found sugar in such an unlikely article as blacking, to the surprise of innocent importers, mulcting them in payment of duty on the sugar found on analysis to be contained in the blacking.

Entry forms have not only to give a proper description of the goods imported, but must also state weight, quantity, measure, or number, according as the tariff lays down. Some of the rules in this regard are not a little curious. Eggs, boots, shoes, and cucumbers have to be numbered; onions and fruit of all kinds are declared in bushels; grain is expressed in hundredweights; wines, spirits, and vinegar in gallons; manufactured iron, steel, and such-like heavy articles have their weight declared in tons; cigars, tobacco, and beads in pounds; casks of beer are gauged, and the measure expressed in barrels, firkins, and kilderkins.

With regard to 'entering' outwards, there is nothing in this like the trouble in the already described process inwards. The exporter must, under penalty, hand to the Customs within six days of the ship's clearance a specification of the goods exported by him, giving quantity, final destination, and value. This information is required for Board of Trade statistical purposes, and much of the data demanded in regard to imports is for the same Governmental department.

It is from these returns that the trade pulse of the nation is felt. The periodical issue of the value and bulk of the country's imports and exports is compiled from the entries and specifications sent in from all the ports of the kingdom. The mention of the word value recalls an impression held by those who are in a position to know—namely, that the figures given for exports are much more accurate than those for imports. In the one case the exporter knows from his own books the price obtained for his exports. In the other case the declaration of value is frequently an estimate made by the shipping company's clerk. The authorities in London sometimes query values, and have notions of their own on the subject which they think nearer the truth than the opinion of the man on the spot. For instance, because strawberries may be entered at Goole as worth eight shillings a bushel, they think the fruit should be of the same value at Leith. But local circumstances affect prices, and to fix values arbitrarily can only be the result of red tape again.

A more lengthy account of the methods of the Customs could be given, but enough has been said to convey an idea of the routine demanded by the present system. The Civil servants engaged in Customs work are as a rule obliging, and try to make the drawback of governmental interference as little irksome as possible. Some of the surveyors interpret the regulations in a very narrow, strict way, and cause the maximum of trouble; but, generally speaking, the outdoor staff do their best to minimise the faults attending a cast-iron system. There is room for reform, especially of documentary amplifi-

cations and the regulations as to inspection at place of discharge; and the abolition of burdens such as overtime charges and paltry fines is a crying necessity. The work of the Customs should be as smoothly done as is the handling of traffic on a great railway. In short, the service should exist for the country, not the country for the service, as the swaddled-in-tape system of to-day would suggest. A diminution of officialism and an access of up-to-date business method would be a welcome innovation, and make less rigorous the running of the Customs gauntlet. At present the Custom-House, in common with the Post-Office, the War Office, and to a lesser extent the Admiralty, must be charged with a partiality for red tape. It would seem that from such thraldom no department of the State can claim exemption. Owing to outside pressure there has in some of the services taken place a curtailment of this 'thin red line.' To all whom it may concern, it is to be hoped that some day reform may extend to that great but little understood institution known as His Majesty's Customs.

THE MONTH: SCIENCE AND ARTS.

TRACING THE LOST UMBRELLA.

PROBABLY there is no more elusive article than the umbrella, the loss of which at some time or another every reader has no doubt experienced. The most common form of loss is inadvertently to leave it in a vehicle, a shop, and so forth; and it is estimated that some three hundred thousand umbrellas are lost annually in the United Kingdom. An ingenious and useful invention, however, has recently been devised which will practically render such misplacement an absolute impossibility; while at the same time, when it is found, no confusion or difficulty on the part of the owner in identifying his property will arise. The device consists of a small and neat tablet let into the handle of the article, bearing the owner's name and address, and hidden from view by a slide. The boon will be especially appreciated by the clerks in the lost luggage departments of our railways and the officials of the police departments, since upon an umbrella being found it will be possible for the owner to be communicated with at once. While, of course, the contrivance will not be proof against dishonest practices, it should serve to diminish the heavy loss, which in the aggregate must represent hundreds of pounds every year, arising from forgotten or misplaced umbrellas.

PENNY-IN-THE-SLOT MILK-SUPPLY.

A step in the right direction towards ensuring a pure and uncontaminated milk-supply, direct from the cow to the consumer, has recently been effected by the evolution of an automatic delivery machine upon the penny-in-the-slot principle, some of which are already in use in London and other large centres. The apparatus is small and compact, occupying but little space, and perfectly simple both in design and operation. It, moreover, reduces the labour of the dairyman at the retail shop, and, in fact, enables him to close his premises without any apprehensions concerning loss of trade by so doing, especially on Sundays. The machine is adaptable of attachment to the door of the shop. There is a large reservoir containing some twenty quarts of the liquid, which falls into a lower receptacle, the delivery into the customer's jug being controlled by the admission of the coin. Upon the outside of the shop-door is a small handle similar to that of a beer-engine, with a spout beneath, together with a slot for the coin. The milk is sold in pennyworths, which practically buys half-a-pint of milk, so that the customer pays no more for the beverage than if he bought it over the counter in the usual manner. All that it is necessary to do is to insert the penny, pull over the handle, and the requisite quantity of milk is discharged into the jug. If the customer requires a pint or quart, he simply inserts successively the number of pennies equivalent to the number of half-pints contained in the quantity he desires. To ensure the milk throughout the reservoir containing its full percentage of cream as received from the farmer, a clockwork-driven stirrer is provided, by means of which the milk is agitated, though not sufficiently to churn it into butter; while in order to preserve the milk cool and fresh in summer a refrigerator is attached. These machines have proved highly successful both from a financial and supply point of view, since the customer can fulfil his requirements at any time of the day or night without troubling the dairyman. The machine is so constructed that it can be taken to pieces easily by the release of a few nuts, and every part withdrawn for scalding. The appliance is especially suitable for the poor districts of our large centres and towns, the inhabitants of which procure their supplies of milk in small quantities.

CONSTANT PURIFICATION OF WATER FOR PUBLIC BATHS.

There is probably no more acute question troubling those municipalities possessing public baths than the economical maintenance of the purity of the water therein. A constant supply of fresh water, though eminently desirable in the interests of those availing themselves of the facilities offered them, especially in the industrial quarters of a large town, is too expensive, with the result that the water is only changed twice or thrice a week. This difficulty, however, has now been successfully sur-

mounted by the engineer to a London borough council, and the baths in question have a constant and daily supply of fresh running water absolutely free from bacteria and other impurities. Nevertheless the same water is used over and over again. The idea itself is very simple. The water leaves the bath at the bottom at the deep end and passes over a screen, by which all impurities suspended in the water are arrested. It is then lifted by means of a double-acting pump to the top of the building, a height of some twenty-five feet, to a water-tower. Here it percolates through a series of three superimposed perforated large zinc trays, where it is submitted to the beneficial influence of sun, wind, and air, which thoroughly oxidises the water and kills all bacteria contamination. This operation completed, it gravitates into a large filter-tank, where the water is thoroughly purified, finally being heated to a temperature of seventy-four degrees Fahrenheit before entering the bath at the shallow end, opposite to that from which it was withdrawn. This process is continued throughout the day, and a constant stream of fresh water flows into the bath, so that this particular municipal authority in London has satisfactorily solved the problem concerning the maintenance of a pure supply of water in the bath. As this filtration and aeration plant is designed upon the most economical lines, the purification process is effected very cheaply.

INSANITARY COWSHEDS AND DAIRIES.

Strenuous efforts are being made to ensure the unimpeachable purity of our milk-supply, and heavy penalties are inflicted upon the salesman found guilty of selling doubtful milk. Yet so long as such conditions prevail in the cowsheds and dairies—the fountain-head of the liquid—as are described by the medical officer of health to the Wrexham Rural Council, the impurity of the beverage must continue and the propagation of disease flourish unchecked. This officer, after a prolonged study and visitation of the dairies and cowsheds, gives a grave word of warning. He states that many of the cowsheds are mere hovels, unlighted, unventilated, undrained—in fact, void of even the elementary principles of hygiene. He complains of the great accumulation of manure in the milking-sheds and the presence of large heaps of such offal outside the buildings. The udders and flanks of the cattle are in a most filthy condition, while even the milkers make no attempts to remove the encrusted dirt from their hands preparatory to milking. The medical officer calls for the ensurance of more sanitary conditions; though it would appear that such a development requires legislative stringency, since it is imperative that our milk-supply should above all things be far removed from suspicion. That private enterprise can achieve what ultimately the law will no doubt insist on is shown by the efforts of a company in the Thames Valley whose farm is an excellent model of what a dairy-farm should be. Here the animals themselves are groomed daily and nurtured like valuable horses; the dwellings are large, airy, well lighted, and built of materials which admit of daily scouring throughout, including walls, ceiling, and floor, with a hose; the milkers' hands and special garments worn while milking are sterilised, and the milk itself kept free from all exposure to contaminating influences or handling. Under these circumstances it is not surprising that the demand from such a farm exceeds the supply, yet it is only a pattern of what a modern establishment engaged in the production of such an indispensable article of diet should be.

REFRIGERATION *v.* LIME PRESERVATION OF EGGS.

Some interesting experiments have been carried out by a French scientist to determine the comparative effects of eggs preserved by freezing and lime respectively, the results of which have been communicated to one of the learned societies. He states that the former is much superior to the ordinary lime-system from the hygienic point of view, since under the influence of low temperature, even when maintained for several months, no perceptible change in appearance or taste of the egg results, and the article is suitable for any culinary purpose. One great advantage of cold-storage preservation is that the yolk of the egg retains its position in the white envelope and does not gravitate to the lower end, as in lime preservation. Nor does it spread out when the shell is broken. The albumen, however, becomes a little more watery, but there is no perceptible change in colour. It is essential that the temperature should be maintained at a constant point, and as near minus one degree centigrade, with a hygrometric degree as near seventy-eight, as practicable. In the United States refrigeration is the most generally practised form of preserving eggs, a practice that is, however, gradually becoming popular in Europe.

AN ADJUSTABLE STEAMSHIP GANGWAY.

Steamship travellers are aware of the inconveniences attending the boarding of vessels, especially the mammoth ships now engaged in the transoceanic traffic, by means of the ordinary gangway. If it is high-tide there is a steep climb from the jetty; while similarly at low-tide there is an abrupt descent to the deck-level, or possibly embarkation and landing are effected from a lower deck, leaving the passenger to wend his way from and to the higher decks through the crowded companion-ways. An ingenious adjustable gangway whereby these difficulties are overcome has been evolved, and is now in operation at a south of England port. The apparatus comprises a telescopic steel tower running on wheels, the platform of which can be raised and lowered. From the quay a long gangway leads to the platform of the tower, which is accommodated to the height of the steamer's deck, and from this another horizontal gangway leads on to the vessel. The result is that, no matter how high the

ship may be out of the water, the disposition of the quay-gangway is such that a very gradual gradient is produced, which is much appreciated by elderly and infirm passengers, while, furthermore, the latter are led direct on to the deck corresponding with the class of their tickets. The gangway, also, is of great value for the loading and unloading of live-stock, since it provides an excellent runway. Being built of steel, it is a substantial structure. Owing to the success of the apparatus at the English port, one of the German transatlantic steamship lines has installed a similar gangway at their terminal port at Cuxhaven, where its facilities are much appreciated.

SELF-LOCKING RAILWAY-CARRIAGE DOORS.

The number of fatal accidents that have resulted from the sudden opening of railway-carriage doors and precipitating the passenger on to the line has called attention to the expediency of devising a lock which would be incapable of opening until required. One of the latest of these is distinctly novel in design, the rush of air occasioned by the travelling train itself causing the door to be held firmly in the locked position. Along the footboard are disposed a number of small wind-hoods resembling an inverted cone open at the top. Above this latter opening is another small half-round hollow hood attached to the end of a rocking lever fixed to the lock itself. To the opposite end of this arm is pivoted another small arm, the free end of which in turn is connected to the catch or bolt. When the train is travelling the air is forced into the hood fixed to the footboard and rushes through the opening in the top thereof, thereby lifting the small hood on the end of the lever, so that the latter in turn forces home the bolt or catch of the door, holding it firmly in that position until the train stops, when the hood attached to the locking arm drops to a horizontal position, withdrawing the bolt. The apparatus is perfectly automatical, and can be adjusted so that it will act when the train is travelling at three or sixty miles per hour with equal facility. As there are no springs or other mechanism liable to derangement, there is no possibility of the apparatus failing to act. Tests with the appliance have demonstrated its reliability and automatic action, especially the automatic release of the door immediately the train comes to a standstill. The apparatus, owing to its simplicity, costs but a few shillings to attach to the door.

A NEW FREEZING-APPARATUS.

There was recently on view at an exhibition in Germany a new type of refrigerator, the feature of which is its simplicity and inexpensiveness, a sovereign or so completely covering the whole outlay. The appliance comprises a double-walled tin vessel with an annular space all round, about an inch wide, and completely surrounding the inner chamber. Carbonic acid gas is slowly admitted into this annular space at the bottom, and this, filling the whole of the space, finally issues into the chamber itself through a cross-armed tube placed at the top, quickly and completely freezing any article stored within. In fact, so efficient is the apparatus that water is frozen in less than a minute. The refrigerative effect is produced by the rapid expansion of the carbonic acid gas. The apparatus is stated to be highly suited to the requirements of the household, and is very inexpensive to work, the carbonic acid gas being stored in the ordinary type of reservoir used for that purpose.

THE EXTERMINATION OF RATS.

A short time ago we drew attention to the new means that had been devised, known as 'ratin,' for the extermination of rats by inoculative agency, this effect being produced by the consumption by the animals of a nutritive medium containing a virulent destructive bacillus. Various Governments on the Continent have submitted the system to searching experiment, and owing to its high efficiency are urging its utilisation by agriculturists, who suffer so heavily from this pest. Interesting demonstrations have also taken place in this country, and now the island of Cumbrae, which is overrun with the rodents, is to be systematically cleared by this virus. The action of the exterminator, upon ingestion, sets up a malignant stomachic inflammation closely similar to virulent typhus-fever, and the afflicted animal generally succumbs within forty-eight hours of partaking of the bait, which, owing to its delectable appeal to the rodent-palate, is greedily eaten. Practical and laboratory investigations over a prolonged period have shown that the substance, though highly destructive to the rats, exercises no ill effects upon human beings or farm-stock, such as poultry, cows, horses, pigs, or domesticated animals, with the exception of sucking pigs and young calves, which, being unusually tender, are susceptible to the organisms, which induce a form of inflammation of the bowels. The disease, after being contracted by one or more rats, spreads with lightning rapidity throughout the whole colony, few of which will be found to survive the attack. In Germany the farmers have had special facilities placed at their disposal by the Government whereby they can procure the virus, and it is hoped that by the co-operation of the agricultural community the numbers of rats overrunning the country may be appreciably reduced and kept in check, if not entirely eradicated.

SUBMARINE SIGNALLING.

Slowly but surely the means of extending warning to vessels of their close proximity to one another or to treacherous coasts during thick weather by the transmission of submarine signals is extending in this country. The unreliability of the ordinary bell or fog-detonator signals in fog has long been emphasised, and the strange caprices resulting from the transmission of sound-signals through the stagnant atmosphere are well known to every navigator.

The submarine system is very simple. In the fore-peak of the ship are carried two small tanks attached to the inner surface of the skin of the boat, one on either side. These tanks are charged with a special dense liquid, which, while eliminating the 'ship's noises'—that is, sounds set up in the ship itself—faithfully receives the sounds of a bell rung beneath the waves. Each tank is equipped with a very sensitive microphone, from which communicating wires extend to the navigating-bridge or chart-house, where they are connected to telephone receivers. By this means the officer can detect whether the warning is being extended to him from either the port or starboard side, or direct ahead, and from the intensity of the sound-waves can learn whether he is in close proximity to the warning-bell or not. Efforts are now being made to turn the invention to further use in connection with signalling between the units of a warship squadron and also for controlling the movements of submarines, which craft at present are without any means of communicating with their consorts while submerged. The invention should be full of great possibilities in this connection, since the tones of a bell can be distinguished at present over a distance of ten miles.

TO PREVENT TRAM-CARS SKIDDING.

The frequency of accidents caused by tram-cars running beyond control down declivities has directed attention to the necessity of devising some means of preventing the wheels skidding the track when the brakes are applied and the wheels are locked. It is obvious that this end could be assured if it were possible to apply any gritty substance in sufficient quantities to the bright, slippery surface of the rails, in which event any tobogganing on the part of the car would be impossible. The manager of one of our largest provincial tramway systems has evolved an apparatus based upon this principle, and the experience therewith over several weeks has demonstrated conclusively its efficiency, it being found possible to stop a fully laden car upon the steepest gradients within a few feet upon the application of the brakes, no matter how greasy the rails may be. The invention is fundamentally an improvement upon the ordinary sand-hopper and its operation. There are two hoppers placed beneath the vehicle—the main and the auxiliary—the discharge of sand and gravel from which is directed upon the track in front of the leading wheels. On the driver's platform is a pedal which, upon being depressed, causes a spray of sand to be thrown on the track. Should this, however, prove abortive in an emergency, the driver simply kicks away a stop which regulates the extent of the depression of the pedal, with the result that the latter can be forced down still more, and this action brings the auxiliary hopper into play, and a flood of sand is precipitated upon the lines, rendering it impossible for the wheels to continue skidding, so that the vehicle is pulled up quickly. In order to meet those conditions that occasionally arise by a tram running backward on an ascending incline, say through the current failing, the pedal is so arranged as to enable the hoppers to throw their contents upon the track in front of the reversed rear-wheels, so that the driver has no occasion to leave his platform or brakes. With such an apparatus it is impossible for a driver to lose control of his car so long as he keeps his head, while, moreover, no undue waste of sand is produced.

RURAL NOOKS ROUND LONDON.

Mr Charles G. Harper, who has a score of volumes already to his credit on various roads and counties of England, has turned his attention to Middlesex and Surrey, and published *Rural Nooks Round London* (Chapman & Hall), well illustrated and having a useful map. Mr Harper gives reasons why he has left London for the country around Petersham: the Metropolis has become more and more a place in which only the very wealthy can live with any degree of comfort. House-rents and rates have risen, and there is more elbow-room in the suburbs. Besides, he has found birds, squirrels, and sunshine; the nightingale sings continually on summer nights in Petersham woods; and the trunks of the trees, if you touch them, do not suggest that you have been groping up a chimney. Mr Harper chats pleasantly of Hampstead, Highgate, Golder's Hill, Ealing, Brentford, Hayes, Kingston-upon-Thames, and Hampton Court Palace. This is the kind of book which needs no apology for its existence, although the writer tells us that in making it he has discovered that the world is a much more serious place than it used to be. Amongst those buried at Petersham are Vancouver the pioneer traveller, the Berrys (who corresponded with Walpole), and the novelists Mortimer and Frances Collins. Samuel Warren rests at Esher; but why did Mr Harper not tell us something of the residence and tomb of Coleridge at Highgate? It would not take one but many books, of course, to hold the historical and literary associations of London suburbs.

PRISONERS.

Captives and prisoners of petty wars
To bitter tasks Day drives his weary thralls.
In vain to us the magic trumpet calls,
The unsparing sun its music mocks and mars:
Comes Night the Enchantress, crowned with dreams and stars,
And as the shadow of her coming falls,
Lo, how have crumbled into dust the walls,
How melted at her touch the prison bars!

Swift-winged even as the Seraphim,
Of night and sleep's great mystery made free,
Our flight is on the mountains vast and dim,
Our path is wide upon the trackless sea;
Youth, youth is ours, its glory and its pride,
Young hearts, young hopes, old comrades side by side.

A CHANGE OF FEELING.

By Frank H. Shaw, F.R.A.S.

IN TWO PARTS.—PART I.

HAZLITT lighted his cigar with a deliberation that was in itself suspicious. The cigar was one of those long spidery atrocities which a country well provided by nature for the growing of exquisite tobacco prefers to import from Italy, and the smell of the burning weed was indescribable. It reminded the young Englishman of a fire he had once been present at in his own rooms—something like burning rags, but worse. Courtesy, however, compelled him to do his duty, for the President of Fromania was a man with a temper, as the members of his Chamber of Deputies admitted with much spleen. But the sultry tropical atmosphere, combined with the reek of ferocious tobacco, made Hazlitt's head swim, and he waved his cigar tentatively towards the open window.

'Might as well try the open air,' he suggested; 'it would be cooler on the balcony.'

The President drew attention by a silent gesture to his entire person, which was scrupulously garbed in evening-dress. The unassuming black suited his Spanish cast of face remarkably well.

'Against the white of the house, señor?' he asked. 'It would be too conspicuous. Also, the moon is full.'

'But'—— began the visitor.

The President looked sharply out of the window, through which came the sleepy murmur of a Fromanian city street. Occasionally a mule-bell tinkled merrily, again a torrent of wild blasphemy would ascend through the palpitating air, then the scuffling of shod hoofs, afterwards silence. Then, with a clearness and vividness that was astounding, the steady staccato beat of human footsteps rang on the pavement below. The pupils of the President's eyes narrowed to pin-points, but he made no alteration in his position. He was the personification of watchful concentration. Hazlitt stared, understanding nothing.

Suddenly, with a rapid, tiger-like motion, the President caught the corner of the heavy shutter in his hand and slammed the whole structure to. Simultaneously with the action, a sharp crack echoed in the street, something struck the stucco wall with a queer splash, the footsteps rang loudly and hastily for one minute or less, followed by the deep boom of a carbine; and the President shrugged his shoulders expressively.

'No,' he said, relighting his cigar. Hazlitt noticed that the hand holding the match never trembled. 'No, my friend, we will remain indoors to-night. The evening air is unhealthy—is it not?'

'But it looked like assassination!' said the Englishman with heat. He had learned to like the imperturbable Spanish-American during the few hours he had known him, and resented the dastardly attempt on his life. It was the unconscious affection of one brave man for another.

'He will assassinate no more.—Ha! Enter, José.'

A knock had come at the door, and a smart-looking orderly stood waiting.

'A shot was fired, José?'

'Two, your Excellency. The second did not miss—between the shoulder-blades.'

'*Bueno! Vamos.*'

'*Si, Excellenzia;*' and the soldier saluted and was gone.

'You treat it coolly, President,' said Hazlitt. 'One would think it was an everyday occurrence.'

'It is frequent. There is much trouble in the country at present. Marconeza is desirous of being president; he has sown much sedition of late. Poof! it is nothing. It is what your London papers would call "a gingerbread revolution in a gingerbread country." But it is remarkably like a large war as regards the possibility of bloodshed.'

Hazlitt remembered then the air of expectancy that seemed to surround Porto del Fuegos when

 [*All Rights Reserved.*]

he landed that same morning from the Royal Mail boat. The custom-house officers who examined his baggage had shrugged expressive shoulders as he mentioned that his destination was *la casa del Señor el Presidente;* and, too, he remembered that the soldiers on guard at the gate of the residence looked more like men of war than the ordinary guards about a South American palace.

'In a word, then, you are on the verge of hostilities?'

'Exactly. There is still time, my friend, for you to reconsider your intention of staying as my guest for some time—as my honoured guest, Señor Hazlitt.'

The man addressed bowed his acknowledgment of the courteous suggestion, but smiled reflectively as he examined the gray, powdery ash on the *cigarro.*

'It would seem that I have come at a very fortunate time,' he said coolly; but his eyes were glowing with something that was not rage now—it was the light of the rising blood-lust. 'That is, if I can be of any service. I am here to help, señor, not for the look of the thing.'

Señor Castries made no answer to this remark at the moment, but he rose from his seat and strolled over to his companion. His long, slender fingers strayed over Hazlitt's sleeve, and he smiled with a keen appreciation as he felt the swell of the muscles under the cloth.

'I wish I had a hundred like you, señor; we should stand firmly in Fromania. But, alas! I fear that my rival has captured the best of our men for his own side. We shall see, however. Hush, my friend! not a word about that disturbance in the street. Here comes Jacinta and the coffee. Both are welcome, on my soul!'

The girl that came into the faintly lit saloon was a revelation to Hazlitt. He had been prepared for some extraordinary beauty, for he had seen her photograph in the illustrated papers many times; but these pictured presentations had not caught the wonderful expression of her face. It was like the play of sunshine over a summer lake; it was like the golden glory of a summer's dawn. Hazlitt's metaphors failed him at this juncture, for he was standing before her.

'Señor Hazlitt—my daughter Jacinta.' The President completed the introduction with a wave of the hand which indicated the fact that he had performed his share of the contract; the rest remained with the two younger people.

Jacinta came forward with an ease of manner that spoke of an English training.

'I am so sorry I was out when you called first, señor. It was a necessity. Besides, I did not know you were coming.' This was delivered in English as pure as Hazlitt's own, though there was a twang, it could scarcely have been called an accent, that made perfection still more perfect—at any rate, in the Englishman's ears.

'It was but prolonging the uncertainty, señorita; and the result was well worth the waiting.'

'That is very pretty—to a Fromanian girl, that is. But I am as much English as Fromanian, Señor Hazlitt, so its sweetness is wasted. Suppose we ignore the fashion of the country, and remember only the British portion of my upbringing.'

Five minutes later Hazlitt, sipping his coffee with a thoughtful air, had forgotten that Jacinta was anything but an exceedingly well-read fellow-countrywoman. There was a freshness and a naïveté in her attitude, an indescribable charm, that appealed to the man's inner consciousness. Unlike the majority of her fellows, Jacinta was brilliant without being overpowering; she charmed while she commanded admiration. The conclusion borne in upon Hazlitt was that the outward form of the girl was a fit casket for her mind. This was high praise, for he had previously considered women as a harmless—or harmful—necessity to the progress of the world.

The President rose presently and stretched himself. 'There are duties,' he said, and with a bow left Hazlitt and his young hostess together. The former moved quietly to the half-shuttered window and slammed it to.

'The next shot might not be a miss,' he explained; and then he could have bitten out his tongue for forgetting the President's warning.

'Then it was a shot? I thought so. Tell me, did the man escape?' The large eyes were filled with an inward fire; and, looking deeply, Hazlitt decided that this slender girl was a woman in spirit and courage. This is saying a good deal, for a courageous woman can give points to a Victoria Cross hero.

'Yes,' he replied, 'it was a shot. No, the man did not escape. Between the shoulders, José said.'

'Good! Oh, Señor Hazlitt, these are terrible times for Fromania! Everywhere there is talk of blood and murder. This evening, as I was driving to the palace, some ladrone threw mud at me. There were stones too; they rattled on the carriage. No, I did not tell my father; he is worried enough. Can you think what it is to him? He loves his people, señor; but General Marconeza has poisoned their minds. He tells them that papa desires to make the republic into an empire; that he will become emperor himself; that he will wed again—a woman of royal blood—and will reinstate the old order of things. It is awful! And the lies! Oh, fancy papa marrying again! He wears mamma's miniature round his neck day and night. I tremble every time he leaves the palace; for I know what he is—so impetuous when roused, though so cool, so icy, when in repose. He buried his warmth in my mother's grave.'

Jacinta was English enough to dispense with the usual Fromanian protection of a duenna. The ultra-conservative residents in the capital lifted their shocked hands to heaven when the subject was mentioned, unable to see how a woman could preserve her reputation without the watchful *gouver-*

nante to keep a constant eye on her life. But the girl gave no heed to them; she was wrapped round in a cloak of girlish purity. The most notorious of lady-killers felt himself abashed by the steady, level glance of her dark eyes. Hazlitt himself was possessed of a strange feeling as he watched her face. She was full of her subject; she had the love of her country at heart; but she palpitated with anger at the sense of injustice that was being bred amongst her people.

But the absence of the duenna was a good thing in this instance. It gave Hazlitt an opportunity to speak freely. He bent forward a little and gazed steadily into the girl's eyes.

'If anything I can do will help your father, Miss Jacinta—you see, I use the English form—you have only to command. I have grown to admire him.'

'Then you will stay? That is good of you! My doubts are removed. Tell me, Señor Hazlitt, does an Englishman always inspire confidence? My spirits have risen up there'—she indicated the superb roof of the apartment with a foreign gesture—'and I shall sleep to-night without listening for the sound of firearms.'

As the hours passed away Hazlitt found himself taking an unwonted interest in his hostess. She was full of a wonderful charm, she was utterly lacking in self-consciousness, and she soon forgot her anxieties in a flood of recollections of the England which she held only second to Fromania in her regard. Hazlitt retired that night a prey to sundry misgivings. He told himself that he, an old campaigner, should have been armed against the shafts of a girl of some twenty years only. He forgot that it was just because Jacinta levelled no shafts that he was compelled to admire her more than any woman he had ever met. When he fell asleep it was only to be haunted by dreams in which a midnight assassin crouched behind an open shutter and took pot-shots at the fascinating girl, who seemed entirely unconscious of all danger; and he awoke fighting with a sleepful agony.

Two days passed by without any manifestation from the revolutionary party. But each morning saw the lines on the President's forehead deepen, saw the watchful glitter of his eyes become still more watchful. Hazlitt, knowing what was at stake, admired the man more than ever. He had given up the useless fight against admiring the President's daughter—he knew now that she was the only woman in his world; and he sighed, for, after all, a half-pay captain in the British army may be a desirable person, but he is not an eligible *parti* for a President's daughter. For Jacinta herself he could not say. She gave no hint that her affections were stirred; meeting him as she did, with the open frankness of a girl, he could only wonder and despair.

'It will be to-night, I think,' said the President coolly, as he and his guest smoked their cigars after dinner. 'I wished Jacinta to go up the hills to the bungalow, but she would not. She is hard to persuade, that Jacinta. So was her mother. She will stay here and see the thing through, she says.

'It is a pity,' said Hazlitt. 'Women are in the way in these affairs.'

'If she is like her mother in one respect she will not be in the way—or, rather, she will be very much in the way. But Jacinta has not yet been in a revolution. We shall see.'

The two men talked on, avoiding, as brave men will, the possibilities of danger. The President discussed the measures he had taken to guard against surprise, and the Englishman approved of the steps taken.

'The National Guard will hold fast,' said Castries. 'There are a thousand of them; but the irregular troops have gone over in a body to Marconeza. There are five thousand of them; so we are overmatched, but not beaten, my friend—oh no, not beaten! We shall put up a good fight, as you say in England. But I would rather have Jacinta safe.'

A sudden earnestness came into his voice as he laid his hand on Hazlitt's knee. 'You will see that nothing happens to her—excepting death, of course? The irregulars are rather savage at heart; there is much that is bad of the Spaniard in them, and more that is bad of the Indian. Not a pretty combination. They are devils from Hades, señor—I know, for I have seen them. Ugh!'

Hazlitt took out a little revolver from his hip-pocket. It was a dainty little toy, not of much use perhaps, but still sufficient to kill at short range. He snapped open the breech and extracted the five little shells.

'I ask your permission to make the señorita a small present,' he said smilingly. His eyes were very grave though his lips were creased.

'She prefers a stiletto. She knows; but it may be impossible for her to take that measure. You will do as I ask?'

'Certainly. But it will not be necessary.'

The President shrugged his shoulders, and, rising, went to the window.

'There is much commotion in the town,' he said; and Hazlitt was able to distinguish an uneasy murmur that seemed to fill the air. It was the seething mutter of the breaking storm.

'They will attack the palace first,' said Castries; 'they always do. My men are picketing the streets, so we shall see some fun presently. Ah, that is the beginning!'

A single shot rang out like a whip-crack. The rush of hurrying feet rang loudly for a moment, and then a sentry doubled across the open *plaza*. He turned as he ran, lifted his carbine to his shoulder, and took a hurried snapshot at the darkness. The crack of his weapon was answered by an appalling scream; then a loud torrent of oaths and cries volleyed towards the listeners.

The President had changed into evening-dress

with the same nonchalance that the French *noblesse* displayed on the eve of a greater revolution than this; but he now left the apartment, and reappeared in a few moments dressed in the full uniform of a general of the Fromanian army. Hazlitt raked out an old campaigning suit that was full of slits and patches; the native hues of it were faded out of all recognition, but the lack of general colour was made up for by some sinister smears of a dirty brown.

'My old South African gear,' he explained in apology. 'I shall feel more comfortable thus.'

Jacinta entered the room at this moment, and her eyes dwelt for a moment admiringly on the broad back of her father's guest. Hazlitt looked well in khaki; the closely fitting tunic seemed to bring out the full splendour of his figure. But he was watching the scene in the *plaza*, and so did not notice the girl's entrance.

'You have understood my orders?' asked the President a little later, as he noticed his daughter's presence. Hazlitt turned in surprise. The girl saw then that the man she had known so far and this cool, alert soldier were two very different people. For the Englishman's jaw was set like a rock; also, the level glance of his eyes had taken on an added sternness. He had just seen the revolutionists drag a wounded aide-de-camp from his horse and hack him to pieces with their knives and swords.

'We'd better go down now, I think,' he said sharply. 'We shall be needed in another minute or two.'

Two or three glittering officers stood outside the great gate of the *patio* as the President and Hazlitt descended. A brisk, animated conversation passed in Spanish between the leaders; and Hazlitt, although not fluent in the tongue, gathered enough to make him still further admire his host. Yes, the chief of the officers—he wore the badge of a colonel—informed the President, the houses were all full of loyal troops. They would keep up a cross-fire on the *plaza* until the numbers of the revolutionaries were sufficiently thinned to permit of a charge. Then they would get the cavalry to bear on the subject, and after that there would be much slaughter.

'It is good!' said Castries. 'Form up two companies of your men under the walls of the palace. They will prevent the insurgents from entering. My daughter is within,' he added simply.

The colonel bowed. 'She shall be our constant care, *Excellenzia*. But it would have been better had she gone to San Juan. They are out of place at times, these women.'

'You knew her mother!' replied the President, as if that were all the answer required.

The moon had risen and was flooding the great *plaza* with her still, pale light. The heavy trees were unmoved, for there was not the slightest rustle of breeze, and a fountain in the centre still played on, giving a weird air of peace to the place that was soon to run red with the blood of fellow-countrymen sacrificed to please an upstart's ambition. The advancing revolutionists had retired momentarily; but hoarse, exultant cries came up from the shadows of the radiating streets. Hazlitt had fought through more than one town, and he knew the work would be hot and fierce in the narrow ways—while it lasted.

'Here they come!' cried Castries, loosening his sword.

Hazlitt unbuckled his holster and drew out his revolver. It was the sort of work he loved, and he had eyes for nothing else, save that at the back of his mind the President's request still hung. He would keep one shot, whatever happened; but he prayed that he might be spared that awful deed.

Suddenly the rising clamour rose to a steady yell. Then, like a transformation-scene at a pantomime, the opposite faces of the houses broke into a sheet of flame. The rattle of musketry, unintermittent, harsh, menacing, filled the *plaza;* and out of the darkness of the corners men rushed wildly. Some carried torches; but they were not needed, for the scene was as bright as day. The insurgents advanced to the houses that were alive with shot, and beat with frenzy on the doors. Their blows could be heard even above the crackle of musketry.

The colonel was watching the upraised hand of the President impatiently. He gnawed his sweeping moustache, for he was not at one with him in the humanity that bade him to spare the rioters. He would have them shot down like the dogs they were.

And then, just as the crash of breaking wood came across the square, just as the shots began to lessen in rapidity, Castries's hand fell. Two hundred rifles flashed and roared, and the scene became a shambles. Men were mowed down like grass; they fell in ghastly piles across the pavement; their shrieks ascended to the deep vault of the sky like the wail of the condemned. For a moment there was no sound save the click of the breech-bolts as the Guards reloaded. It was terrible, but it was necessary. Another volley, and still another, and the advancing party was checked. They retired, breathing fierce anathemas on their enemies, and the loyalists had a breathing-space.

While they watched impatiently, sounds as of muffled firing came to their ears; then the houses opposite became a veritable pandemonium.

'They have broken in through the back!' gasped the colonel. 'God help the men there!'

The President nodded gloomily.

The clamour lasted only for a minute or two, and then was succeeded by an ominous silence. No one knew what the issue of that fight had been there in the houses, but all guessed. They knew the comparative numbers of the opposing forces. Still the colonel gnawed at his moustache; still the President gazed unwaveringly in the direction of the corner from which the next attack was to be expected.

(To be continued.)

THE TRUTH ABOUT THE MERCHANT SERVICE.

SOME months ago, thanks to the efforts of one or two of the daily papers, the British public was made somewhat uneasy about the state of the mercantile marine. It was not a very deep-seated feeling, it was not of long duration, but it was there. This was not perhaps a great deal to base hopes of reformation upon; but it was the first gleam of sunshine that had come the way of the seafarer, the first faint promise of a fairer dawn, and for a time the merchant service indulged in dreams which have made a return to the old despondent outlook even more depressing than it was before. It is, however, something to have aroused such a feeling, transient though it was, for the complacency of the British public is hard to shake, and about their shipping they have always been complacent. Of all our industries, this is the one they look upon as particularly English, and it is hard to make them understand that all is not well with our huge mercantile marine.

The amount of tonnage flying the British flag, the number and size of vessels turned out by our yards, in comparison to the figures shown by our rivals, is indeed sufficiently pleasant reading. Because officers can yet be found to man all these ships, and perhaps also because that dear, easy-going public wishes so much to believe that all is well, the recent newspaper revelations of the waning popularity of the merchant service as a profession have only ruffled and not seriously shaken the truly English belief in the strength and durability of our maritime position. It is a thousand pities that this is so, for in very truth the mercantile marine is in a critical state.

For the ever-lessening supply of officers ample and sufficient reasons have been given: the abominable conditions under which a sea-apprenticeship is served, the low scale of pay obtaining throughout the merchant service, and the humiliating strictures placed upon officers in even our best lines—these are the chief causes that threaten in the near future to make us dependent upon foreigners for the officering of our ships. The question which this suggests, and to which an emphatic 'No!' is the only possible reply, is: 'Can we depend on these foreigners to form the reserve for our navy?' for this must ever in time of war be a vitally important duty of the officers and men of the mercantile marine.

The reduced and ever-decreasing supply of officers has, it is true, lately forced employers to make a slight increase in pay. This increase, however, has been so small that it has failed materially to alter the situation. No attempt whatever has been made to remove the other causes of the present discontent with the sea-career that is felt in all ranks of the profession. This is strange enough, for it is obviously to the advantage of employers to have contented officers, obviously to their advantage to keep up the supply by treating these officers as gentlemen. But custom dies hard, and it appears to have always been the custom to treat seafarers with a lack of consideration shown to no other class of workers in the country. How great this lack of consideration, how hampered and humiliated all the officers in even our best lines are by unnecessary and often degrading regulations, is not in the least degree realised by the public.

In one of our best lines—indeed, the line which is generally considered the premier service of Great Britain—embarking passengers often notice that the officer in charge at the gangway keeps as much in the background as possible, in striking contrast to the smiling doctor and smirking stewards who are with him and under his control. Few people realise why. It is because he—the man in charge, the man to whom the directors look to keep discipline—is the one man whom those same directors never acknowledge. This man is forced to stand there utterly ignored, while his employers pass on to shake hands and engage in conversation with the doctor, chief steward, purser, any one indeed save the executive officer. A small matter? Possibly; but it is the small affairs of this life which are often the most galling and hard to bear. In the same great service, officers are required to have the highest qualification conferred by the Board of Trade—namely, an extra master's certificate; they are furthermore expected to hold a commission in the Royal Naval Reserve. It would appear probable that these officers would have a very enjoyable time, meeting many pleasant people who cross on the ships. But no! The directors, in their wisdom, have decreed that officers must not speak to passengers. Why? Well, that is a question that many people, officers and passengers alike, wish to have answered. It can hardly be that the directors who draw up these regulations imagine their officers are not fitted socially to mix with the passengers, since these men perform twelve months' service in His Majesty's Navy, where they mix on a footing of equality with officers among whom are to be found scions of almost every noble family in Great Britain. What the humiliation of this regulation is to any high-spirited man can easily be imagined, yet it is a regulation which obtains in five out of six of our leading lines. In the particular service which the writer has in mind this rule was the outcome of two men forgetting the moral integrity which was due to their position. These men, however, were not executive officers, but a doctor and a purser, who is in reality the captain's clerk. Yet, while *this regulation was enforced in the case of the executive officers, it was not, and is not, in the case of the doctors and pursers of the company.* Apart from all else, the short-sightedness of this policy is

apparent to all save the promulgators of it. The writer alone knows of a round dozen cases where friends of officers have left an English line when informed that they could have no intercourse with the employés, to go to a German line where no such restrictions exist. If one man who has not sought for evidence has had twelve such cases brought to his notice, how many passengers must the German lines gain every year from this one cause alone?

Furthermore, the evil does not end with the loss of passengers. It seems strange that it never occurs to the directors that they are making it a very difficult matter for their officers to keep discipline in their ships. It is surely bad enough for the stewards of the ship to know that financially they are better off than the men who bear the responsibility; it is infinitely worse for them to know that these officers are hampered, galled, and humiliated by their employers. And they do know it, for they see it and read it. They see it when a director meets a ship's officer; they can read it when they like, for the regulations for officers, engineers, and stewards are printed in one book.

Any one hearing for the first time of the state of affairs existing in our merchant service would naturally imagine that it has primarily been brought about by the officers themselves. This is, however, an error. As a body, it can safely be affirmed that they are second to none in loyalty and conscientious execution of duty. There are black sheep in every fold, but it is surely an easy matter for any company to discharge a servant who proves himself an undesirable. But this policy has never been considered sufficiently drastic. In nearly every line the misbehaviour of one man is invariably followed by punishment in the shape of one more galling regulation meted out to all.

At all events, it may be argued, officers can study and read, and so occupy their spare time. Yes, if they bring their own books; but—*officers are not allowed to use the ship's library.*

The writer has throughout had one great service in mind, because it is the service with which he has had the closest dealings. But, bad as it undoubtedly is, it is yet, from an officer's point of view, one of the best. It may seem strange that this statement should follow the preceding remarks. However, in cases of accident in this line the officer usually has justice; in many, very many services he has not. There are firms of high standing in Great Britain where an accident to any ship means the dismissal of all officers belonging to that particular vessel, the men who were asleep suffering equally with those who were on duty at the time of the mishap. In this line, galling and humiliating, even degrading, as some of the regulations are, they are yet mild in comparison with the rules to be found in the books of many other shipping companies.

These, then, are the conditions under which an officer must serve his employers. It is for a life such as this that he has passed years of semi-starvation and total misery in sailing-ships; this is the goal which he has always had in view, and to gain which he accepts the lowest salary that any profession returns to its followers. And still the public wonders why fewer boys are going to sea. Yet employers ask why so many officers leave the profession for work on shore.

And it might be so different! The sea is essentially a manly life, and appeals now as it has ever done to the youth of England. The call of the sea, that mysterious, intangible attraction that it has ever held for our island race, is still strong, strong as it has ever been since it made our country what it is. Will our shipowners never see that it is to their interest, to put it on no higher basis, to keep that attraction alive by treating their officers as they would wish their own sons to be treated by those who employ them? Will the directors of our large mail and passenger lines never realise that their officers are gentlemen, and, that being so, that they must resent humiliating rules such as exist in nearly every great shipping company? Will the public never understand until it is too late that this great industry of which they are so proud, this huge mercantile marine which dominates the over-sea trade of the world, is sick and ill, bitterly and justly discontented? Of all servants, merchant service officers have ever, as a body, been most loyal. Will no one seek to right their wrongs; will no one, while there is yet time, strive to avert what must eventually be the result of a continuation of present conditions—the officering of our mercantile fleet by foreigners? No calling better deserves fair-play, no profession needs it so much, and no industry is so vital to the well-being of our country, whose proudest title has ever been 'The Mistress of the Seas.'

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire, How England Saved Europe*, &c.

CHAPTER XVII.—THE TRIAL.

AS he stood and watched the figures that came and went in the broken light of the torches, Jean caught a glimpse of the Rat, who was one of the turnkeys of the prison. But he tried in vain to arrest the eye of his old comrade. That the Rat recognised him Jean did not doubt, but fear prevented any signs of recognition being given. Presently, however, he brushed closely past Jean and whispered in his ear, '*La petite* comes next. I knew you would come, and I kept her back.' Then he hurried away.

Jean stood watching the door, with a strange weight on his heart.

It was his plan—he could, in the agitation and hurry of events, think of no other—to make some passionate appeal to the judges; but as he looked at them his heart fell. Their faces were as hard as granite. Human lives to them were only counters in the great game of the Revolution. They would not risk the game for the sake of allowing one of the human 'counters' to escape. And Jean realised, as he studied their countenances, that here were men carried out of themselves by great forces. They had the glittering eyes, the hurrying speech, the iron resolve of fanatics. Human nature shaken with lunatic terrors, or on fire with wild and vain hopes, can be strangely pitiless; and the men who sat round the table in the room at the Abbaye that wild night were in this mood. Jean had counted on Toulan; but as he glanced at his face he could see that Toulan himself had given up hope. The current ran too fiercely and was too strong for him to wrestle with it.

The moments seemed to creep past on leaden feet. At last the turnkey drew back the bolt, and madame was led betwixt two guards. Amid all the horrors of that night Jean was startled by the change in her appearance. Her hair was gray, her features drawn. The beauty of the clear complexion and the deep star-like eyes had vanished. Fear had written its dark hieroglyphics on every line of her face. She walked with dragging feet, like a woman who had been drugged, leaning heavily on one of her guards, and was apparently only half-conscious of the scene about her.

But Jean cast only one hurrying glance upon that picture of wrecked beauty. He saw Denise! Her face was strangely pale and thin; but the tender lips were firm, the pure eyes were bright and alert. Her glance fell upon Jean; and as their eyes met her steps were half-arrested, but it was only for a moment. She stepped to the front with quick, light feet, put her slender hand on the table, and leaned forward. Her eyes ran quickly to and fro upon the countenances of the judges, and as she did so a sudden silence fell on the group about the table. A face so young, so sweet, and yet so brave suddenly emerging from the confusion and terrors of the night startled them. Its clear purity visibly acted on them like some touch of magic. They felt for the moment as if *they* were on their trial.

Denise was fighting for her mother's life, and every sense was alert.

'Monsieur,' she said, 'of what is my mother accused?'

The sweet voice deepened the effect of the pure face and the clear eyes. The president took up the sheet on the table before him and examined it.

'She is accused by the People of conspiring against France.'

'Never!' cried Denise in a tone of proud scorn. 'Never! She has served France. She has suffered for France.'

'But she lived in England,' said the president, 'and married an Englishman. She is in the pay of Pitt.'

'My mother married a noble Englishman, for love knows nothing of nationalities; and she sacrificed her happiness for France. She has served it against England. If she were in England to-day its prisons would open their doors for her.'

At this moment Toulan leaned over and whispered something to the president.

'Why are you here?' asked the president, looking at Denise. 'Your name is not in the list.'

'I have never been accused. It is not by any warrant I am detained. I became a prisoner because I am a daughter, and the place of a daughter is by her mother's side. If the friends of the king had triumphed, and you, monsieur, were in prison, would you not wish your daughter to plead for you?'

She seemed a creature compounded of air and fire, so slender and light, and yet so swift and clear and fearless. Here was love in its highest terms—love that forgot itself, that was on fire with pity and courage.

'France knows nothing of fathers and daughters,' said the president after a brief pause. 'She knows only her friends and her enemies.'

'But my mother is the friend and servant of France.'

'That is true,' said Toulan, breaking in on the dialogue. 'This woman, it is known, was the agent of France in England, and Pitt, if he could, would lay hands upon her. Whoever accused her,' he went on loudly, 'is doing the work of Pitt.'

'Eh?' said one of the judges, a little, red-headed man with sharp features and huge, round spectacles. He peered forward, and looked steadily at the

haggard face of madame. 'Yes,' he said; 'I was in the Foreign Office, and the prisoner was certainly employed in its service in London. Some papers of value to France were obtained, and madame had to flee from London or she would have been arrested.'

'Shall your hands do Pitt's work against a true Frenchwoman?' asked Denise, as her eyes ran keenly along the faces of the judges in turn, and her voice was keener than her glance. 'There was no complaint in Paris against *ma mère;* it was in London she was accused.'

The judges put their heads together and held a whispered conference. One after another, in turn, looked at the haggard, broken woman, leaning half-swooning on the shoulder of the turnkey who held her, then at the slender figure of Denise, with her pure face and steady eyes.

'The testimony of Citizen Toulan,' said the judge, 'clears your mother.' Then he took off his cap. 'France admires good daughters.—I see nothing to condemn in the accused. Do you agree?' he asked, turning to his fellow-judges.

The swift, strange drama had drawn the attention of all in the room, and at the president's words they broke out into loud 'Bravos.'

'This woman,' said the president, 'may go free.'

'Give her a certificate to that effect,' suggested Toulan.

The president drew a sheet of paper to him, and wrote on it swiftly but with care, consulting more than once with the little, red-headed judge as to some phrase. When he had finished he read it aloud with visible relish. It ran:

'At the Abbaye, year four of Liberty and first of Equality: We, commissionnaires appointed by the People to try the prisoners detained in the Abbaye, have made to appear before us, this 2nd September, the woman Thiebault, accused of conspiring against France. We have found the accusation to be false, and have declared her innocent in the presence of the People, who applauded the liberation which she received from us. We invite all citizens to grant her aid and protection. (Signed) MAILLARD.'

Judges and turnkeys broke into a murmur of applause. They enjoyed the sonorous phrases. This terrible tribunal could talk, if need required, in the accents of the ordinary courts.

Then the president thrust the paper into the hand of Denise. 'Discharge the prisoner,' he cried.

The guards led madame to the door, Denise holding her mother's dress with her left hand; her right by this time was in Jean's grasp. For a moment the group stood on the threshold looking down on the court. It was strewn with dead bodies. In front, with the light of torches falling on their sabres and pikes, was the crowd of executioners.

'Hats off, citizens!' cried one of the guards. 'Behold her for whom your judges request aid and protection.'

'*Vive la nation!*' shouted the crowd.

'I want four honest citizens who will conduct this innocent woman to her home.'

Several at once ran forward, but Jean still held to the hand of Denise, and was accepted as one of the four. Two of them secured torches, and they proceeded to cross the court. They had not reached the centre when a side-door opened. There ran—or rather leaped—out the wild figure of a naked man, his white skin showing the red marks of many pike-wounds. He fell, struggled to his feet again, and ran on with fierce gestures and stumbling feet. Three men with gleaming pikes were pursuing him.

'Madame is dying!' Toulan cried suddenly.

Denise, before her eyes had taken in the scene, turned at the sound and threw her arms about her mother. The adroit Southerner shouted the words in order to save the girl from seeing the bloody picture.

'Let us get away from this place,' Jean whispered, 'or the sight will kill them.'

The little group hurried on again. As they neared the gate the light of the torches fell on a figure that seemed in strange contrast with the scene about him. His dress was rich; he wore a small puce coat, a black wig, and an official scarf.

'It is Billaud de Varennes,' whispered Toulan to Jean, 'the deputy of the attorney of the Commune.'

The figure in the puce coat walked composedly over the dead bodies lying in the court.

'Citizens,' he said in a loud voice, 'you are doing your duty. You have destroyed a set of scoundrels. France owes you eternal gratitude, and the municipality will know how to make a return to you. I am deputed to offer each of you twenty-four livres, which are to be paid to you immediately. Continue your work,' he cried, 'and the country will be grateful.'

In the records of the Commune is still preserved a document which shows that the promise of the man in the puce coat and the black wig was kept.

Meanwhile, the group with madame and Denise had struggled through the crowd. A carriage was secured, but whither was the unfortunate woman to be driven?

'Let her come,' said Toulan after a moment's hesitation, 'to my house. My wife will take care of her.'

When they reached his house the guards were dismissed, and Toulan's wife, with the help of Denise, carried off the sick woman to her room.

Then Toulan broke into a shout of delight. 'Ah, it was wonderful! It was clever! *La petite* is wonderful! To bring in Pitt! The one name those men hate as much as they hate the Capet.'

For three days the flame of life fluttered in madame's breast, and then went suddenly out. The months of imprisonment, the terrors that had

hung around her day and night like a garment of flame, the wild scene in the Abbaye, were too much for a nature that had in it so much of the butterfly. She never fully recovered consciousness. Jean saw her once. As her glance fell on him dark memories in the dying woman's brain seemed to awaken. A strange and inscrutable expression stole into her eyes. It might have been remorse—Jean could not interpret it. It was the symbol of feelings to which he had no key.

When she died, and the furtive, hurried funeral was over, Denise was left alone. She and Jean had not exchanged many words. Every moment had been given to the dying woman. But now, as the two sat together, the sad eyes of the poor girl shone with gratitude.

'Oh Jean,' she said, 'how good you were to come to us!'

'I did nothing by coming,' he answered ruefully. 'I stood like a fool in that dreadful room at the Abbaye. I meant to speak, though my blundering lips could not have helped you. But you gave us no time. You fought your own battle, Denise; you shamed us all;' and he looked with new wonder at the girlish figure that had played so brave a part in that wild scene.

A faint colour stole into the poor girl's cheeks at his words. 'Ah, I forgot everything except my poor mother, broken-hearted and gray-haired, and about to be flung to the pikes;' and her eyes kindled afresh with a flame of courage as she recalled the scene. 'But, Jean,' she whispered softly, 'you helped me.'

'I?' he asked, in wondering tones.

'Yes. Do you remember giving me this?' and she drew from a fold in her dress a little, battered book with broken covers. It was the Bible Jean had given her in that midnight scene on the stairs in madame's house. 'If I had no other companion in the Abbaye, I had this book. And, oh, how it talked to me! And that dreadful night when we knew murder was on foot, and were waiting to be called in our turn, I saw poor mother could say nothing on her own behalf. I was thinking what plea I could urge for her, and I saw in the book this;' and she held up the page to Jean. '"*It shall be given you in that hour*," the words ran, "*what ye shall say*." I knew it was a message,' said Denise, as her eyes kindled and her cheeks flushed, 'and it *was* given me.'

Whether Denise's use of the text would have satisfied an unimaginative theologian may be doubted; but Jean at least accepted it with implicit confidence. The great words of the Bible are, in hours of supreme need, renewed in their application to each human soul in turn, and through all the centuries.

'But, Jean,' Denise said, looking at him with grateful eyes, 'you were good to come and risk your life for us. For we had no claim on you. M. Duclos turned mother's heart against you. You were cruelly wronged, and in the Abbaye mother saw it, and grieved over it. She would not talk about it. She never told me why you were hated or what the plans of M. Duclos were. Perhaps I guessed;' and the poor girl broke into a passion of sobs.

The question had to be settled as to her future, and there was no time for delay. Of one thing Jean was clear. Paris was no place for her. He would take her to London. He had already written to his aunt saying that madame was certainly dying and he must bring Denise to Portman Square. Mrs Robert Lawrence read the letter with grimly shut lips. She could not yet forgive Denise for being the daughter of her mother.

Toulan energetically approved of the plan. 'We shall have darker days yet in Paris. It will be no place for anybody with English blood or English connections. You must both go.'

With his command of the secret agents of the English Foreign Office, Jean had no trouble in reaching the French coast and crossing to England. As they drove to Portman Square he looked at Denise. The heroine of the Abbaye had shrunk to a pale-faced girl with quivering lips and shaking nerves.

'You fear my aunt,' he said, 'more than you did the judges in the dreadful room that night.'

'Ah, that was different,' she sighed, and would say no more.

Mrs Robert Lawrence first fell on John's neck and kissed him again and again with energy. 'You brave, foolish boy!' she said.

Then she turned and looked with what were meant to be coldly questioning eyes at Denise. But the girlish face—all purity and sweetness—the wistful eyes, the trembling hands and lips, were too much for Mrs Lawrence. She took Denise to her arms without a word; and with the gesture of a tired child the poor girl put her head on Mrs Lawrence's shoulder.

'This child is going to be ill,' Mrs Lawrence announced, and swept Denise away into her own bedroom.

Illness came in an obstinate and severe form. For weeks Denise lay betwixt life and death. Through the chambers of the unconscious girl's brain all the terrible figures of the Abbaye came and went in unceasing procession. Never was nurse more tender or patient than Mrs Lawrence. She plucked Denise from the very touch of death. Henceforward she had an absurd, jealous, and yet tender sense of absolute proprietorship in the girl. Madame faded completely out of existence. Denise's history, as far as Mrs Lawrence was concerned, began from the moment when she had put her arms round the girl's neck on the night Jack brought her to Portman Square.

(To be continued.)

A WEEK AMONGST BRIGANDS.

By F. Cowley Whitehouse.

OF late years the Smyrna *vilayet* has been notorious for the numerous acts of brigandage which have been taking place in it. For six years a certain Tchakidji Mehmet has been busily engaged in carrying off and holding to ransom a large number of wealthy natives, Turks, Greeks, and Armenians. By reason of his daring and recklessness, he ranks as the chief of all brigands in the province; but in a smaller way others have emulated his deeds, and several Europeans have had the bad fortune to fall into the hands of one or other of the bands which are continually scouring the country.

The latest victim is Baron Willem Van Heemstra, a son of the Master of Horse of the late King of Holland. He has been living in the Smyrna *vilayet* for the past ten years, and is married to a daughter of Mr Richard Whittall, a member of a family very well known in the Near East. Devoted to an out-of-doors life, he has taken up farming as an occupation, and three years ago purchased the *chiflik* or farm of Oglan-Anassi. This last word denotes 'the Mother of Sons,' which implies that the ground is extremely fertile, as the Turks draw a great distinction between the bearing of sons and of daughters. Some of them go so far as to say that female offspring are not to be counted as children.

On this farm Van Heemstra is working with the greatest energy, and has succeeded in infusing some of his own enthusiasm into his assistants. He is a fine horseman and an astonishingly good trainer of horses. To sit beside him when he is driving tandem is to realise what perfect control may be obtained over one's animals. He does everything by word of mouth. The horses are trotting steadily together. '*Mashallah*,' he says to them, and instantly the pace changes to a canter. A piece of heavy road is encountered. 'Pull away, boys!' and on the word Vlango (chestnut) and Doree (bay) break into a furious gallop. 'Enough now!' and back the obedient and willing pair go into the correct trot.

But last May a misfortune overtook this energetic young farmer. He was captured by brigands and ransomed for the large sum of six thousand liras. It came about in the following way.

Circumstances arose which made it necessary for Van Heemstra to visit a small *chiflik* in which he has a share. Arriving there from Oglan-Anassi, he transacted his business, lunched with the owner, and immediately afterwards mounted his horse to return. On the way he passed through the village of Devlikeh ('Place of the Camels'), and called at a farm belonging to a Greek named Adamopoulo, who is an American subject. Here he found the farmer engaged in conversation with Mr Harris, the American consul-general, who had come out by train from Smyrna to settle some question between Adamopoulo and the Turks. After an hour or two Van Heemstra accompanied Mr Harris to the station, and then started off to return to his own farm. On the outskirts of his property he came to a sharp descent, and on account of the number of loose stones in the roadway he pulled his horse back into a walking pace. As he did so a man jumped out into the middle of the path, and, levelling a Graz rifle, shouted roughly, 'Get down!'

Van Heemstra realised instantly that a brigand was accosting him; but, seeing no one else, he pushed on a few paces before coming to a knowledge of the fact that four or more rifles were pointing at him from the side of the road. Seeing no help for it, he dismounted, and two men came forward and asked him for his revolver. By chance he happened not to have any weapon with him. The men were armed with rifles, revolvers, and long knives thrust through their red waist-sashes. Each man had two hundred rifle cartridges and forty revolver cartridges. Except for the red sashes, they were dressed in European fashion; and afterwards it transpired that they had posed as tobacco-planters who had come to inspect a big plantation which was for sale. The captive was led to a plane-tree and told to sit down. He was offered some cognac, and the leader of the band was evidently annoyed by his refusal to drink any of it. He was told that other men who had been taken captive had fainted from terror, and that he might do the same.

'By no means,' replied Van Heemstra. 'Why should I faint? I have done no wrong. My conscience is clear of offence in this matter. Why should I faint? Keep the cognac until it is needed some cold night.'

By this time Van Heemstra knew that he was in the hands of the notorious Capitan Andrea, a brigand who for several years had met with considerable success in his calling. His first exploit was to exact a ransom of two thousand liras from a certain Sadik Bey at Sokia, and soon afterwards he received four thousand liras to liberate a rich Turk of Magnesia. Two years ago Kara (Black) Halil, a friend of his, was taken prisoner, and was offered his freedom if he would betray Andrea into the hands of the *zaptiehs* (military police). He agreed to do so—a fact of which Andrea was soon made cognisant. The *capitan* determined to punish his quondam friend. One night he pounced down on a farm where Kara Halil's cattle were feeding, and swept away fifteen head. The night-guard, a recklessly plucky fellow named Saali, thought, however, that Andrea ought not to be allowed to have things all his own way. He jumped on his horse and followed in hot pursuit. He overtook the robber in a *dereh* (valley), and opened fire on him. Andrea

warned him to go back, but Saali fired again. Once more Andrea warned him, but Saali pressed on; and at last Andrea, a first-rate shot, turned upon him, and shouting out, 'That's how you shoot, is it?' fired and mortally wounded the unfortunate guard.

But perhaps the most daring of Capitan Andrea's exploits was the abduction in broad daylight of a Turk named Hassan Bey from the aqueducts close to Smyrna itself. On this spot people are continually coming and going, and Andrea shot down four armed Cretans before he was able to carry off his prisoner.

Knowing that this man was in the habit of ill-treating his captives, Van Heemstra determined to give no handle of offence.

'Look here,' he said to him in Greek, 'this is a bad job for me; but if you will let me go I promise that you shall have one thousand liras paid to you to-morrow, and I guarantee that there shall be no pursuit and no trouble for you afterwards.'

'Ten thousand liras,' briefly responded Capitan Andrea.

'Ten thousand!' echoed Van Heemstra. 'Why don't you make it twenty, or, better still, thirty thousand? I am a poor farmer, and one thousand is the utmost I can scrape together.'

'Lies!' ejaculated the *capitan*. 'And even if you were a poor man, your father-in-law has plenty of money, and he can pay for you.'

'He will not pay.'

'Ten thousand liras, or—your head;' and so the discussion ended.

Van Heemstra was next instructed to write a note to his manager at the farm telling him what had happened and mentioning what ransom was demanded. The order was obeyed, and in addition the manager was asked to send Van Heemstra his walking boots, cap, and coat, besides five loaves of bread, olives, and two *oques* of tobacco.

A passing shepherd was stopped and bidden to go to the farm and give the letter to Mr Hermann Hatton, the manager. The brigands gave instructions as to the way in which an answer was to be brought. A single messenger was to be sent to a lake close by after sunset. He was to light three matches every five minutes until the brigands met him.

A faithful negro groom named Achmet was entrusted with this task, and on his arrival he handed over the articles that had been asked for, and requested permission to speak to the captive. Van Heemstra at once declared that he had no secrets, and bade Achmet return and tell his friends that he could not visit them at present, as he was entertaining five guests out on the mountains.

The brigands called upon Van Heemstra to accompany them.

'Hadn't you better tie me?' he inquired. 'There is some light rope in my *heebeh*' (saddle-bags).

'Why should we tie you?'

'Well, I may chance to stumble, and some of you impulsive gentlemen may think I am trying to escape, and so I may get a bullet or two in my body.'

'If we decide to tie you, we have plenty of rope of our own,' replied Andrea.

Achmet was sent back with Van Heemstra's horse, and the brigands set off for the mountains. All night they walked up and down the hills until they arrived at the Tachtali Mountains. There they sat among the pine-trees, but in such a position that they were able to command distant views, and to be certain that they would not be surprised while they slept.

Van Heemstra found it difficult to sleep. He watched continually for an opportunity to escape, but two of the brigands lay one on either side of him, perfuming the air with their garlic-laden breath and their frowsy garments. They also slept with their legs across his, in order that the slightest movement on his part should not be unobserved. So the day passed, and at seven o'clock that evening Van Heemstra was forced to write another letter, stating that if six thousand liras were not paid his head would be sent down to Smyrna. Van Heemstra protested again that he was a poor man.

'We know all about that,' replied the *capitan;* 'you may be a poor man, but your wife's father is Edward Whittall, and he is a rich man.'

'No,' said Van Heemstra; 'you are making a mistake. Edward Whittall is a rich man, but he is not my wife's father. Richard Whittall is my father-in-law, and he is a poor man.'

'Lies!' responded the chief.

One of the band was listening to the conversation, and at this moment interposed. To Van Heemstra's astonishment, he spoke in English. He proved to be a Greek who had been for a long time in America, and had served on American ships.

'How can you say you are poor?' he demanded. 'You have a farm for which you gave six thousand liras. Sell it, and pay us what we ask.'

'I borrowed the money to buy my farm, and I have not yet paid the whole amount.'

'Lies!' ejaculated the chief again.

'Well,' said Van Heemstra, 'it is no good my saying anything if you tell me I am lying. At least send across to the Nymph Dagh (mountain), and there you will find Edward Whittall's bulb-pickers, and ask them if their master is my wife's father.'

The Nymph Dagh was not very far distant, and two men did go across, and found that their captive had told the truth; but this made no difference, for a message was sent down to Richard Whittall at Bournabat, a suburb of Smyrna, warning him that Van Heemstra's head would assuredly be sent down to Smyrna unless the six thousand liras were sent up at once into the mountains.

Van Heemstra was spending an anxious time. The brigands frequently threatened him, and Capitan Andrea told him he was fortunate not to have been tortured.

'But why should you torture me?' inquired the

captive. 'I have done you no harm, and I have made no attempt to escape.'

'It is our custom to torture those who fall into our hands,' replied Andrea, and broke out into a tirade against the rich. 'Why,' he commenced, 'should you be rich and we poor? And why should you be called *chellabi* [master or gentleman], and I be called Andrea? Isn't it absurd that there should be *chellabis* in this world? Is not one man as good as another?'

'But I don't want to be called *chellabi*. Call me what you please. Call me Andonaki [little Antony], or Kyriako, or anything else you please.'

'All rich people are bad,' urged the chief.

'Perhaps so, but I am not rich; and when you have finished with me I am going to be very poor indeed, and you will be rich, Capitan Andrea.'

'Yes,' persisted Andrea, 'rich people are all bad. Do they help the poor? No. They work us hard, and give us as little pay as possible. But look at me. I shall take your six thousand liras, and go away with them. I shall see a poor man working in his fields with a single buffalo. I shall say to him, "Why don't you work with two buffaloes?" and he will tell me that his other buffalo fell and broke its leg, and that he has no money with which to buy another. Then I shall undo my waistband, and I shall take out some of your liras and give them to him, and say, "Go, my friend, and buy another buffalo, and thank God and Capitan Andrea."'

'Very kind of you to give away my money like that,' said Van Heemstra dryly.

The capture had taken place on Thursday, 23rd May, and on the following Sunday Richard Whittall sent Mr Wallace Turrell and a Greek guide to treat with the brigands. They brought two thousand five hundred liras with them, and begged that the captured man might be given up. They explained that Van Heemstra was really not a rich man, and that he worked on his farm in Asia Minor in order to earn his daily bread. A long discussion took place, and it seemed as if an agreement might be arrived at. Andrea was in favour of accepting the offer; but the man who spoke English got into a very excited state, and strongly objected to any abatement in the ransom. He urged that the full amount should be exacted, and that an ear or finger of Van Heemstra should be sent down to Smyrna to prove that they were in earnest. Finally his counsel prevailed, and the envoys had to go back and report that the brigands demanded, and would accept not one piastre less than, six thousand liras. In the meantime they retained the money that had been brought, and bade Mr Turrell say that they intended to wait only a day or two before setting off to Broussa, situated on the Sea of Marmora.

Van Heemstra was not allowed to see the envoys, and so he was more or less in ignorance of the state in which the negotiations were.

The messengers had brought up a big rice *pilaff* with them, as well as bread and a couple of bottles of whisky. Van Heemstra was made to partake of the food to prove there was no poison in it. The brigands waited for an hour to see if there were any ill effects, and then they rapidly demolished the remainder. Van Heemstra drank some whisky, but the brigands could not wait long before tasting it, and the two bottles were soon emptied. The men grew quarrelsome, but they left Van Heemstra alone, and only bickered amongst themselves.

Three days passed, and the captive saw no avenue of escape opening to him. Every day the band wandered about between Tachtali and the Nymph Dagh, and only two of them were allowed to sleep at the same time. In the morning the English-speaking Greek would come and call Van Heemstra.

'Now then, sir, the bacon and eggs are ready; or perhaps you would like some sardines or an omelette; and will you have tea, coffee, or cocoa?' and then Van Heemstra would gnaw a crust of dry bread and wash his breakfast down with snow water from the mountain.

Down in Smyrna Mr Richard Whittall had determined to send up into the mountains the remaining three thousand five hundred liras. He realised that the brigands intended to hold out, and that any further delay might involve serious consequences for his son-in-law. A number of men were therefore chosen to carry the gold. They took with them food, and a change of clothes for Van Heemstra, and five suits of Albanian clothes. These latter the brigands had demanded, thinking that it would be easier for them to escape in such a disguise. Van Heemstra failed to understand why some Elliman's embrocation and a bottle of camphor-oil were included, and a bar of soap was not of much use to a man who had not seen water for thirty-six hours. It came out afterwards that the English-speaking Greek had asked Mr Turrell for the embrocation on the plea that Van Heemstra had strained a muscle in the leg. He now wanted to know if the camphor-oil was meant to be applied to the moustaches.

The messengers arrived in the Tachtali district on the Thursday morning. They paid over the money to the brigands, and remained with them until four o'clock in the afternoon. At that hour a move was made, and the whole party tramped steadily across the country for three hours in the direction of the Cassaba district. The food which had been sent up was eaten, and the messengers were despatched on their return journey with a present of twenty-five liras in their pockets. One man, Manoli by name, was detained in order to guide Van Heemstra down to Bournabat. After dinner the brigands bade farewell to their victim. They gave him two liras, facetiously describing the gift as travelling-money. As is usual in these cases, they asked his pardon and kissed his hand before starting him off on his journey. The two

hurried across country at their best pace, and at midnight they reached Bournabat safe and well.

At the request of Mr Richard Whittall, the Turkish authorities had held back the soldiers from pursuing the brigands. He thought that if the men were hard pressed they would probably murder Van Heemstra and scatter in different directions over the mountains; but immediately after Van Heemstra's return the troops were let loose, and were soon hot on the track of the heavily laden brigands. A rifle, revolver, two hundred cartridges, and one thousand two hundred liras in gold is no light burden for a man, and that was the load that each of the brigands was carrying. They hurried to the town of Axar, where for two days they lay hid in the house of a certain Hadji Vassili. On the third day they left this man's house. He received fifty liras from them, and promised to buy them a horse and take it to a spot arranged upon near a wood. Vassili was to lead the horse to the wood and to cry out, 'Andrea!' and the brigand was forthwith to show himself.

Meanwhile a carter named Redjeb got wind of this arrangement, and promptly informed the *kaimakam* (town governor), urging that here was an excellent opportunity to lay the redoubtable and troublesome Capitan Andrea by the heels.

Vassili was arrested, and was told that he would have to show the soldiers the spot where Andrea was to meet him. The wretched man had no choice in the matter, and at the appointed time he went to the wood, while seven soldiers concealed themselves in the immediate neighbourhood. Vassili called 'Andrea!' and Andrea jumped out of the wood. He was greeted with four or five rifle-shots, but made a rush to get back under cover. Just as he reached the trees another volley was discharged, and he fell wounded to the ground. The soldiers made no attempt to capture the other brigands, who withdrew through the wood with one of their number wounded by a rifle-bullet. Andrea was secured, and on his person was found the sum of one thousand and eighty liras. Four days later he died in prison. The other wounded brigand was caught the next day, and on him were found six hundred and fifty liras. The three others made their way to Papasli, a village frequented by tobacco contrabandists and all sorts of bad characters. They have not yet been taken by the authorities, but Saadin Bey, the commandant pasha, is after them, and unless they have been murdered by their associates for the sake of the rich plunder on them, there is a good chance of the recovery of a considerable portion of Baron Van Heemstra's ransom.

THE TRAGEDY OF A NOBLE POACHER.

By H. A. Bryden.

INCE the days of William the Conqueror there have been innumerable tragedies connected with poaching. The saddest instance of which we have record is that of the young Lord Dacre of the South, who, in the reign of Henry VIII., suffered an ignominious death by hanging at Tyburn for his share in the manslaughter of a forester during a poaching affray while in pursuit of a neighbour's deer.

The Dacres were an ancient and noble family long settled at Hurstmonceaux, in east Sussex, where an ancestor, Sir Roger de Fiennes, built, in the reign of Henry VI. (about 1440), the castle of Hurstmonceaux, the noblest example of brickwork now (although in ruins) to be seen in England. Hurstmonceaux lies midway between Battle and Eastbourne, amid pleasant hills and a beautiful park, just upon the edge of the wide marshes of Pevensey. It was anciently the seat of the De Hersts, afterwards of the De Monceux family, the last male of whom died without issue in 1320, leaving as heiress of the estate a sister, Maud, who married Sir John de Fiennes. Descendants of the De Fiennes remained in possession of the place until the reign of Queen Anne, when, in 1708, it passed out of their possession. Sir Roger de Fiennes, the builder of Hurstmonceaux Castle, was a notable warrior, as had been so many of his crusading ancestors. He fought under Henry V. in the famous victory of Agincourt, and during the minority of Henry VI. served in the French wars under the Duke of Bedford, taking with him from Hurstmonceaux thirty men-at-arms and ninety archers. Sir Roger's noble castle, which is said to have cost in the building no less than seventy thousand pounds of our money, may be regarded as the forerunner and ensample of the magnificent Tudor brickwork of the following century. Built of small hard bricks brought from Flanders, it stands in a large parallelogram, surrounded by a moat now long since dry. The grand machicolated towers which adorn its front are pierced and loop-holed for bow and cross-bow and matchlock-gun defence, and the entire walls are embattled. Above the central arch is still to be seen the crest of the De Fiennes—an alant or wolf-dog bearing in its paws a banner charged with three lions rampant. In all England there is not a more picturesque memorial of the feudal past than Hurstmonceaux Castle, nestling amid the fairest scenery of woodland and park, its frontal towers looking across the marshland of Pevensey to the very spot where Duke William of Normandy landed with his host and took seizin of English soil.

Sir Roger de Fiennes was succeeded by his son Richard, who married the daughter and sole heiress of Thomas Lord Dacre, and who himself was, in right of his wife, created Baron Dacre in 1458.

This family thenceforth became known as the Lords Dacre of the South, another branch of the family being referred to as the Lords Dacre of the North. Richard Lord Dacre was, like his father, a distinguished personage. He was Constable of the Tower in 1473, and at a later period became one of the Council of Edward IV. To him succeeded, in 1484, his son Thomas, second Lord Dacre of the South, then a minor, who during the earlier portion of his life gave promise of occupying as distinguished a position in the world as his ancestors. At the early age of twenty-one he was already Constable of Calais, and for many years seems to have been high in the favour of Henry VII. and Henry VIII. The favour of the Tudors was, however, a perilous and uncertain thing, and towards the end of his life this Lord Dacre stood under the shadow of disgrace, and was for some time imprisoned in the Fleet under the charge of harbouring and aiding suspected felons. The second Lord Dacre died in 1534, leaving explicit directions for the rearing of a magnificent tomb to his memory. In Hurstmonceaux Church, close to the old castle, are still to be seen the noble effigies of this baron and his son, Sir Thomas, each clad in complete armour, resting side by side under a stately canopy of Sussex marble.

The third Lord Dacre of the South, who came to so untimely an end, was no more than seventeen years of age when, at the death of his grandfather just referred to (his father, Sir Thomas, having predeceased him), he succeeded to the estates and title. In spite of his grandfather's disgrace and imprisonment, this Thomas, third Lord Dacre, became possessed of great wealth, a fine castle and estate, an ancient title, and all the immense advantages which so high a position among the aristocracy of England then conferred. Whether owing to his grandfather's misfortunes or from other causes is not known, but it seems to be certain that the youth's education had been neglected, and that he was of a reckless, if not a profligate, nature. He married young, as was the custom of those days, and by his wife—a daughter of the Earl of Abergavenny, one of the proud and powerful family of the Nevills—he had at the time of his unhappy death three children.

Notwithstanding his grandfather's misfortunes and disgrace at Court, the young Lord Dacre seems to have enjoyed some share of the favour of Henry VIII. When Anne of Cleves landed at Dover in 1540 he was in the company of the Duke of Norfolk and Lord Mountjoye, and met that lady at Rainham Down, between Sittingbourne and Rochester. These nobles are described as robed 'all in Coates of Velvet, with Chaynes of Gold.'

Lord Dacre, as had been the immemorial custom of his class, was an ardent sportsman. In the fair country round about Hurstmonceaux he hunted and hawked freely. Red and fallow deer at that time still ranged in the feral state among the great woodlands of Sussex, the remnants of that vast forest of Andreds-weald which in Saxon times covered the whole country from Kent to Hampshire. Wolves had been exterminated, but the wild boar still fed among the forests of Ashdown and other places. Hawking, a favourite pastime of English nobles, was constantly indulged in. In Hurstmonceaux Park a heronry, still found hard by at Windmill Hill, had long existed, and over the wide Pevensey Marshes Lord Dacre and his friends flew their falcons at the great gray herons, as well as at wild duck, partridges, and other game.

In 1541, when he had barely attained the age of twenty-four years, the young lord gaily enters upon the adventure which brought him to his miserable end. He and some of his associates seem to have cherished a good deal of ill-feeling against his neighbour, Sir Nicholas Pelham of Laughton, a place which lies some ten or twelve miles to the west of Hurstmonceaux. Pelham was a member of an old and very distinguished Sussex family, the descendants of which are now Earls of Chichester. He had a mansion and park at Laughton; but it was not, as has been generally stated, actually at Laughton that the fatal affray for which Lord Dacre suffered took place. Laughton was judged by Pelham not to be so suitable for the maintenance of his deer as another park which he possessed a few miles nearer Hurstmonceaux, at Hellingly; and at Hellingly it was that the poaching encounter took place.

On the 20th April 1541, according to the charge subsequently laid against Lord Dacre, he with thirteen others 'did assemble at the mansion of the Lord Dacre at Hurstmounceux, and did there illegally conspire in what manner they could best hunt in the park of Nicholas Pelham, Esquire, with dogs and nets called buckstalls, and bound themselves by oaths, &c., for such illegal purpose, and also to stand against all the lieges of the king and to kill any of the king's lieges that might oppose them.' It is probable that the latter portion of the charge was deliberately overcoloured. It is scarcely likely that even reckless young men such as Dacre and his friends had the least intention of harming any of the king's lieges. They wanted an adventure or a frisk, and they meant to have it at the expense of Nicholas Pelham, against whom Dacre probably bore a grudge in connection with sporting rights. At all events, ten days later, on the evening of the 30th April, Lord Dacre, with seven others, including the three particular friends and allies, Mauntell, Frowdys, and Roydon, who suffered with him, took their way with retainers, dogs, and deer-nets to Hellingly. They were in two parties, and one of these—Lord Dacre's—having reached Hellingly, which lies only some five miles from Hurstmonceaux, presumably began or were about to begin operations on Sir Nicholas Pelham's deer. They were interrupted by three of Pelham's foresters, John and James Busbrigge and Richard Somener, and in the affray that ensued John Busbrigge was so severely beaten and wounded that he died two days later. It seems to be clear from the evidence given at the subsequent trial that Lord Dacre himself had no actual personal share in the

attack. Still, he was present, and was no doubt the responsible and directing personage.

Up to the fatal assault on the forester the affair had been nothing more than the freakish outbreak of well-bred youth, probably inflamed by wine and high living. Tragedy now steps in and marches henceforth with dire and certain swiftness. Sir Nicholas Pelham was not the man to allow so gross a wrong to go long unpunished. Warrants were sought for and issued, and before long Lord Dacre and his seven associates were in prison. Dacre himself was committed to the Tower, where, strangely enough, the Constable was Sir John Gage, the head of an ancient Sussex family whose seat is still to be found at West Firle, near Lewes.

Froude in his *History of England* says, concerning this affair: 'Had Lord Dacre been an ordinary offender he would have been disposed of summarily. Both he and his friends happened to be general favourites. The Privy Council hesitated long before they resolved on a prosecution, and at last it is likely they were assisted by a resolution from the king.'*

The trial of Dacre took place before Lord Chancellor Audley, the Lord High Steward, to aid whom was summoned a jury of seventeen peers. These peers were the Marquis of Dorset; the Earls of Sussex, Derby, Rutland, Huntingdon, Bath, Hertford, and Bridgewater; Lord John Russell, High Admiral of England; and Lords Morley, Cobham, Powys, Stourton, Mountjoye, Windsor, Mordaunt, and St John. When the indictment was prepared, says Froude, 'the peers held a preliminary meeting to consult on the course they would pursue.' 'I found all the lords at the Star Chamber,' Sir William Paget wrote to Wriothesley, 'assembled for a conference touching Lord Dacre's case. They had with them present the Chief-Justice, with others of the King's learned Council; and, albeit I was excluded, yet they spoke so loud, some of them, that I might hear them notwithstanding two doors shut between us. Among the rest that could not agree to wilful murder, the Lord Cobham, as I took him by his voice, was very vehement and stiff.' The peers adjourned presently to the King's Bench, where the Lord Chancellor presided as Lord High Steward, and Dacre was brought to the bar. He pleaded not guilty; he had intended no harm, he said, and he was very sorry for the death of the forester; but it had taken place in an accidental struggle; and 'Surely,' said Sir William Paget, who was present, 'it was a pitiful sight to see a young man brought by his own folly into so miserable a state.'

'The lords,' says Froude, 'as it seems they had determined among themselves, persuaded him to withdraw his plea and submit to the king's clemency. He consented, and they repaired immediately to the Court to intercede for his pardon.' But Froude omits to state that meanwhile judgment had been passed, under which the unfortunate prisoner had been sentenced to be hanged. Camden, the learned author of *Magna Britannica*, says that the murder could not have been proved upon him if he had maintained his plea of 'Not guilty,' for he was not in the fray. 'But some courtiers, who gaped after his estate, persuaded him to plead guilty and submit himself to the king's mercy, which they took care he should not have, and so he lost his life, honour, and estate at once.' There is a mystery about the fate of this misguided yet unfortunate youth which has never been cleared up. Why did Henry VIII. not only suffer him to be executed and forfeit his estates, but deny him even the poor honour of being beheaded, accorded in those days to all peers of the realm? Froude says: 'The young nobleman was the chief object of commiseration; but the king remained true to his principles of equal justice; the frequency of crimes of violence had required extraordinary measures of repression; and if a poor man was to be sent to the gallows for an act into which he might have been tempted by poverty, thoughtlessness could not be admitted as an adequate excuse because the offender was a peer.'

But Froude was notoriously a thick-and-thin admirer of Henry, his policy, and most of his acts. By this time, 1541, that king—a gorged, pain-racked, uncertain-tempered tyrant, diseased in body and blood-thirsty in mind—was declining towards his own miserable end. The executions during his reign, and especially during its latter portion, were very numerous. Blood only seemed to satisfy him. The plundering of the monasteries had rendered him always avid for further spoil, if not for his own present behoof, for the benefit of his favourite courtiers. It is probable that the considerable estates of the young Lord Dacre, now at his mercy, were of importance in his eyes; and it is possible, also, that he had never forgiven nor forgotten the offence, whatever it may have been, which had led to the disgrace of Dacre's grandfather and to his long imprisonment in the Fleet. How otherwise can we account for the condemnation of this unfortunate young peer to the last disgrace of hanging, instead of according him the more honourable death by the headsman?

To the very last Henry seems to have been of two minds concerning Dacre's fate. He was named for execution on the 29th June, but was reprieved for four hours. Was this reprieve with the object of squeezing some concession out of the miserable youth? Camden says that the courtiers, hungry about the king for the condemned man's estate, missed it, for on examination it was found to be too strongly entailed. Holinshed, in his *Chronicle*, tells the sad story of the end: 'And afterwards, the nine-and-twentieth of June, being St Peter's Daie, at eleven of the clock in the forenoone, the Sheriffs of London, accordinglie as they were appointed, were ready at the Tower to have received

* Surely Froude is wrong here. The forester Busbrigge died on the 2nd May. Lord Dacre was executed on the 29th June. If we remember the difficulties of communication in those days, events seem to have moved to the fatal ending with surprising swiftness.

the prisoner, and him to have led to execution on the Tower Hill; but as the prisoner should come forth of the Tower, one Heire, a gentleman of the Lord Chancellor's House, came and in the King's name commanded to staie the execution till 2 of the clock in the afternoone, which caused manie to think that the King would have granted him pardon. But nevertheless at 3 of the clocke in the same afternoone he was brought forth of the Tower, and delivered to the Sheriffs, who led him on foot betwixt them unto Tiburne, where he died. His bodi was buried in the Church of St Sepulcher's. He was not past foure-and-twenty yeeres of age when he came, thro' this great mishap, to his end, for whome manie sore lamented, and like-wise for the other three gentlemen Mauntell, Frouds, and Roidon.'

Why, then, was young Dacre first to be taken to execution on Tower Hill, why reprieved for four hours, and then led ignominiously on foot to the shameful death (especially shameful to a proud noble of those days) by hanging at Tyburn tree? There is deep mystery in all this which has never yet been cleared up, and probably never will be.

Of Lord Dacre's associates in the slaying of the forester Busbrigge, four were reprieved. The remaining three, Mauntell, Frowdys, and Roydon, were hanged at St Thomas Waterings, at the second milestone on what is now known as the Old Kent Road. This seems anciently to have been the first watering-place for pilgrims on their way to Canterbury out of London, and was a well-known place of execution in those days.

Thus untimely ended the young Lord Dacre of the South, stricken from the world almost ere he had attained full manhood. Says Horsfield, the Sussex historian: 'The king's inexorable rigour in not showing him mercy seems to have called forth much censure.' The young lord's death was long lamented, and even now the tragedy of his ending vies in its piteousness with that of the young and promising Earl of Derwentwater in 1715, whom old Northumbrian peasants still lament. Lord Dacre left two sons, one of whom, Gregory, succeeded to the estates and honours, which were completely restored to the family in 1558. This Lord Dacre died without issue in 1593, when the estates passed to his sister Margaret, wife of Sampson Lennard of Chevening, Kent. This lady was formally recognised as Baroness Dacre in 1604, and her descendants subsequently enjoyed the title as well as the castle and estates of Hurstmonceaux.

It is not a little curious that the very spot where the fatal affray took place which led to the execution of Lord Dacre is still perfectly well known, and can be pointed out to those interested in such details of the past. In the charge laid against Lord Dacre and his wild companions this spot is described as 'Pykehey, in the parish of Hellingleigh.' In the year 1868 Mr T. Horton, writing to the well-known Sussex antiquarian, the Rev. M. E. Lower, on this subject, said: 'Pick-Hay is an arable field of ten acres on the Horselunges Farm, in the parish of Hellingly, adjoining a field called the Cabins on the Broad Farm, rather less than a quarter of a mile S.W. of Hellingly Church, on the road to Horsebridge. The river Cuckmere is the boundary of the two fields. The actual scene of the murder is in the hollow of the two fields and near the river. In my youth the tradition of the murder was current, and I may add that a ghost has always been about the place.'

It is remarkable that the tradition of an affray so fatal for five of the parties concerned in it should have endured so long. Horselunges Farm, one of the oldest manor-houses in Sussex, still exists. It is so ancient that it may well have been coeval with the very tragedy that has been described. The writer saw it not long since, and viewed at the same time the very spot on 'Pick-Hay' field where Busbrigge the forester suffered his fatal injuries.

A SONG OF REGRET.

The sun sinks down, the long lagoon
Reflects his fading light;
The wild-duck calls, the eastward stars
Hasten approaching night.
The slow breeze sighs, and flax-blades stir,
My camp-fire brightly gleams;
I light my pipe, and suddenly
Come half-forgotten dreams.

Ay, half-forgotten dreams that once
Were life when life was young,
Ere sordid work filled hurrying days,
And hopes aside were flung.
Only in moments such as this
Those dreams come back again,
Stretching imploring, empty hands,
Moving dumb lips in pain.

Oh Mary of the sea-blue eyes!
Do you remember still?
Or has time brought you other joys,
New love your life to fill?
Do you look back with sad regret
Or forward with no fear,
Forgetting one who oft forgets
Yet holds your memory dear?

Ah, love! to-night, your hand in mine,
Again you pace with me
In the dim light that sandy road
That stretches to the sea;
The stars are shining through the mist
Like eyes that laugh through tears.
Ah, no! two oceans us divide
And twenty misspent years!

Lights out! The camp-fire flickers low,
Grows gray; my pipe is dead.
Old Rufus, lying at my feet,
Uneasy lifts his head.
Mary! no doubt fair children call
You mother; some one claims you wife.
Out, foolish dreams! And yet—and yet,
Mary, once mine, good-night—my life!

OLD SCOTTISH CHARM-STONES.

AMONG the various fields of research into the manners and customs of our ancestors, there are few which have a greater fascination than the beliefs and superstitions that they held and the magic rites they practised. In the hills and glens of the north and the dark lochs and seas and misty islands of the west there still linger beliefs and ideas which the spread of School Board education is rapidly exterminating. Some of us yet keep a corner in our hearts for these ancient tales, and a belief in charms and spells is inherent in human nature. We still decorate our chains with coral charms against the evil eye, or with 'lucky pigs' and 'lucky beans.' 'Beliefs pass on to half-beliefs, and thence to myths; and it is difficult to know when a faith has passed into a fancy. The pious rites of one age are become the pastimes of another, and an old superstitious practice becomes in time a childish game.' We are told that the child who makes a collection of the white pebbles from the gravel is following a tendency evinced by prehistoric man; certain it is that the use of white pebbles as charm-stones is very early recorded. We read in Adamnan's *Life of St Columba* that the saint on one occasion took a white stone from the river Ness and blessed it, and sent it to be used for the cure of the Druid Broichan.

Old beliefs die hard, and in Scotland many superstitious observances were deeply rooted in the hearts of the people; and old pagan and popish beliefs were cherished for long by the side of the stern doctrines of Calvinism, in spite of the denunciations of the clergy. But the spread of education and the spirit of the age have now swept most of them into oblivion. Song and dance, music and story, folklore and charm, have gone, and much valuable insight into the history of the people has gone with them.

A good deal of information about charm-stones has been collected from various sources; and many specimens of the stones are preserved in museums. Most families of consideration throughout the Highlands possessed at least one; and although many are lost or their existence unrecorded, yet a certain number are still to be found, and of some of these this paper attempts to give a record. They are of many kinds, the more important, or those which attract more notice, being spheres of rock-crystal, usually polished and unset, or set in metal, as the means and taste of the possessor permitted. In size and shape they vary; but they are generally round or egg-shaped. These stones brought good luck and victory in battle and healing from sickness to the possessor, and were also used for the cure of disease. In all countries and ages crystal balls have been held in estimation. They have been found in Saxon graves and tumuli, and may in these early times have been used either as amulets or charms or for purposes of divination, or possibly merely for ornament. Mr George F. Black, in his interesting monograph on this subject published in the *Proceedings of the Society of Antiquaries of Scotland*, says the round balls may have first been used as *vexilla*, and borne into battle to ensure victory. Two well-known crystals, the Clach-na-Bratach (or Stone of the Standard) and the Clach Buaidh (the Stone of Victory or Stone of Power), may both have been used in this manner.

In the Highlands these balls were called Leug or Leigheagan. Leicc or Leug is defined in Shaw's Gaelic Dictionary as, 'a precious stone, diamond: in the Highlands, a large crystal, of a figure somewhat oval, which priests keep to work charms by; water poured upon it is given to cattle against diseases.'

In the early part of the nineteenth century the Clach-na-Bratach is recorded to have been used in the prescribed manner by the chief of the Clan Donachaidh, to whom it belongs. It was dipped with much ceremony into a bowl of water, which was then distributed to a number of people who had come from far to obtain it for medicinal purposes. This charm has been in the possession of the chiefs of the clan since 1314. The story of its finding was as follows: When the chief was on his way with his followers to join the Bruce's army before Bannockburn, on lifting his standard one morning this glittering ball was found in the earth clinging

 [*All Rights Reserved.*]

to the flagstaff. He accepted it as a good omen, foretelling victory; and ever since the stone has been bound up with the fate of the clan, and has accompanied it in the keeping of the chief whenever it was 'out.' The eve of Sheriffmuir showed a flaw within it, in sympathy with the fortunes of the clan, which then began to decline. Another tradition says that before the death of a chief the stone becomes dim and damp. The Clach Buaidh was once in the possession of the Campbells of Glenlyon, but its present resting-place is unknown.

The Clach Dearg (the Stone of Ardvoirlich) is a rock-crystal sphere in a setting of four bands of silver, and was used as a charm chiefly for the healing of cattle, people coming a long distance to obtain water in which it had been dipped. Its use was hedged about with careful formulæ. An incantation or prayer was pronounced before immersing it in the water; and if the stone itself was lent to any one at a distance, the person going to fetch it 'must not speak, nor sit, nor enter a house, nor be found outside a house after sunset.'

Another stone of the same type as the Ardvoirlich Stone was the Keppoch Charm-stone, which was also of rock crystal, about the size of a small egg, set in a silver bird's claw, and suspended from a silver chain to facilitate its being dipped in the water. This stone is now supposed to be in Australia, as the owner emigrated there in the early fifties. The following is a translation of the Gaelic incantation used with it:

Let me dip thee in the water,
Thou yellow, beautiful gem of Power!
In water of purest wave,
Which (Saint) Bridget didn't permit to be contaminated.
In the name of the Apostles twelve,
In the name of Mary, Virgin of virtues,
And in the name of the High Trinity,
And all the shining angels,
A blessing on the gem,
A blessing on the water, and
A healing of bodily ailments to each suffering creature.

The Glenorchy Charm-stone, in the possession of the Marquis of Breadalbane, is smaller, and the crystal is set with a solid backing of silver. It is referred to in the *Black Book of Taymouth* as 'ane stane of the quantitie of half a hen's egg, sett in silver, being flatt at ane end and round at the other end lyke a peir, quhilk Sir Coline Campbell, first laird of Glenurquhy, woir quhen he faught in the battell at the Rhodes agaynst the Turks, he being one of Knychtis of the Rhodes.' This stone was long used as an amulet and also for healing of cattle.

At Dunollie two crystal balls are preserved whose fame for curing was very great. Tradition says they were brought from the Holy Land by a crusading Lord of Lorn.

An elaborately mounted ball belonging to Colonel Gordon of Inverleny is said previously to have been in the possession of the Gordons of Carall for six hundred years.

An unmounted crystal ball used as a charm against the evil eye was recently shown in Glasgow, and has been the property of the Campbells of Blarachorine for generations.

Another unmounted crystal ball which is in the museum of the Irish Academy is reputed to have belonged to the Regalia of Scotland. It was sold to the Academy about fifty years ago, and was formerly owned by the Campbells of Craignish. This may be the 'pretious stane' mentioned in a deed of 1610 as a property of much value, 'ane hundred merkis money' being 'pryce and value of the said stane.'

Another round crystal ball, set in hoops of silver and suspended by a chain, belongs to the family of Thriepland of Fingask, and at present is on loan in the Museum of Science and Art in Edinburgh.

In addition to these special rock-crystal charms there were numberless other stones which were held in high esteem for their curative powers. With the exception of a few, they were mostly used for the cure of murrain in cattle or ailments of that type. The laird of Inchbrakie has in his possession a blue stone said to be an uncut sapphire, which is preserved as a talisman. The story connected with it is that Kate M'Niven, the Monzie witch, who was burned about 1715, as she was tied to the stake spat it out of her mouth to the laird as a charm to ensure a direct heir and preserve the property, and it has been kept carefully in the family ever since.

The 'Lee Penny,' which has gained additional fame as being the original of Sir Walter Scott's 'Talisman,' is almost the only well-known charm belonging to a Lowland family. According to Charles Kirkpatrick Sharpe, it is a small, dark-red stone set in silver (a groat of Edward IV.), said to have been brought from the Holy Land in the fourteenth century by Sir Simon Lockhart of Lee. Definitely recorded cases of its use are as a remedy for 'the routting evill, a strange and sudden diseas' of cattle; in the seventeenth century as a remedy for an epidemic of plague at Newcastle; and in the eighteenth century it cured a 'lady of condition' of hydrophobia. In the end of the seventeenth century a complaint was made against its use to the Presbytery of Glasgow; but the Presbytery, having made inquiry and discovered that the stone was merely cast into the water which the diseased cattle were given to drink, without the use of any incantation, and considering, to quote an extract from their minute-book, 'that in nature there are mony things seen to work strange effects, qrof no humane wit can give a reason, it having pleasit God to give unto stones and herbes special virtues for the healing of mony infirmities in man and beast, advises the bretheren to surcease their process, as q'rin they perceive no ground of offence;' and admonishes the said 'laird of Lie,' in the using of the said stone, 'to tak' heed that it be usit heirafter wt. the least scandal that possiblie maye bie.' One wishes all ecclesiastical authorities had been as wisely guided;

but when in later days one hears of a collection of stones and charms being made by order of a minister of the Free Kirk on the west coast, and taken out in a boat and cast into the deepest part of the loch, one sighs over the ignorance and bigotry that destroyed so much of antiquarian value. As the years go on less and less survives, the old 'wise people' die out, and their young 'wiser' descendants scorn their ancient lore.

Besides these foregoing 'named' charms there are many others—miscellaneous stones which were used as charms, water-worn pebbles of curious shapes and various sizes, amber and glass beads, flint arrow-heads, seeds, and many other objects which were regarded as full of virtue. The charm was used in various ways. Sometimes it was applied to the seat of the disease; at other times water from a south-running stream was procured, into which it was dipped, and over which an incantation was repeated before it was given to the patient to drink or was sprinkled over him. 'Clach Leighis' or 'Clach Buadhach' (Stone of Healing or Stone of Power) were names applied to these charms in the Highlands.

Jasper has always been regarded as a stone of curative virtue. It preserves from peril and makes its owner strong and victorious. A red jasper bead in the possession of the family of Campbell of Craiguish was a much-valued charm; it was used for the cure of murrain in cattle, and to ensure its virtues having full play must never be touched by the first finger of the right hand of the user.

Willox's Ball and Bridle, a famous charm in Speyside in the early part of the nineteenth century, is described as consisting of half a glass or pebble ball and a small brass hook, supposed to have been cut from the bridle of a water-kelpie. Its use was the same as that of the previous charm.

Elf-bolts were flint arrow-heads, and were supposed to be manufactured by the fairies to annoy mortals. Whoever had one in his possession was safe from their attacks—from malice, witchcraft, and the evil eye. Mare-stanes were used to prevent nightmare and evil dreams, and were hung in stables against witchcraft and as a preventive against horses being taken out and ridden at night by the hag called Mara.

The toad-stone was another curing-stone, the common belief as to its origin being that it was found in the head of a toad; but the true toad-stone is in reality the fossil tooth of an extinct species of fish. One which was used by the last of the Mearns witches in the eighteenth century is now preserved in the museum of the University of Glasgow. Serpent beads or stones—Clachan Nathrach—and snail-beads and adder-stones are all of the same class. The tradition is that they are formed by the creatures meeting together, when by kissing they evolve a kind of bubble, which eventually hardens and becomes a ring or bead, and this is sovereign for the healing of serpent-bites and other similar hurts. These beads are really glass, and their origin is probably not Celtic but from overseas; they may be of Egyptian or Phœnician workmanship. Amber beads were also considered of great virtue—'Lammer beads,' as they were called—and every woman who could wore a string of them round her neck; they drove off witches, protected from evil, and cured blindness. Among the Western Isles the seeds and nuts of certain West Indian plants carried over by the Gulf Stream are regarded as amulets, chiefly used by women at the birth of their children. *Airne Moire* (or Virgin Mary nut) is the local name.

People of 'common-sense' will be scornful of all these old-world beliefs and observances, but in these days of Christian Science and renewed belief in faith-healing and cures by suggestion, it may occur to us that possibly there is something of a kindred nature in the belief in the efficacy of these charms, and that when they were used therapeutically the personality of the healer had to do with the cure. Cures might be wrought by faith aided by the material help of large draughts of the spring-water which always seem to enter into the prescription.

A PAWN IN THE GAME.

CHAPTER XVIII.—CHANGES.

As a result of his Paris experiences, Jack Lawrence found himself all at once become of official importance. A halo of romance hung about him. He had seen close at hand the new and terrible forces that had suddenly broken loose and were filling Europe with dread. He was questioned and cross-questioned by one eminent official after another.

Lord Granville, the Secretary for Foreign Affairs, sent for him and heard his tale. Fox listened to his story with compressed lips and dreamy eyes. He was impatient of the mere details of the September massacres. Behind the wild scenes that, during those terrible days, the Abbaye and a dozen other prisons in Paris had witnessed he could discern the forces that produced them, and the political goal towards which they were hurrying France; and while he frowned at the immediate incidents of the bloody drama, he sympathised with the goal beyond them towards which the nation was blindly struggling.

Robert Lawrence, who, like many Englishmen of his time, was frightened out of his Whiggism into Conservative politics by the dreadful shapes the Revolution took, shook his head.

'What excuse is possible,' he asked, 'for the massacre of the prisoners? It is the Jacquerie once more; and this time the Jacquerie is in the seat of government itself.'

'It is the price France pays,' was Fox's answer, 'for deliverance. You can measure the weight of the oppression by the energy of the recoil.'

One morning, as he sat in his room, a message came to Jack that Mr Pitt wished to see him. That the Prime Minister should 'wish to see' a junior clerk in the Foreign Office was a very unusual circumstance, and Jack obeyed the call with some nervousness. Pitt sat alone in his room, and young Lawrence looked, with the respect the great commoner never failed to inspire, on the strong, half-melancholy face with deep lines of care ploughed on every feature, the eyes so steady and full, the hair brushed back from the great forehead, the firm lips with their downward, half-sad curve, the full rounded chin, the turned-up nose—'turned up at all mankind,' as one of his enemies said. Somehow Jack felt the great Prime Minister was a lonely figure; majestic perhaps, but solitary.

Pitt listened to the young fellow's story, and put a few brief questions that went to the heart of things. Jack was shrewd enough to realise how different was Pitt's point of view from that of Fox. To Pitt the French Revolution would have been an irrelevance if it had not been a disaster. He was nursing England back into strength from the tragedy of the war in which she lost both her colonies and her fame; and the French Revolution threatened fatally to arrest the healing process. All the economies dear to his financial genius, and all the great reforms which his sane and practical mind was planning, must go to wreck if the fire raging on the banks of the Seine spread to other lands.

Pitt's interest in Jack's story was that of a duellist anxious to learn the methods of his coming antagonist. Here were new and strange forces stirring the world's politics; and it was only too certain that he was on the verge of a conflict with them which would be titanic in scale. He wanted to measure them, to learn their direction, and assess their energy. How they might affect France did not greatly concern Pitt. He was an Englishman first and last; the sole question for him was how England would be affected.

Fox saw—dimly perhaps, and as though through some golden haze, but he *did* see—the far-off goal to which these events were hurrying France. Pitt's vision was of things that lay nearer. He discerned the struggle which the older nations must wage with revolutionary France, and what the struggle would cost.

Pitt presently fell into a muse, and Jack waited respectfully, trying to guess what thoughts were behind that strong and melancholy face. After a while Pitt roused himself.

'Mr Lawrence,' he said, 'your talk has interested me. You seem to have been lucky in Paris. If we send you there again I hope you will be as fortunate.'

There was a hint of promotion and of higher service in the words which set all Jack's nerves tingling.

During the weeks that followed there came in swift and almost breathless succession the shock of one great event in Paris after another. The Revolution was hastening to its climax. Europe at the end of the eighteenth century resembled nothing so much as a medieval building with dry rot in all its timbers, and the French Revolution was a fire suddenly breaking out at its heart and filling the whole building with its smoke and heat.

The newly born Convention had proclaimed France a Republic on September 21, while John was yet in Paris. Four weeks later it issued a decree promising help to all nations that 'desired to be free.' It was a proclamation of war against all existing Governments. In January the king was beheaded. France, in Danton's phrase, had flung down as its gage of battle to all the great Powers the head of a king. The revolutionary armies were everywhere triumphant. Belgium was annexed; the Scheldt was proclaimed open, and by that act a dozen treaties were cancelled. On February 1 war was declared against Great Britain.

Meanwhile Denise slowly crept back to health. But a sensitive and gentle-natured girl could not go through the wild experiences of the Abbaye and of the September massacres without being profoundly affected. In her slender figure was a courage so fine and high that the mere terrors through which she had passed left her nerves unshaken; but the scenes through which she had been hurried wrought in her a strange transfiguration. The very colour of her life seemed to be changed.

This French girl loved France with an unguessed depth of proud affection, and she was scorched with shame that France—her France—should offer herself to the gaze of the world as a drunken and ragged Mœnad. She forgot the dark centuries behind the Revolution which explained it, and she could not see the new life which was to emerge from it. Which of the wisest heads in Europe, indeed, remembered the one or could foresee the other? The goal which, by such a bloody path, France was to reach was for those who stood in the smoke and dust of the Revolution beyond their vision.

Poor Denise saw Paris, the Paris of the massacres, through the tender and innocent eyes of a girl, and she was as one scorched with shame. It was as though a stately and gallant ship had fallen into the hands of a band of pirates.

'*They* are not France,' she would say to Mrs Lawrence, 'the men who are doing such dreadful things.'

'My dear,' that good lady replied consolingly, 'they are not *you*, and that's very much more important.'

But this was small comfort to Denise, and each

day brought some new tidings from Paris which made the fire of shame in the poor girl's blood only more scorching. She seemed to feel each stroke of the guillotine as though it cut her own flesh.

'A French girl,' she told her aunt, 'had no business to be in the shelter of a happy English home while so many girls in France were passing through such scenes.'

In Mrs Lawrence's drawing-room one night a little group sat discussing Denise. Robert Lawrence, a hard-headed lawyer, could not understand her mood.

'It is morbid,' he said bluntly; 'her brain has been shaken by the scenes she passed through.'

'Her brain,' Mrs Lawrence protested indignantly, 'is as sound as yours or mine, and a great deal quicker;' and the indignation in Mrs Lawrence's voice made the group by the fireside laugh.

'There is a touch of Joan of Arc in that slender little body,' said Fox, who was one of the party, 'as there is in many Frenchwomen if you can only get down to it. Look how the fine ladies are going to the guillotine. Talk of the courage of soldiers in the battlefield! This is a finer thing.'

Meanwhile, to Mrs Robert Lawrence's outspoken indignation—who felt it to be a reproach to her housekeeping—the face of Denise grew thinner day after day. There were shadows under the shining eyes, lines on the girlish brow. She was restless; she longed to go back to Paris. She almost persuaded herself it was her duty to go back. If she could not help others, at least she could suffer with them.

To Jack, all these complex emotions gave a new and deeper charm to the face of Denise. There was a gravity on her brow, a fire and depth in her eyes, a strength in her tender lips, which made her seem to him as if she belonged to some finer and more spiritual order than himself. Denise and he were living on terms of closest comradeship. They were drifting, indeed, into still happier relationships, and Jack's life was being suffused with a new and strange charm.

It had been explained to Denise that in a small way she was an heiress, and was not living on charity.

'Both wills,' Jack said to his uncle, 'have been practically abandoned; but father certainly meant five thousand pounds to go to Denise. She will not take it as a charity, and the facts need not be explained to her too closely.'

So Robert Lawrence told briefly that her stepfather's will included a legacy to her of five thousand pounds. 'I will invest it for you, and then you will be independent; and as you are a proud little thing, this will suit you.'

Denise took it all without question, and with a wistful gratitude that was very touching.

'Father'—she always referred to the dead man as 'father'—'was the best of men;' and some wordless grief filled her eyes with tears. In the mystery of the elder Lawrence's wedded life lay, Denise knew, some dark secret that she could not guess, and the sense of it perplexed and distressed her.

Her aunt regarded the so-called 'legacy' with some doubts. It gave Denise a perilous independence. 'She will give it all,' the former said, with an impatient sniff, 'as she would give herself, to France.'

Meanwhile, Jack's love-making did not prosper. Did he, indeed, love Denise? he sometimes asked himself; but the self-proposed question was only asked for the sake of the overpowering wave of tenderness with which the challenge was instantly answered. But did Denise love him? On that subject Jack swung incessantly betwixt the opposite poles of hope and fear. She would look at him as he urged his love, and a softness crept into her deep eyes, a faint colour stole into her pale cheeks, which filled her lover's mind with unreasoning gladness. Denise, as a matter of fact, did not deny—if she did not confess—her love; but she would say, with a soft resolution which filled Jack with despair, 'I have no right to be happy. No French girl ought to be happy while these things are happening.'

Jack argued, with masculine logic, that to make an English lover unhappy for the wrong-doing of a number of people in France was only to increase unnecessarily the sum-total of human suffering. Denise would smile at her lover's energy, and perhaps put her slender, quivering hand in his with a gesture of shy tenderness. Then she would shake her head, and the purpose on her brow was immovable.

In January came the news of the execution of the king. Oddly enough, it left Denise comparatively unaffected. 'It was certain to happen,' she said, 'and it is the business of men to die.'

But there remained the unhappy queen and her children—the girl-princess and the little dauphin. These were in the Temple, and in such hands as Denise had seen with bloody pikes in the Abbaye; and the thought almost broke her heart. She was wroth with her own sex, which forbade her to do anything. She looked at Jack with eyes that seemed, he thought, to challenge him. Could nothing be done?

Jack was, as he frankly admitted to himself, not too willing to plunge once more into the hell-broth of Paris at that precise moment; but at the lightest whisper of Denise he was ready to start.

(To be continued.)

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART XI.

OF Thackeray I myself cannot even say '*vidi tantum*.' I find, however, the following reference to him in my father's *Reminiscences*:

'I got my first glimpse of Thackeray in Edinburgh somewhere about the year 1850. He was then at the height of his celebrity, and while he gave a course of readings of "The Four Georges" he was received with open arms and fêted to the top of his bent by all that remained of the once famous Edinburgh society. Lady Murray, the wife of the Scotch Judge of that name, was very fond of music, and they used to invite to their weekly parties all those who were musically or otherwise distinguished in Edinburgh. Owing to the fact that I was a fairish amateur on the violin I was lucky enough to have the *entrée* there, and it was at Lady Murray's that I first met the great novelist. He came after his reading, and remained to supper, at which, I remember, Lord Murray offered him "a little Hochheimer," adding, "What you in England cannot pronounce, and so you call it Hock." When the party was over I was in the hall with Thackeray, supplying him with a cigar, and on the point of opening the door for our departure, when we were stopped by the following grotesque incident. All the other guests had left before us. We heard whisperings on the landing above. Lord Murray, on hospitable thoughts intent, was evidently consulting his *cara sposa* before inviting the great man to dinner. Heavily old Lord Murray descended the stairs; but before he had got half-way down, or even opened his lips, Thackeray stopped him by exclaiming, "You are very good, my lord, but I am unfortunately engaged every day of my stay here." Then he opened the door, and we left a tableau of dear old Lord Murray speechless on the stairs, looking up at his wife.

'Many years afterwards I used to meet Thackeray in London at the Reform Club and at sundry dinners. He was fond of airing his German, and even went so far as to pun in quasi-German. "This is really vortrüfflich," I have heard him call out as he tasted a dish with truffles in it.

'We had many intimate friends in common, but it was never my good fortune to be on very intimate terms with Thackeray himself. He was to have dined with me on the day after he was taken ill, and his daughter, Mrs Richmond Ritchie, has told me that when she left him on the evening before he died the last words she ever heard him speak were, "Tell Lehmann." She has been good enough to give me one of his original sketches to bind up with the *édition de luxe* of his works.' It is a water-colour drawing of a very small girl holding in her arms a very large bundle, labelled 'Vanity Fair.'

My own place at the *Punch* table (the 'Mahogany Tree' which Thackeray celebrated in verse) is close by the spot on which he carved the monogram of his initials. The 'Mahogany,' I may add, is a poetic license. Deal would be nearer to the truth; but no deal that I ever heard of has been more highly honoured. Impressed with these great initials it may vaunt itself above all the mere mahoganies that ever were made into tables.

From Thackeray to Lord Houghton the transition is not difficult, for it was Lord Houghton who wrote the noble lines in which Thackeray's claim to a resting-place in Westminster Abbey was vindicated. I quote three stanzas:

O gentle Censor of our age!
Prime master of our ampler tongue!
Whose word of wit and generous page
Were never wroth except with wrong.

Fielding—without the manner's dross,
Scott—with a spirit's larger room,
What prelate deems thy grave his loss?
What Halifax erects thy tomb?

But, maybe, he who so could draw
The hidden great, the humble wise,
Yielding with them to God's good law,
Makes the Pantheon where he lies.

Poet, essayist, politician, and man of the world, the friend of all oppressed causes and of all persecuted men, Lord Houghton had warmed both hands before the fire of life. 'I am going over to the majority,' he said when he was very ill in the year before his death, 'and you know I have always preferred the minority.' I have given in the *Cornhill* my father's account of the way in which Sir Alexander Cockburn, the Lord Chief-Justice, attempted at a dinner-party to browbeat Lord Houghton, who had spoken in defence of the notorious Plaintiff at that time prosecuting his claim to the Tichborne estates. 'Suddenly,' writes my father, 'Cockburn cut him short by saying, "I should have thought this impossible from any one with the very meanest intellect." Houghton paused, apparently overwhelmed, and then replied, "But surely that was very rude;" upon which Cockburn, glaring fixedly at him, merely added, "I meant it to be so." I think it was Lord Houghton who, in allusion to this incident, said that nobody ought to invite Cockburn to dinner without having a fire-engine at hand. There is a reference to the Plaintiff in the following letter written by Lord Houghton to my mother:*

* I have to thank the Earl of Crewe for permission to publish here the three letters from his father, Lord Houghton.

'FRYSTON HALL, FERRYBRIDGE, *March 7th*, 1872.

'MY DEAR MRS LEHMANN,—Lady Houghton has handed me your most kind note, and it reminded me of my neglect (just before I fell ill) of the charming one you sent me out of the pleasant-peopled hills of West Scotland. Ever since that time I have been more or less poorly—at one time quite laid up, and only now recovering. I tried London for a few days, but found I was not up either to its work or play. So we do not come up till after Easter. But in the meantime—that is, in the Easter holidays—won't you and Mr Lehmann and the fair Nina be persuaded to pay us a visit here? We are not very far from Woodlands [near Highgate] when you once come down from your garden into the railway, from which I always think I see it as we enter London. Would you object to meeting the injured and, alas! unrecognised Plaintiff?—I am yours and Mr Lehmann's very truly, HOUGHTON.'

My own most vivid recollection of Lord Houghton springs from the time when he paid us a visit at Dunnichen in Forfarshire. Mrs Procter was with us on the same occasion, and where these conversational protagonists had polished their arms dullness could not exist. During the day, while we were attempting to secure partridges, Lord Houghton used to drive about the country or saunter in the garden. After dinner, when the ladies had departed to their beds, he arrayed himself in a voluminous smoking-gown and a red fez, and joined us in the smoking-room, where he kept us all alive with anecdotes and stories drawn from the great storehouse of his experience. One evening, I well remember, he played an active and brilliant part in helping us to organise and carry through a series of 'dumb crambo' performances. After his visit he wrote to my father:

'TILLYFOURIE, ABERDEEN, *Sept.* 21, 1882.

'MY DEAR LEHMANN,—I managed my little journey very well, and crept up here in the gloaming without catching cold.

'I find that some Americans I had been asked to meet had just gone off—the Hays, whom I had known in the States, and a Mr Clarence King they talk much of. Who did you tell me wrote *Vice Versâ*? They say here the writer only got £10 for it. Did not Mr Payn * tell you another story? If you have Mr Payn's note with its kind message to me in it, will you let me have it as an autograph?—With kind regards to your pleasant social group, who were very good to me, I remain, yours very truly, HOUGHTON.'

In the next letter Lord Houghton refers to his portrait painted by my father's brother:

'FRYSTON HALL, FERRYBRIDGE.

'MY DEAR MRS LEHMANN,—Will you give me a line saying how long you stay in Hampshire? I shall be going westward some time in this month or early in the next, and shall be very glad to spend a day or two with you *en route*. My picture by Mr Lehmann is said to be a great success. At least he thinks so himself, and I myself as an Artist know when my poetry is at its best.—I am, yours and Lehmann's, very truly, HOUGHTON.'

I cannot remember whether the suggested visit took place or not.

LORD LYTTON.

My father was made known to Bulwer Lytton by Charles Dickens, and was soon afterwards asked to pay a visit to Knebworth. I have before me as I write the formal note in which 'Sir E. B. Lytton presents his compliments to Mr Lehmann, and begs to express the sincere pleasure it will afford him if Mr Lehmann will accompany Mrs Benzon and Miss Griffith in the visit to Knebworth with which they have promised to honour him next Saturday. Sir E. hopes it may suit Mr Lehmann's engagements to remain till Tuesday.' The date attached to this is 'Saturday evening,' which must have been 4th May 1861. There is in the third volume of Dickens's *Letters* a letter to Bulwer Lytton, dated Wednesday, 8th May 1861, in which Dickens expresses himself as 'anxious to let you know that Mr Frederic Lehmann, who is coming down to Knebworth to see you (with his sister, Mrs Benzon), is a particular friend of mine, for whom I have a very high and warm regard.' Miss Griffith, who is mentioned in Sir Edward's note, was an American lady, a poetess who had dedicated a little volume to Sir Edward.

The visit duly took place, and my father thus describes his first impressions in a letter to my mother:

'KNEBWORTH, *Sunday, 12th May* 1861, 11 A.M.

'Just a line from this enchanted castle. The post leaves at 12, so there is not time for much. It is a wonderful place—a perfect Old Curiosity Shop. Everything that Wardour Street ever had in it for the last three centuries has found its way to Knebworth. Sir Edward received us at his own door. I always fancied I had seen him before, but I was wrong. His face in repose has hard, fierce lines all over it, but when he speaks and makes himself agreeable to you that impression vanishes. I repeat, the place is wonderful. There is enough of old leather, carved wood, tapestries, silk hangings, old armour, and stained glass to make an antiquarian mad with envy. The dining-room is a gorgeous banqueting-hall the whole height of the house, with a gallery at one end. There are banners, devices, a blaze of plate, and, I am sorry to add, an Arctic climate in spite of an enormous fire, to which Sir Edward drew his chair immediately after dinner and began to smoke. I did the same, and this liberty makes you feel at your ease at once. The drawing-room is a fine long gallery full of the most interesting portraits, about every one of which he has some story which he tells *con*

* The late James Payn the novelist, at this time editor of the *Cornhill* and 'reader' to Messrs Smith, Elder, & Co.

gusto. The library I only had a peep at. If our bibliomaniac E—— had had that peep his peace of mind would have been gone for ever. The weather is terrible, and we have not been out of the house yet, but there is so much to see that no one can feel dull for an instant. My room is called the Hampden Chamber, and the paper consists of stripes of griffins alternating with the Lytton motto, "*Hoc Virtutis Opus*." I wish I could draw it for you. It would drive one mad in an illness. We breakfasted at 9.30. Sir Edward has not yet appeared.'

'I well remember Lytton,' writes my father in another passage of his *Reminiscences*, 'expatiating on Disraeli's unbounded ambition. "But surely," I remarked, "he must be satisfied with being Chancellor of the Exchequer and leader of the House of Commons." "You mark my words," replied Lytton, "nothing will satisfy him until he is Prime Minister and an Earl." This was said in 1867 or 1868. I may here relate a curious conversation which took place in my presence at Knebworth in 1866. Disraeli had brought the Tories into power for the second time, but the Cabinet was not yet formed. All the Knebworth guests were on the lawn near the house when some one asked Sir Edward, "And, pray, Sir Edward, which portfolio do you expect to take?" to which he replied, "One always likes to return to familiar places; and as I have had the Colonies [under Lord Derby in 1858–59], I presume I shall go back to the Colonies." In the afternoon we all went up to town and discovered that Bulwer had been left out in the cold. Shortly afterwards the usual consolation of a peerage was applied and accepted. His increasing deafness, which made him useless in debate, was doubtless the reason for his exclusion, which, in view of Disraeli's staunch and loyal constancy to his friends, was probably as painful to him as it was to Lytton. The sudden election of Lytton's son to the Viceroyalty of India was brought about, perhaps, in some measure by Disraeli's consciousness that something was due from him to the memory of his old friend.'

CHARLES READE.

I wish I could have spoken at greater length than my recollection and my materials make possible of Charles Reade, that great-hearted, chivalrous, erratic genius. He was for many years the friend of my parents; but during that time I was for the most part away at school or college, and my own memory of him is but a dim one. Even to have known and to have shaken by the hand the man who wrote that glorious and tremendous description of the Indiaman's fight with the two pirate ships is in any case no small privilege. Where in fiction can that passage be matched? To find its peer you must go, I think, to Napier's deathless account of the battle of Albuera. The spirit and temper of the two pieces are the same. There must, indeed, have been in Charles Reade's mind an unconscious remembrance of Napier's words. Let me give a short extract from each:

(1) *Napier: The Battle of Albuera.*

'Such a gallant line, issuing from the midst of the smoke, and rapidly separating itself from the confused and broken multitude, startled the enemy's masses, which were increasing and pressing onwards as to an assured victory; they wavered, hesitated, and then, vomiting forth a storm of fire, hastily endeavoured to enlarge their front, while a fearful discharge from all their artillery whistled through the British ranks. Myers was killed; Cole and the three colonels, Ellis, Blakeney, and Hawkshawe, fell wounded; and the fusileer battalions, struck by the iron tempest, reeled and staggered like sinking ships; but, suddenly and sternly recovering, they closed on their terrible enemies, and then was seen with what a strength and majesty the British soldier fights. . . . Nothing could stop that astonishing infantry. No sudden burst of undisciplined valour, no nervous enthusiasm weakened the stability of their order; their flashing eyes were bent on the dark columns in their front, their measured tread shook the ground, their dreadful volleys swept away the head of every formation, their deafening shout overpowered the dissonant cries that broke from all parts of the tumultuous crowd, as slowly and with a horrid carnage it was pushed by the incessant vigour of the attack to the farthest edge of the hill.'

(2) *Charles Reade*: '*Hard Cash*.'

'The pirate crew had stopped the leak and cut away and unshipped the broken foremast, and were stepping a new one, when they saw the huge ship bearing down in full sail. Nothing easier than to slip out of her way could they get the foresail to draw; but the time was short, the deadly intention manifest, the coming destruction swift. After that solemn silence came a storm of cries and curses as their seamen went to work to fit the yard and raise the sail, while their fighting men seized their matchlocks and trained the guns. They were well commanded by an heroic, able villain. Astern, the consort thundered; but the *Agra's* response was a dead silence more awful than broadsides. For then was seen with what majesty the enduring Anglo-Saxon fights. One of that indomitable race on the gangway, one at the foremast, two at the wheel conned and steered the great ship down on a hundred matchlocks and a grinning broadside just as they would have conned and steered her into a British harbour. . . . Crash! the Indiaman's cutwater in thick smoke beat in the schooner's broadside; down went her masts to leeward like fishing-rods whipping the water; there was a horrible shrieking yell; wild forms leaped off on the *Agra*, and were hacked to pieces almost ere they reached the deck; a surge, a chasm in the sea filled with an instant rush of engulfing waves, a long, awful, grating, grinding noise, never to be forgotten

in this world all along under the ship's keel, and the fearful, majestic monster passed on over the blank she had made,' &c.

I possess but half-a-dozen of the novelist's letters. In one, presumably written in 1866, he asks my father if he could 'send a hundred respectable workmen to the pit and amphitheatre of the Queen's Theatre early next week. It would, I think,' he continues, 'gratify the sons of toil, and also answer my purpose by giving publicity to my play in the City.' How my father, then head of a large mercantile firm in the City, was to procure the workmen, or how the workmen, if procured, were to advertise the play 'in the City,' was not stated.

In a later letter he fulminates to my mother against servants. 'The servants,' he writes, 'make all this mischief by pretending they will say who called and not doing it. If they would only say honestly, "No, sir, I will not tell missus you called. Why don't you bring a card like other people?" how much misery might be spared.' Only a genius (who, by the way, had also been Vice-President of an Oxford College) could ever have imagined that a servant would remember a casual caller.

JAMES PAYN.

And now I come to James Payn, a name to be held in grateful remembrance by many readers, and not least by those of *Chambers's Journal*, which he edited from 1859 to 1874, first in Edinburgh and then in London. He was my father's close friend and companion through many years, and to me too, from boyhood up, he was, in spite of the difference in our ages, a friend beloved beyond most others. I never knew a man more genuinely affectionate and sincere or more free from every trace of affectation. In his society one could think of mean things only to despise them, and of pompous people only to laugh at them. And as to laughter, those who once heard Payn's could never forget it. The whole cheerful soul of the man went to make it up. It was the most joyous, overwhelming volume of sound I ever listened to, sent up in a great full stream from the very fountain of mirth. His friends were permitted to chaff him about it; but once, when the late Bernal Osborne ventured to comment upon it, he did not escape scot-free. 'That man,' said Osborne, 'laughs like a cannibal.' Like a flash came the retort, 'At any rate, Mr Osborne, I've never been able to swallow *you*.'

In 1869 my father took my younger brother and myself to the Lake District, and Payn accompanied us. He had on hand the writing of a descriptive book, afterwards published, under the title of *The Lakes in Sunshine*. One incident of this tour remains vivid in my memory. Payn had been vaunting the merits of Professor Stokes's system of mnemonics, which, so he said, had enabled a young woman he knew to accomplish the otherwise impossible task of reciting Southey's 'Falls of Lodore' by heart. My father thereupon backed me (I was then not quite fourteen years old) to learn the poem and to recite it at the same hour on the following day without any adventitious aid. A sovereign was the amount of the bet, and I was promised the possession of it if I succeeded. No single omission or misplacement of a word was to be allowed. The task is one that I would not undertake for ten times the amount nowadays, for there is no necessary connection of any kind between one line and another throughout the poem. In those days, however, I was enterprising, and my memory was a quick worker. I duly performed the task and received the reward. Payn tells the story in his own more or less decorative way in *The Lakes in Sunshine*. Being in danger, he says, of being used as a hare by us in a game of hare and hounds, he bought himself off by offering us five shillings apiece—on condition that we learnt the poem by heart. 'Their countenances, which had gleamed with rapacity, fell almost to the depth of the cataract in question when I annexed the condition; but they both said very good-humouredly that they would try their best.' On a later page he reports that 'Gatty (*enfant gâté*), having much time on his hands and nothing to do with it, absolutely learnt that poem and recited it without flaw.' The last few words are accurate.

Payn was certainly the very best company in the world, for, though he never monopolised the talk, his brilliant humour and the unceasing flow of his animal spirits always secured for him a leading part and helped him to bring out all that was vivacious in his companions. His wit and his laughter radiated so generously on those who sat with him that he gave each of them the feeling of having been lifted into a clearer, brighter atmosphere where everybody enjoyed the privilege of being witty without being malicious. Suffused with the delightful glow of his personality and sped along by the swift succession of his stories, the evening passed all too quickly till the time for parting came, and nothing was left but to make plans for a prompt reunion. I wish I could summon all those evenings back and live them over again!

I have only a few letters written by Payn in the amazing hieroglyphics (more puzzling even than those of Lord Houghton and Lord Lytton) which distracted his friends and his printers. When my father died in 1891 I handed back a large packet of letters he had received from Payn. One, however, I kept, and I shall print it here. My first is a letter* from Payn to me giving me advice as to the choice of a college. I was destined for Trinity, Cambridge, but had shown an inclination to try for a scholarship at some smaller college there or at Oxford. Payn was the most loyal of Cambridge men; but Cambridge to him was summed up in Trinity, and he scouted the idea that any one could

* I have Mrs Payn's permission to publish these letters here.

want to go to another college. 'I don't say,' he wrote, 'as the Trinity man said when defending the small college men, "Let us remember that they too are God's creatures;" but such a supercilious remark could never have been made unless there had been *some* reason for it. I speak of what I know in this case, whereas in my preference for Cambridge over Oxford I may be swayed by a natural prejudice without knowledge. . . . This, however, is certain, that it would be better for you to be a simple undergraduate at T.C.C. than a scholar at a small college; but with application you ought to be a scholar at Trinity. Then I'll come down and dine with you.' I failed to secure the scholarship, but he came all the same.

The next letter shows him in his character of amiable and encouraging critic. I had been writing verse, and had sent him some specimens. There is no date to the letter, but it must have been written towards the end of 1876:

'15 Waterloo Place, S.W.

'My dear Boy,—The poem is very nice—I mean really nice—but not so good as "The Dolomites." The last line is a metaphor drawn from the subject, which is contrary to the canons. Still, it is good. Why do you want to attempt the *Cornhill?* I happen to know that *Chambers's Journal* is in want of good verse. If you do not want to send a few specimens to your Uncle Robert I will send them for you. There! Love to Fred.—Yours ever,

'James Payn.'

This is the one letter to my father that remains to me. It was written to him when he was within a fortnight of his death:

'"The Cornhill Magazine," *Aug. 8th*, 1891.

'My dear Old Friend,—Martin has just been here. What he has told me of your poor self wrings my heart, as it will wring my wife's heart. She often talks of you, and always with the deepest sympathy.

'If anything can help one in your sad condition it should be the knowledge that there are two persons in the world (outside your own people) whose memory holds nothing concerning you save your many acts of kindness to them.

'God bless you, dear old friend! When I think of the days we once had together my eyes are wet. —Yours *ever* affectionately, James Payn.'

My last letter from Payn is dated April 29th, 1895, when he was very ill and confined to his house. It is written in pencil:

'My dear Boy,—Your kind letter touched me very much. How well I remember, alas! the scenes of which you speak. We have heard the chimes not only at midnight, but at all hours. You have sent me enough asparagus to set up a shop with. It is very good of you to have remembered my little weakness—the only one in an otherwise blameless life.—Yours affectionately,

'James Payn.

'Do not come on Tuesdays or Fridays.'

The prohibition in the last sentence may be explained by a quotation from the charming little memoir prefixed by Leslie Stephen to *The Backwater of Life*, a posthumous volume of Payn's essays: 'When physical infirmities made it impossible for him to frequent his old haunts, the whist club to which he belonged made an arrangement which it is pleasant to remember. Four members went by rotation to his house in Warrington Crescent, Maida Vale, twice every week to give him the pleasure of a rubber. Few men, I fancy, have received such a proof of the kindly regard of their friends. I am as incapable of playing whist as of writing a novel; but to me, as to many others, it was an act of self-indulgence to spend one of the other afternoons at Payn's house.' I am thankful to remember that I was able to be one of the 'many others.'

A CHANGE OF FEELING.

PART II.

THE silence was broken. Another sheet of flame lit up the façade of the houses opposite, but this time the rifles had another mark. The front of the palace became pitted with dark patches; a veritable hail of bullets hissed and seethed through the ranks of the Guards.

The volley was replied to by one from the houses on the palace side of the square, and then the fight grew hot. No man dared show himself in the open and live; he was picked off from one side or the other with unerring accuracy. Hazlitt was watching the colonel. He saw that the nervous hand at the moustache was still mechanically stroking the hair; he saw the grim smile on his set lips; and then, as he watched, he noticed that the motions of that long, brown hand became more deliberate, he saw a cruel gleam in the brooding eyes; then the officer reeled slightly, opened his mouth with a queer gasp, and fell inertly to the ground. He had been shot through the heart!

Castries gave a grunt as he dragged Hazlitt down beside him.

'No use sharing his fate,' he muttered. 'He was a brave man, but foolhardy, that colonel. *Caramba*, but I will have revenge for his death!' The slow anger that had been brooding in his heart was come to a culmination now; he was no longer the loving President; he was the stern, merciless soldier under

temporary defeat. He whispered to an orderly who crouched beside him, and the man crept away under cover of the wall. Soon the shrill notes of a bugle were added to the clamour; then the tramp of horses rang under the arch of the palace *patio*. Castries beckoned to Hazlitt, and the two men crept away.

The cavalrymen numbered some hundred and fifty, as they mustered silently in the great courtyard. A magnificent black horse stood ready saddled, its furnishings bearing the arms of the Republic. The President leaped to the saddle, and harangued his men with fierce, martial words. He pointed out to them that their fellows over the way had been slaughtered like rats in a trap; he mentioned the fact that their colonel was lying shot through the heart in the narrow garden; he told them that Fromania looked to her sons to make all that good. The silent, swarthy troopers answered with a vindictive yell, and the ponderous gates were flung back.

Under cover of the fire from the captured houses, the revolutionists were advancing rapidly across the *plaza*. They were mad with the lust of blood, for those few minutes in the houses had spelt death to many. As they came on, volleying curses and bullets together, they presented an aspect that would have terrified any but the bravest hearts. At their head, in full view of all, rode a stalwart man, from whose shako hung the white plumes of a general.

'It is Marconeza,' muttered the President.

Hazlitt covered him with his revolver, but his hand was arrested by Castries.

'He has said things about me—and about others. Leave him to me, my friend.' The Englishman nodded, and sent the shot into the midst of the yelling mob. A volley from the houses played sad havoc with the little troop, and they fidgeted under the restraint. Gradually the far side of the square was densely packed with men, the fire from the covering windows died away, and then, with a full-throated roar, the insurgents advanced against the palace.

'Now!' said Castries sharply, as he drew his sword. 'No quarter!'

The troop was in amongst the mob in an instant. They gave a little cheer as they felt that the time for action had come; but the cheer died away into the stern silence of desperate men.

Hazlitt and the President rode knee to knee. The steady sweep of their swords was like a mower's scythe. Where the keen steel bit no man rose again, and ever they fought their steady way to the spot where the white plume flashed.

Against the charge of those mounted men the foot fell steadily back. But the insurgents were soldiers too, drilled in the same school as their opponents, and the retreat was not a rout by any means. The rifle-fire from the houses had stopped by this time. No man dared fire, for he was as liable to hit a friend as a foe. But the men who had captured the houses slowly issued forth into the *plaza* and added their numbers to the revolutionists. There was a sudden check in the retreat; a sharp volley of musketry broke from the front of the packed mass; men fell by the dozen. Riderless horses were now galloping about the *plaza*; little piles of men marred the whiteness of the pavements; blood ran freely along the gutters.

Dear to the heart of a woman is the first cry of her child; dear to the writer is the sight of the trim binding of his new book; but dearer than all else is the joy of a charge to your true cavalryman. Hazlitt was doing splendid work. The sweep of his unerring blade never faltered, the strong arm never tired during the whole of that wild, mad ride, and the swarthy Fromanian renegades shrank fearfully from his meteor-like path.

General Marconeza was harshly ordering his men to advance and wipe out the opposition, when a sword was lightly laid on his arm. He turned his averted eyes, and a gleam of hate and fear crept into their sinister depths.

'To the death, General,' said the President simply, and fell to work. There was a pause in the fray then, while the two leaders met in the medley of death. No shot was fired; no sound was heard save for the silvery ring of the blades and an occasional grunt from the one side or the other as a shrewd blow was harmlessly turned aside. Victory appeared to be with the President—he had already wounded his opponent severely in the shoulder—when, with a ringing clearness that curdled the blood of many, a single shot echoed out.

Castries wavered in his onslaught, his raised hand fell inertly to his side, he rocked wildly in the saddle for a moment, and then Hazlitt was off his horse and on his knees by the side of the dying man. He had been foully shot—as treacherous a deed as even Fromania could be ashamed of.

Then the struggle went on. Men rode fiercely at Hazlitt and his charge, but a little party of stalwarts circled the pair and held off the would-be assassins.

Hazlitt bent lower as some faint words came to his ears.

'You will remember—your oath, my friend? Jacinta—must—not'——

'I know—I promise,' said Hazlitt in an agony. He could hardly bear to see the look of anguish in the dimming eyes. 'She shall not'——

'Then all is well. But—it—was—not—*buena guerra*, señor; I—I—should have killed—that—Marconeza.'

Then the faint voice died away. There was a strange gurgle in the President's throat; his eyes closed. Suddenly he sprang almost erect, and dragged his sword up to a feeble salute. 'Fromania!' he cried; and then again, 'Jacinta!'

And Hazlitt, as he lifted the heavy body to his saddle, knew that the Jacinta he meant was not the girl who waited in the palace, but that other Jacinta—his English wife with the Spanish name; and he

knew, too, that Juan Castries had found the joy of his life.

With the body across his saddle-bow, with his eyes gleaming fire, the Englishman spurred forward, intent on avenging that cowardly shot. But a quickening roar, a roar with a note of exultation in its depths, gave him pause, and he looked about him. The situation was too desperate. The sorely diminished troop of men was slowly falling back, stubbornly contesting the ground, but surely retreating. One by one the men fell from the saddle; and Hazlitt, thinking of his vow, saw that no time was to be lost. The trumpeter was at his elbow, a keen-faced little man who knew no fear. There was not a single officer left alive amongst the loyalists.

'Sound the retreat!' cried Hazlitt for the first time in his life, and his blood boiled at the thought. But it was so necessary that no one could say it was the word of a coward. The clear notes rang over the tumult; a hoarse cry of joy rang out ahead; the troopers sullenly fell back still farther, until they made a final rally at the very gates of the palace. Then a sharp volley rang out over their heads—the few men who were left in the loyal houses checked the oncoming insurgents for an instant; the great gates clanged open, a hot and blood-stained crowd of men pressed through, and the iron door fell to with a sullen clang.

Once they were in that peaceful courtyard the outer strife seemed to be part of some unreal nightmare. The peace of the place, as it lay under the silvery moon, was like a soothing hand on Hazlitt's reeling brain; it calmed the mad thoughts; it lulled his angry soul. The men were looking expectantly in his direction; it was evident they trusted to him to lead them for the future. He spoke hastily in broken Spanish that would have been ludicrous but for its earnestness.

'A check so far, *amigos*,' he cried huskily. 'We have a little more work to do yet.' He ran his eye rapidly over the group, and his glance kindled.

'One hundred men left. We can do much with that number. We shall tell the President we did our best, eh?' He indicated the limp figure in his arms, and then took off his hat. A hoarse cheer came from the wearied veterans; but they hushed their voices with one accord as their new leader dismounted and took his dead friend in his arms. Outside the solid gates the maddened crowds were swaying hither and thither; bullets were spattering like rain on the stout defence; the cries of the blood-maddened populace rose with a sinister shriek. The Englishman thought of the future and shuddered, brave man though he was.

He mounted the broad staircase and laid his burden down on a delicately upholstered settee. The dark blood slowly oozed over the dainty silk, but he never heeded the desecration as he strode on to the farther room. Jacinta was at the window; her face was white as death, but her eyes never faltered.

'You need not tell me,' she said, as he would have spoken. 'I saw it all. He died bravely, my friend; and I am his daughter. Why should I grieve? He has got his heart's desire.'

'Then,' said Hazlitt slowly—he was wondering at her courage—'then we have only to make ready for the end. I made a promise to your—to your—to him; it was about you.'

'I know,' she retorted proudly. 'I am not afraid. But the time is not ripe yet.'

'Their leaders are all dead,' said he, indicating the troopers below by a gesture. 'They will not follow me; I am not of their blood. I am sorry.'

Jacinta looked once at his face; but he was thinking of his duty, and somehow he could not see clearly. Otherwise he might have felt a strange surprise. Her eyes were blazing, but it was not only with courage. She thought of how she had seen him drop from his saddle, in spite of the threatening crowd, to receive her father's dying words. He was a man, she thought—a man that a girl might—— But here she caught her breath sharply. Her father not dead an hour, and she was already——

'Follow me, señor!' she cried impetuously, and rushed down the stair, hardly casting a glance at the prostrate form outside the door.

'Men of Fromania,' she cried to the listless men below, 'there is work to be done! The English señor will lead you to victory yet. You will follow him. Is it not so?'

Somehow there seemed a sad lack of enthusiasm in the reply. It was different a little while before—before their wounds had had time to stiffen; and the shouts of that furious mob sounded terribly menacing. Only a few—a very few—voices took up the answer. The memory of their dead President was too harassing for more.

The girl ran lightly back to the head of the stair. Her father's stiffening hand still clutched the good sword that had wrought much havoc in the revolutionary ranks, but she loosened the poor fingers from their grasp with a tender reverence. Then, with the sword in her little hand, she ran back. A riderless horse was in the *patio;* it had followed its fellows, as chargers will. Without a helping hand the girl sprang to the saddle and waved the sword.

'Open the gates!' she cried loudly. 'I go to avenge my father!'

There was something in the determined attitude of the child—she was little more—that appealed to the wavering men. Your South American dearly loves a dramatic situation—it is the salt of life to him—and the sight of this dauntless champion of the right moved them to enthusiasm. Hazlitt said nothing. If the end was to come it might as well come this way as any other, he thought. He could do that—that work—as well in the *plaza* as in the palace. So he looked to his girths, examined the edge of his sword, and then spurred up to Jacinta's side. There was both reverence and admiration in the salute he gave her; he felt his very soul on fire

with love for the brave girl who could move the hearts of those faltering men. But he said nothing. He wanted all his breath for what was coming.

There was a shout of laughter from the mob as the little forlorn hope rode out into the gathering dawn. The short night was dying in the arms of the new day, and the *plaza* was revealed in all its ominous details. But the laughter died in incredulous shouts as the men followed the girl. Once more the battle closed, once more the red swords flashed and fell, and ever at her bridle-hand rode Hazlitt, taking no heed to himself, thinking only of the girl he loved. He turned aside the blows that were levelled at her bare head; he fought like a man possessed. Gradually the little party mowed its deadly way to the centre of the crowd; though they were decimated they never faltered now, for the girl's clear voice rang high above the sounds of strife, and her sword pointed like a beacon-flame.

General Marconeza rode towards her through the throng with a sinister smile on his lips.

'Another of the accursed breed!' he cried aloud; 'but it is the last!' And he aimed a swinging blow at the defenceless head. But the coward's sword met sterner steel than that in a woman's grasp. It fell on Hazlitt's guarding blade, and the General's arm tingled to the shoulder. There was a fierce glee in the Englishman's heart as he felt the ring of steel on steel. It was the moment he had been longing for ever since his friend had fallen. He was going to do a man's part now. All the rest had been child's-play.

After five seconds of sword-play Hazlitt's blow fell home. It took his adversary where the shoulder rises into the neck, and the General spoke no further word. He fell from his saddle with a curse still on his lips, and his body was trampled under the advancing feet of the horses.

There was a sudden check in the revolutionary ranks. The man who had promised them so much was down, and the despised offspring of a despised ruler was victorious over his corpse. Fickle with the fickleness that is a part of their character, the Fromanians wavered, and as the charge was pressed home, broke and fled in ignominy.

A few scattered shots followed them down the streets, but the victors were too worn to pursue; they slid from their panting horses, and sat listlessly on the ground. Hazlitt silently took the girl's bridle—she was almost fainting now that the reaction was setting in—and led her back to the palace.

Neither of them spoke as Hazlitt lifted her from her horse and half-carried her up the staircase. He screened her eyes with his shoulder from the still form that was on the settee, and guided her like a blind child to the apartment where he had first seen her. A sob rose from her pale lips as she sank to a seat, and he rang loudly and persistently until an attendant came. Then he sat himself down to wait. There was much to be discussed.

The crimson hues of the full dawn filtered in through the unshuttered windows, and showed the starred mirrors, the shot-pierced pictures, the draggled hangings in all their glaring nakedness. It was a sad scene that was to meet the eyes of the woman he loved when she wakened to full consciousness, and Hazlitt moved towards the windows, intending to shut out the glare of the day. A sound that had risen to his ears before came upwards. A loud-voiced mob was streaming again through the *plaza*, where the less wearied of the soldiers were removing the traces of that sanguinary conflict. He shut his lips tightly. If they had found a new leader and were advancing to the attack again, he thought, they should still find one strong arm to guard that lovely woman from their hands. But there was a new note in the roar, a sound that was pregnant with joy. Even the soldiers at their work made no effort to run for shelter; instead, they joined up with the mob. Surging, panting, cheering, the men of Fromania gathered in front of the palace, and then, to the lead of a stentorian voice, they cried, '*Viv' el Presidente! el Presidente del Fromania!*'

Hazlitt paused wonderingly, the shutter still in his hand. He knew enough of the quicksilver impulses of the people to judge that they had set up some new idol, but his imagination failed him when he came to ask 'Whom?' He turned with a start as a gentle hand was laid on his arm.

Jacinta was standing tremulously beside him, her sweet lips quivering with weakness and pain.

'What do they mean?' he asked hurriedly. 'Stay!' as she would have advanced to the balcony; 'they are your father's murderers.'

'They are my father's people,' she cried proudly. 'He trusted them; it was Marconeza who turned them against him, and he is dead.'

She stepped out upon the balcony, and the cheering crowd went well-nigh mad. They had forgotten that awful *débâcle* of a few hours before—forgotten all save their allegiance to a conquering hand.

Round on round of cheers echoed up, but still there was a note of dissatisfaction apparent.

'*El Presidente!*' they screamed, and the voices rose to such a pitch of passionate frenzy that Hazlitt, fearing for the girl, stepped to her side.

That was what they wanted. As the tall figure appeared the very walls of the palace seemed to shake with the clamour; it rose up like a solid mass and struck the listeners in the face.

'They want me for President!' gasped Hazlitt in a wondering voice. 'Me! Why, I'm an Englishman, and not of their blood! What ties have I to bind me to them?'

The cheering died away; the crowd was waiting breathlessly for his words. He made no motion to address them; he looked only at Jacinta.

'I have no ties with them,' he repeated. 'They would be sick of me in a week.'

'They are my father's people,' she said softly; 'they require a strong hand. Can you not save them from further horrors?'

'But I am not of them,' he said again. 'There is no way out of that.'

She was looking at him, and the snow-white of her forehead slowly mantled with crimson. Then her eyes dropped to the ground; her lips curved seductively into a wonderfully tender smile.

'There is a way,' she whispered faintly, aghast at her own unmaidenliness. She was quite right, she said to herself, with a queer throbbing beneath her bodice; she was more than right. Was it not for Fromania, well-beloved of her?

Then understanding came to the soul of Hazlitt, and he took her in his arms in sight of all the vociferous populace that welcomed the action with that peculiar sanction belonging by right to the Latin race.

'*Is* it for Fromania?' he asked very gently.

'Yes—ah, *no!*' she whispered, her entire heart going out in the cry at last. 'No, not for Fromania alone—for you!'

To Hazlitt the cheering voices below sounded like a welcome to a new life.

PITCAIRN ISLAND AND ITS PEOPLE.

By Byron T. Prideaux.

IN the month of July of last year the writer had an opportunity of spending a few days at the little island away in the Pacific in which some of the descendants of the *Bounty* mutineers still find a home.

It is a matter of common knowledge that if a number of people live in a place cut off from their fellow-men they and their descendants develop certain characteristics, either physical or mental, or both. The causes of this are various—such as the climate, the situation and physical conditions of the place, the mode of life pursued, and the more or less isolation from the world. It is only to be expected, therefore, that a community like that at Pitcairn should possess some characteristics which mark them out from the rest of their fellow-men. The founding of the settlement by the English mutineers with their Tahitian wives, the subsequent history of the island—in which, owing largely to the early influence of John Adams, a deep religious feeling has always been in evidence—the absence of communication with the external world, and the intermarriages between the limited number of families, these things alone were sufficient to develop in the islanders mental and physical peculiarities to a marked degree.

There are at the present time one hundred and fifty-eight souls in Pitcairn Island. Physically, they are a very healthy people. The men are generally of the average height, well built, and muscular, while the women are extremely robust. Both men and women move about their rugged island with the greatest ease, the steep paths having developed in them the Highlander's capacity for climbing.

The island itself is a tropical paradise, abounding in fruit and vegetables. There are, however, only a few species of animals—namely, pigs, goats, fowls, cats, and dogs, and there are not many of the two first named.

With such a genial climate and such a bountiful supply of nature's gifts, the islanders naturally do not lead a hard life. Not that they spend their time in idleness, however; for, in addition to providing for the wants of his family, each man is called upon whenever necessary to devote a portion of his time to working for the benefit of the community in carrying out any public works that may be considered desirable by the chief magistrate and council.

They are a sincerely religious people, belonging to the Seventh-Day Adventist Church, to whose principles they were converted about twenty years ago. Previously to that they had followed the Church of England. On five days of the week secular school is held, attendance at which is compulsory up to a certain age.

The government is carried out by the chief magistrate, aided by two bodies, an External and an Internal Committee. All the officials are elected annually, and no salaries are attached to their offices.

The facts mentioned above are stated for the purpose of showing the reader that the little colony possesses all the institutions necessary for its requirements, and that the people have the capacity of carrying on their government and of doing all that is possible to make their own lives and those of their fellow-islanders as useful and pleasant as possible. Although they lead a quiet life there is enough variety to preserve the *mens sana in corpore sano*, and the islanders generally give one the impression of being sober, well behaved, intelligent people. Their manners are exceedingly frank and open, and there is an utter absence of deception or double-dealing.

English is, of course, the language spoken on the island; but even in the little community there are differences in the mode of speech. Some of the people speak very good English, rather slowly but very distinctly; in the speech of others there is a regular American twang observable; while some of the women and the younger people have a peculiar sing-song way of speaking which is rather difficult for a stranger to follow. Indeed, when they talk among themselves it is almost impossible to understand them.

In all the islanders the organs of perception are developed to a remarkable extent. They have eye-

sight almost as keen as a telescope, and their sense of smell is so acute that some of them are said to be able to smell a ship before she is in sight of the island, and to be able to say if the coming vessel is a sailing-ship or a steamer. Whether allied or not to these faculties, there is found among the islanders, and particularly in a few individuals, a something akin to what is known as second-sight. The direction this second-sight usually takes is that of foretelling a death, and several instances are given by the islanders in support of their belief in this uncanny power of prediction. Perhaps the most remarkable is the case of William Christian. This man sometimes sees at night a ghostly light shaped like a heart, which moves about both inside the house and out of doors. A death is said always to follow in the vicinity in which the 'Red Heart,' as it is called in the island, disappears. What first caused Christian to associate the 'Red Heart' with a coming death was that he saw it one night hovering over the room of his brother. About a month afterwards this young man met his death as the result of an accident. Again, some months before the death of Christian's mother, the 'Red Heart' made its appearance one night, vanishing over her room. It may here be observed that the houses at Pitcairn are of one story, and in order to keep them well ventilated and cool the rooms are divided by partitions which do not go right up to the ceiling. It would thus be easy to follow the movements of the 'Red Heart' inside the house.

Another instance of the fatal appearance of the 'Red Heart' is as follows: One night Christian saw the 'Heart,' and got up and followed it. It led him out of doors and in the direction of a certain house, near which it disappeared. In this house was a young married woman who was shortly expecting to become a mother. There was nothing in her condition then to give any cause for apprehension, but she died not long after in giving birth to the child.

Of a different nature was the following experience, though the result was the same. On 11th October 1888 a young woman was fishing from a rock on the island. She had caught a fish, and had turned round to take it off the hook when she heard a sudden splash. Turning round, she saw what she declared to be the head and shoulders of a man disappear under the water in front of her. She was terrified at the sight, and ran screaming up the rocks to the nearest house, where she related, as well as her half-fainting condition would allow her, the horrifying spectacle she had seen. There was nothing to account for the splash. None of the islanders were missing, nor had an animal fallen over the cliff, for there are only a few domestic animals on the island. The young woman was most emphatic as to the appearance of the form, though she could not distinguish the face. She said the arms were extended, with the forearms bent inwards. There appeared to be nothing with which the apparition could be connected; but in the following January a young man was searching, with his two younger brothers, for sea-birds, when by some means or other his foot slipped, and he fell over the cliff, dropping into the sea at the spot where the young woman had seen the form disappear some months before. The man was drowned, and although search was made his body was never recovered. By some strange coincidence, his birthday happened to fall on the day on which the young woman had seen the accident rehearsed in so mysterious a fashion.

In addition to the cases mentioned, many of the islanders hear at times unaccountable noises, rumbling sounds, or a clattering as of tins. They have searched and found no natural explanation for these sounds, and have regarded them as warnings of an approaching death, which has taken place in due course.

These stories may or may not be taken seriously; but the islanders are all quite convinced of the facts as mentioned, and they believe implicitly in the 'Red Heart' of William Christian, as well as in the other omens of impending death. And if it be objected that, on account of their close relationship one to another, the islanders would naturally give credence to the supposed supernatural powers of any of their number, it happens that at the present time there are two men on Pitcairn who are not descendants of the mutineers. One of these has been on the island for over twenty years; the other, the schoolmaster, for only a few years. Both of them say that at first they were sceptical about the islanders' stories of death, regarding them as mere superstition; now, however, they have a different opinion. The schoolmaster, who is a native of England, assured the writer that when he first came to Pitcairn he had the average Englishman's disbelief in the supernatural; but several things which had since occurred on the island had caused him to change his views.

A curious thing happened while the writer was on the island. Owing to the absence of regular communication no one knew beforehand of the visit to be paid by the two men-of-war, on one of which the writer was serving. Consequently the arrival of the ships was quite unexpected. While on shore we were told that one of the women had dreamed that she saw the two ships come in, and also later on another ship, a sailing-vessel. So far only the two men-of-war had put in an appearance; but some hours after we heard the story a sailing-vessel came in sight and approached the island, being boarded by the islanders with fruit and vegetables. When one considers how rarely ships call at Pitcairn, which is quite off the regular track, it would seem that if the above story is explained on the mere ground of coincidence, it was a coincidence at any rate extremely unlikely to happen. Speaking of dreams, we may say that the islanders take them quite seriously, as they can relate many instances of their

coming true, and the story just mentioned will no doubt confirm them in their belief.

Bearing on what has been said respecting the peculiarities of Pitcairn and its people, the following extract is interesting. It is taken from *The Story of Pitcairn Island*, by Miss Rosalind A. Young, a native of the island:

'It was during the year 1880 that an unusual and very peculiar visitation appeared among the community, affecting only the younger members, eleven or twelve young persons in all having been subject to it. The disease, if such it may be called, was temporary insanity, the case that lasted the longest not extending over two years. The first symptom of the attack was a strange hallucination of the mind, the person affected seeing some object which greatly terrified him, or hearing voices calling to him, then gradually losing all recollection of former events, until the mind became an utter blank. One peculiar feature of the disease was a distorted vision that transformed every object into something different from what it was—as, for instance, a full-grown man or woman appeared as but a child, while a mere baby would assume the full proportions of a man. In almost every case the patient was calm and quiet; the power of speech seemed taken away, while the vacant stare showed that the mind had lost control over itself.

'Many and various were the phases that the disease assumed, each patient being acted upon in a different manner. There has never been any satisfactory explanation of the cause that produced it. The case above mentioned as being of longest duration was that of a young girl whose mind became affected in April 1884, and was restored in the early part of the year 1886. Since that time the peculiar disease has not made its appearance.'

It is hoped that what is here related will be found interesting as throwing a sidelight on the little community. The writer can offer nothing in explanation of any of the stories mentioned, and during the short time that he spent on the island he could discover nothing to account for them in a natural way. It is to be noted, however, that where the 'Red Heart' appeared to indicate the death of some particular person, that person was not informed of the mysterious warning, so that it cannot be said that death resulted as a sort of unconscious fulfilment on the part of the person concerned, owing to his belief that his death was inevitable.

In these days stories of ghosts and uncanny experiences are often taken seriously, as the existence of the Psychical Research Society bears witness. It remains, therefore, only to give such further information as to the habits of the islanders as may be thought to have some relation to the peculiar psychical qualities possessed by them.

I have already said that they are an intelligent people. Several of them have been away from the island for periods of years, and one or two have been educated in America; so that if these, with their greater experience of the world, were not convinced of the truth of supernatural appearances and omens, they would probably have reasoned them out of existence.

The food eaten by the islanders is perhaps a point of importance in this connection. They do not eat much meat, so little being procurable; and fruit, vegetables, and cereals form the principal articles of diet. Moreover, all the islanders are total abstainers, not merely from principle, but from choice, as they have no liking for alcohol. The same thing applies to tobacco, which they do not use in any form, and would not accept when offered to them.

In talking over what is here related with Miss Young, I asked her if, seeing that the inhabitants of Pitcairn Island were descended on the maternal side from natives of Tahiti, the wives of the mutineers, they might not have derived their peculiar qualities to some extent from that source; further, if there was anything in the history of the Tahitian people to show that similar beliefs in the supernatural were held by them. Miss Young replied that it was very probable that the Tahitian strain of blood had something to do with the possession of the qualities mentioned. She could not say, however, if the history of the Tahitian people would bear this out, nor did she know whether there were among the natives of Tahiti instances of a like nature to those recorded at Pitcairn. And the writer has not at his disposal any information on these points.

THE MAVIS.

When sunny glades 'mid woodland shades
Betoken winter past,
And peeping flowers 'neath birken bowers
Foretell the spring at last;
The mavis then, in wood and glen,
Breaks forth in sweetest song;
From throbbing throat his rich, full note
Comes piping clear and strong.

On fir-top high, against the sky,
Now mark his dainty form,
As by the hour, through breeze and shower,
He bravely breasts the storm.
The while he swings he gaily sings
His happy roundelay;
Good cheer! good cheer! the spring is here!
He almost seems to say.

Dear little friend! may grief ne'er rend
His bonny speckled breast;
But may kind fate defend his mate,
And guard her clay-lined nest;
Till, by-and-by, the young ones fly
The summer woods among,
And safe from harm in turn they 'll charm
Another spring with song.

Bright-feathered birds may mimic words
In western forests wild;
The nightingale in southern vale
May king of song be styled;
But, ah! to me, though he may be
In quiet colours dressed,
The mavis still for ever will
Be dearest, sweetest, best.

SIXTH SERIES.

VOLUNTEERING IN PERTHSHIRE A HUNDRED YEARS AGO.

By Sir ALEXANDER MUIR MACKENZIE.

THE story of volunteering in Perthshire is treated by the Marchioness of Tullibardine in her book, *The Military History of Perthshire;* and this short paper is in no wise to be held as competing with her history in information or public interest. But having in my possession a long correspondence between Sir James Pulteney (or Murray) and Sir Alexander Muir Mackenzie of Delvine on the merits of a scheme, called 'Local Militia' or Volunteers, in the years 1806–7, it may be interesting to compare these notes with the newly proposed Territorial Scheme of 1907, and see whether we have progressed in our system of military organisation. The interchange of ideas between the General and War Office official and the county magnate shows the intense interest taken then as now in the defence of our island, although the question arises in 1806, as in 1908, whether this has to be undertaken by 'volunteers' in the widest sense or enforced by ballot, another way of spelling conscription.

We have been voluntaries from the very beginning. When Agricola landed to invade Caledonia (84 A.D.) Gald Cacher assembled his levies, 'ubi hymenavit in Atholea,' among the Grampians, and we are told 'they behaved with such wroth and bravery' that no 'Dux Romanus' left much impression on the 'dwellers in the coverts,' as the 'Celydoniad' were called, nor did the Romans gain any important success before their ultimate retirement from Britain.

And so has it been with our army and our navy (if we except a few episodes of the press-gang), our services being recruited in a voluntary manner, as contrasted with the conscription, by obligatory methods, of foreign countries. Even the militia ballot, when put in force about the end of the eighteenth century, was highly unpopular, and caused riots in different places (see *Atholl Chronicles*, vol. iv.). The Napoleonic scare in 1803 brought out a goodly body of Volunteers or 'local militia;' and in 1806–7, when there were four regiments in Perthshire, the following correspondence ensued, and the question of a defensive army was thoroughly discussed. The story of the Volunteers is, as already mentioned, fully given by the Marchioness of Tullibardine, and need be referred to here but generally.

Sir James Pulteney (a Murray of Clermont) was the Secretary 'at' War in 1806; and as his brother-in-law, Sir Alexander Muir Mackenzie of Delvine, was in command of one of the Perthshire regiments* of 'local militia,' a good deal of correspondence ensued, in which ideas were exchanged with some forcibleness—the General and War Office official, with his acquired notions of drill and discipline, contrasting with the *suaviter in modo* but *fortiter in re* as expressed by the colonel of a local militia. A few of these interchanges of opinion are here set forth, showing what men, military and civilian, thought of the peril then, just as our military and civilians are, in this year of grace 1908, considering how best to put our house in fighting order.

It will be noted that neither is in favour of conscription, and both advocate a sort of 'compulsory volunteering' with a 'compulsory levy' in the background, to be made use of should the patriots not fly to arms with sufficient zeal, even into the corps of Fencibles.†

The Breadalbane Fencibles were raised in the years 1793–4–9. Mr Wyndham, Minister in charge of the Army Estimates in 1806, spoke most disparagingly of the force—'these objectionable estimates of the Fencibles,' referring to the Manx Fencibles raised in the Isle of Man by the Duke of Atholl, 1793‡—

* The 4th, or Stormont County Militia. For his services he received a stand of colours, worked by the ladies of Perthshire, and a handsome silver epergne and casket.

† Fencibles, a species of militia, not available for foreign service, but for defence against invasion, raised in Argyleshire, 1759.—Grose, *Mil. Antiquities.*

‡ *Atholl Chronicles.*

 [*All Rights Reserved.*]

which roused the ire of the colonels of local militia. He was one of the Ministry of 'All the Talents,' satirised in a poem by 'Polypus' and 'Scriblerus':

A rushing mind,
Imprudent, injudicious, o'errefined.

EXTRACTS OF CORRESPONDENCE.

Sir James Pulteney writes (January 1807) to Sir Alexander Muir Mackenzie of Delvine, colonel of the local militia: 'You propose to compel the counties to produce a certain number of men by the dread of a ballot, and I to make them produce the same number by its immediate operation. Your system is as much compulsory as mine, while mine is as much voluntary as yours, in regard to the individual, in consequence of substitutes being permitted. You bring forward volunteers by certain inducements, the principal of which is the exemption from ballot for the old militia. I bring forward "local militia" by the same inducements, aided perhaps by that of a small bounty to be given by the principal. Therefore one plan is as much compulsory as the other, and instead of using the compulsory form of the ballot, it may be thought better to leave it in the hands of the Lord Lieutenants of the counties to adopt some other mode of producing their men, . . . but I consider that the less they have of the character of volunteers, and the more they have of the character of regular soldiers, the better they will be adapted for the great purpose of defending their country. You may say that if the zeal of the people of Scotland happens not to be equal to that of their neighbours, it may be right, as a matter of policy, to make a different arrangement.

'A material point is the length of time to be allotted for "*permanent*" duty. I have no doubt that the period of six weeks at once is best. Perhaps this would be thought severe, but it would be only twice in a man's lifetime,* and, being voluntary, would be compensated for. The difficulty of obtaining officers for a local militia, whereas there is less for a Volunteer corps, must be considered, although this should not be.'

In the present day it is the reverse that holds good. Young gentlemen readily enter the militia as a training ground to commissions in the army. Except in the case of the 'Scottish Horse,' there is a considerable dearth in some of the Volunteer corps. I venture to think that an officer retiring from his regiment, of the Line, might be allowed to join his county militia regiment as a supernumerary of the rank in which he retired.

'I observe,' continues Sir J. Pulteney, 'that the Duke of Atholl agrees with me in the two material points that a local militia and Volunteer force as proposed by you are the same thing, and I agree with his Grace that it would be desirable that the present Volunteers should convert themselves into a local militia, and not allow the men, by whatever name called, to withdraw at pleasure.

'You justly observe that one or two hundred thousand men are not sufficient.

'I conceive that four hundred thousand well trained would be sufficient.'

Sir J. Pulteney and Sir Alexander M. Mackenzie both comment on the hardships imposed on the patriotic Volunteer as compared with the stay-at-home citizen. 'It is noted how difficult—well-nigh impossible—it is to withdraw men employed in agricultural labour from the work in the fields, whether seedtime or harvest, for the purposes of training, while in the towns the class of men employed have more leisure, and the distance to the drill-ground is not such an insuperable objection as it is often in the country.

'It would appear doubly hard were a man, who has bound himself to turn out when required, to be told by his employer that he must give up his situation, whereby he not only loses his work and pay, but sees the "stay-at-home" drop into his place and enjoy his wages.' But it is equally hard on the farmer or manufacturer to lose the services of some of his best if not head men at the times when work is busiest and remunerative.† And in Germany the inconvenience is very much felt. In Coblentz, when I last visited it, the Landwehr were called out for annual drill in camp. I asked of the hotel-keeper, of the pottery manufacturers, and of some of the leading warehouses how they managed to dispense with their superintendents of departments, clerks, and even cooks. The answer was almost invariably the same: 'We cannot afford to do without these assistants, so we employ Dutch or Swiss as cooks, head-waiters, clerks, and general head employés.'

The question of substitutes to be provided or paid for by those wishing to evade joining a Volunteer body is taken into account, and an argument entered into whether such substitutes should 'escape the ballot.' 'In any case, those serving should receive ample indemnification, and captains and subalterns at least were to receive annual pay to recompense them for the "extraordinary expense they were unavoidably put to."'

The question of remuneration for military service is noted as a great difficulty. Those who make soldiering a profession of course expect a fair wage for a fair day's work; but to those who give up part of their time, which should be spent profitably in agricultural, industrial, or what is called professional pursuits, it is a more serious matter, and suitable remuneration a difficult problem. In fact, how to secure a citizen military force without crippling the 'industrial' army was as great a difficulty in 1806 as in the present day.

'Those whose occupations are carried on in their own houses or in workshops can without much difficulty make up for the time lost to their employ-

* This refers to the details of the 1806 scheme, on which it is not necessary to dwell.

† This certainly obtains in the present day.

ment by working at extra hours; but those whose business requires daylight—as agricultural labourers working in the open air—are not so fortunate, and after eight to ten hours' field-labour are disinclined for military drill or exercises.

'When the Volunteer system was established * in 1803 the alarm was great all over the country, and people readily submitted to what they were satisfied was necessary. Since that period, however, the danger has from its familiarity become less impressive, and the inconveniences (of service) has been more severely felt, and the consequence is that many farmers become extremely unwilling to engage any person who is a Volunteer, and this also holds in other professions.'

Sir Alexander M. Mackenzie was very clear 'that any expense incurred must be paid for by the public, and that nothing be left to private exertion.' When the Volunteers were last established (in 1803), the inadequacy of the Government allowances made it unavoidable to have recourse to private funds, so that the liberal and patriotic paid for the penurious and factious. He recommended 'that if any battalion or corps of Volunteers shall remain incomplete in its numbers . . . for more than a month at each time, an equal number of men be raised by compulsory law.'

'In matter of dress, *point d'argent, point de Suisse*, "no fine coat, no volunteer," it is necessary to encourage smartness, even though it is to appeal to the vanity of the individual.' The expense of the clothing of 'our' men was as follows: coat, breeches, and gaiters, two pounds and sixpence; cap, six shillings; greatcoat, thirteen shillings and sixpence; knapsack, six shillings—three pounds six shillings; less, Government allowance, one pound ten shillings—total, one pound sixteen shillings.

He is also sure that the four hundred thousand men deemed necessary for the defence of the country should be properly trained (although he makes no mention of musketry) in the 'first class,' and the 'remainder to be armed with pikes'! 'Another class should be formed to attend the army as labourers, artificers, drivers of carts, &c.'

All these men, if Volunteers, were to be exempted from the ballot, which neither Sir A. M. Mackenzie nor Sir James Pulteney approved, 'as only furnishing a discontented set of men, and not the true patriots,' but retained *in terrorem* over the class who will not turn out and learn how to defend their native land. I fear this may be held to include some of the *jeunesse dorée*, 'who might then turn out with more alacrity.'

Mr Haldane's Scheme of 1906–7 is to come into operation in March 1908. It is not my intention to criticise the scheme for a Territorial Army, but merely to note wherein it is similar to the arming in 1806, and in what points it differs.

The object of the earlier dates was to secure an adequate force of able-bodied men to act as defenders of their country, by voluntary measures, failing which the plan of a ballot or compulsory levy was to be made in districts that failed to supply their quota. These bodies to the amount of four hundred thousand men were to be under military authority.

Some difficulty was apprehended in securing the services of agricultural labourers. The ballot or other compulsory measure was disliked, as tending to produce an unwilling or discontented class; and it would evidently have this drawback, that the willing citizen might be passed over and the unwilling coerced. The class subject to the ballot would necessarily have to be restricted and many exemptions made, as is the case in foreign countries, where conscription is the rule, rendering the levy on those remaining more severe. Mr Haldane's scheme provides for a large body of men. In Perthshire it is reported there is to be but one regiment instead of two as at present, and four as in 1806. In addition there will be the regiment of Scottish Horse mountain batteries and (under certain conditions) members of rifle clubs. Possibly there may be a register of what may be termed non-combatants—carters, drivers, smiths, and the like. A motor reserve may also be formed, while a mountain battery will serve along with the Scottish Horse; and even a cyclist section might be formed, with a machine-gun. The same difficulty arises now as then how to make this defensive service universal, so that each man should bear part of the burden, and this without unduly disturbing the industrial progress of the country, agricultural and manufacturing. Instruction camps are costly, especially to officers, and the charges for dress and equipment press very heavily on the individual, as well as on national finances, if the regimental grants are at all adequate. Transport to and from camp is a very costly item to the native, and it is humbly suggested that some allowance should be made to county authorities to defray damage done to roads by this extraordinary traffic of heavy guns and transport wagons.

We would ask, why are all our defenders to be chosen out of the boys of the country? The Germans make use of their veterans in their Landsturm. There are plenty of old soldiers both willing and able to take part in defensive work or to serve in garrison and act in many cases as instructors.

King Edward has summoned together the Lord Lieutenants of counties, and committed the care and encouragement of the new 'Territorial' or 'Terriers' to these gentlemen, especially appealing to the 'owners and cultivators of the soil.' Why His Majesty selected these particular classes is not easy to see. Why owners of the land and their workpeople, already severely taxed, should be called upon to bear the heaviest part of the military defence, and the great manufacturers, dyers, brewers, distillers, ironmasters, and coal-owners, with their army of necessary labour, to

* The word should be re-established.

escape, the King's Speech does not tell us. The professions, clerical and artistic, are not appealed to. But 'Hodge Dumdrudge,' like the patient ass, is to receive all the kicks, the ha'pence (I opine) but in small measure. The 'owners and cultivators of the soil' will do their share, but so ought the owner and the holder of the shop.

Thus wrote the satirists of the period of Mr Wyndham's Bill, 1806: 'You are alienating the affections of the army. Even the Volunteers, Mr W-n-d-h-m, are disgusted; and as to your *grand military system*, the whole service laugh it to scorn. Though the military system may have failed is not your fault; you have spent eight hundred thousand pounds on it . . . extra, in order to fail as a Secretary should fail, and to show people how economical (*sic*) Ministers are. . . . No sum too trivial to look after.'* Fifty thousand pounds saved by not purchasing home meat and buying American horseshoes in lieu of British.

A PAWN IN THE GAME.

CHAPTER XIX.—IN PARIS ONCE MORE.

A BITTER February gale was blowing over the housetops of London as Lord Granville sat in his room at the Foreign Office discussing Paris affairs with his permanent secretary; and the conversation, little as Jack could have guessed it, brought matters to a crisis as far as he was concerned. England had been profoundly affected by the execution of Louis XVI. It was perhaps even more deeply stirred by the perils which hung round the unhappy queen and her children. They were held as prisoners in the Temple. What was their probable fate? The English agents in Paris were timid or stupid, and the Foreign Office was badly served.

'Can't you send a clever and trustworthy agent to Paris to see what can be done?' Lord Granville asked.

'We have no one whom we can send on such an errand. It is too risky. And if we found some one to take the risk of going, we could not trust him.'

At that moment Pitt entered the room, and the suggestion was laid before him. He had a genius for choosing fit instruments, and he never forgot a face.

'Send that young fellow—what is his name?—Lawrence, who was in the September massacres. He can be trusted.'

An hour later Jack was called into the room of the permanent secretary and his commission given to him. It was great promotion! And to be sent on the suggestion of Pitt himself upon an errand so gallant kindled Jack's imagination. There was risk no doubt, for the shadow of the guillotine lay black on Paris; but who would stop to weigh risks in such a task?

Denise's face went suddenly white when the news came. She was not sure she loved Jack—at all events as he wanted her to love him; but the mere thought that she might lose him darkened her life. She wanted to tell him this; but speech, somehow, seemed frozen on her lips, and she bade him an almost wordless good-bye. Jack's heart was curiously heavy as he started, by ways known to the secret agents of England, for Paris.

When he reached Paris he sought out his old quarters. It was an old mansion of medieval days, once the haunt of fine gentlemen and grand dames, but now left stranded by the ebb of the social tide. The huge, dilapidated house was a sort of human warren. The fat *concierge* cultivated a useful ignorance of the comings and goings of his clients. If the lodger paid his rent with due punctuality on the first day of each week he was treated as non-existent for the other six days; and each tenant of the mansion had sufficient reason for shunning observation on his own account to prevent him taking notice of anybody else.

Jack still kept the red card of citizenship given him by Toulan; for this, in the Paris of that day, meant safety. He was liable to be challenged at a hundred points, and the possession of that card, as a rule, allayed all suspicion.

Having secured safe quarters, Jack—or Jean, as he once more became—set himself to pick up the thread of personalities and events in Paris. Dressed in blouse and red cap and sabots, he loitered in the streets and cafés, listened to the orators of the Convention, squeezed his way into the crowd at the Hôtel de Ville, and watched the noisy debates of the Commune there. He was anxious to get in touch with the Rat, for he had an instinctive sense that of all his Paris acquaintances he was the one to be most trusted; and Jean watched day after day at the gate of the Abbaye in the hope of seeing him.

The grim gates, to his imagination, wore an aspect of gloom. The shadow of the September massacres lay on them. In the gathering twilight the huge black mass, with no gleam of light visible in it, no cheerful sound of voices rising from it, seemed as if it were brooding over the dark crimes it had witnessed. But Jean watched for the pointed chin, the shambling and furtive gait, of his old comrade in vain. Some eddy in the fierce current of events had swept him away.

Toulan was easily discoverable. His energy and daring had made him a prominent figure in the Commune, and Jean saw him, with quick step and

* 'Scriblerus' on 'All the Talents' (1806).

tri-coloured sash round his waist, strutting into the wide doorway of the Hôtel de Ville with an absurd air of authority. The Commune at that moment divided supreme power with the Convention; it had the office of a whip to quicken its speed. By a daring stroke it had made itself the custodian of the royal family. Louis XVI. was dead, and the Convention had directed the surviving members of the royal family to be imprisoned in the Luxembourg. The Commune declared that building to be insecure, and settled the business by seizing the queen and her children and carrying them off to the Temple—a gloomy medieval tower that lifted its black rectangular mass high above the northern roofs of the city. There the little cluster of despairing captives was kept under sleepless guard.

Jean studied keenly the prison of the unhappy queen and her children; he watched for hours the constant coming and going of guards and of commissioners with gaudy sashes. The building was strongly garrisoned, and was plainly watched with great vigilance. Round the whole area occupied by the tower and its outbuildings ran a slender film of tri-coloured ribbon. A child's finger could have broken it; but it was a symbol of the authority of the Republic, which shut like a steel girdle round the dark tower with its little group of unhappy prisoners.

Jean doubted long whether it would be prudent to approach Toulan; whether, indeed, it was fair to the impulsive Southerner himself to attempt to set up relations with him. He was now an influential and trusted member of the Commune. This gave him a position in which he, no doubt, could render great services to the secret agent of the British Foreign Office; but it was a question whether with him friendship would outweigh public duty. England and France were at war, and the quick-witted Southerner would be sure to suspect Jean of being in Paris on some errand which a good citizen ought to denounce.

While Jean hesitated, events settled the question that perplexed him. He walked away from the Hôtel de Ville one evening, and was finding his way through the narrow streets which led to his own lodgings, when a strong hand clapped him on the shoulder. He swung quickly round, for there was something official in the touch. It might mean arrest. He was confronted by the flattened nose, the black eyebrows, the audacious eyes of Toulan. His countenance was as friendly as ever; he embraced the hesitating Englishman with effusion, and broke into a torrent of questions.

Where was the little one? Was she well and happy? 'Ah! she was clever,' he exclaimed, 'to bring in Pitt;' and he laughed noisily at the recollection of the scene that terrible night in the Abbaye.

'You served us well in that hour of terror.'

'Ah! they were mad,' cried Toulan. 'The fools! They went too far. And it injured the Republic. It made the world think us a gang of assassins.' And the Frenchman frowned darkly at the memory.

They chatted long together; and, after they had parted, Jean reflected with wonder on the circumstance that Toulan had accepted his presence in Paris without question and as being quite natural. He showed little curiosity as to his business, and no suspicion. Nay, there was a curious gladness in Toulan's welcome of Jean which puzzled him.

Jean fell into his old familiar relations with the ex-shopkeeper of the Feuillants. They met frequently, and Toulan had no reserves. He was one of the commissioners on duty at the Temple, and when Jean talked with him about the royal prisoners he found him surprisingly communicative. Toulan discussed the other members of the Commune, the incidents of daily life in the Temple, and the drift of politics in the Convention with an almost perplexing frankness.

Jean pushed his inquiries into such matters at first with much caution; but caution with the open-hearted Southerner, he quickly found, was unnecessary. The two fell into what the young Englishman, with a touch of amusement, felt was a comradeship that had in it something fraternal.

(To be continued.)

THE WORLD'S GREATEST FISH-POND.

HE world's greatest fish-pond is so far within the Arctic circle that the fishermen who venture there must sometimes be shut off from the rest of the world for years, since Hudson Bay is held so long in the grasp of winter that it is impossible to enter or leave it after the season of what is called midsummer in the temperate zone. In the waters of Hudson Bay, however, are found the great bowhead-whale, one of the largest of all marine creatures. Years ago the bowheads were hunted in the North Atlantic Ocean, as they were numerous in the vicinity of Newfoundland and off the coast of Labrador; but they are so valuable that the whale-fishers of the world searched for them, and vessels from nearly every country in Europe as well as Newfoundland and America were fitted out for their capture. Consequently they are seldom seen in any ocean, and have gone into this Arctic sea, which is almost inaccessible.

So difficult and so dangerous is the quest for the bowhead that only a few whale-hunters now pursue them. Most of these come from the old town of New Bedford in Massachusetts. Here steamships are built and equipped especially for the service.

In addition to powerful engines, they carry a full suit of sails, while their hulls usually consist of two skins of heavy oaken plank bolted to the framework of oak or steel. Great strength is necessary, because they may be obliged to force their way through hundreds of miles of icefields, and during the long, bleak Arctic winter they are so embedded in the ice that its movement would crush the vessels if they were constructed in the ordinary way.

When a whaler leaves for the long voyage to Hudson Bay the captain calculates on reaching its entrance sometime during the month of August, sailing from the home-port perhaps six months before. As the ship must round Cape Race, it is exposed to the winter gales of the Atlantic and the dangerous passage through Hudson Strait. Reaching the bay, the ship is navigated to some berth where the remainder of the winter is spent; for sometimes the entrance to the bay is free from ice only a month or six weeks during the entire year, and, as already stated, the summer season is very short in this latitude. The crew pass the long months amid the snow and ice as best they can until the temperature loosens the ice and the south winds drive it from the bay. Then they start upon their hunt, losing no time, for they may not have two months of open water before they are again embedded in ice and snow until the next year. Seldom do the whalers start on their homeward voyage within two years after they have left New Bedford, and frequently fully three years elapse before they again moor at its wharves.

It is a question if any calling is more dangerous or attended with more hardships than the hunting of the Arctic whale; but the creature is so valuable that its pursuit is as fascinating as the search for the gold-vein. A single specimen may yield oil, bone, and other substances which are worth from three to five thousand pounds. Some have been killed which have actually been worth to the successful hunters over five thousand pounds. The product most highly prized, however, is what is generally called whalebone. As a matter of fact, whalebone is not a bone at all, but a flexible fringe on the creature's jaw in lieu of teeth, to enable the whale to separate from the sea-water in which it floats the marine animalcules on which it subsists. It allows the water to enter its cavernous mouth, then closes its jaws, expels the brine through this fringe, and swallows the minute food which satisfies its mighty bulk. Each whale has about four hundred plates of this 'bone' in its jaws, its teeth being embryonic only. The huge carcass yields much oil, it is true, but the oil alone would not make the venture pay, and the practice has been, after 'flensing' or stripping off the outer coat of fat or blubber, to let the remainder go, and the skeleton with the covering of flesh which enshrouds it, weighing from forty to fifty tons, usually becomes the prey of sharks.

The bowhead contains far more whalebone than any other species of marine animal, and this is why it is so eagerly pursued. It takes its name from the curved formation containing the whalebone which is found in its head. Occasionally one is killed which has a double fringe of the bone. In the early days of whale-hunting in Hudson Bay, one monster was harpooned from which over three thousand pounds were taken, and the bone sold for three thousand pounds sterling a ton. This single capture paid all the expenses of the voyage, which lasted two and a half years, and each man received in addition one hundred pounds as his share of the proceeds. But the whaler usually secures three or four whales each season, so that often the ship returns with a cargo so valuable that, after all expenses are paid, every man receives at least five hundred pounds to one thousand pounds as his share of the hunt. Yearly the number of whales caught is decreasing, and the price of the bone increasing in proportion.

In the modern method of capturing the great Arctic whale the harpoon thrown by hand is seldom used. Each ship carries a small cannon mounted on the bow, and frequently has a small steam-launch which is also armed with what is known as the harpoon-gun. When the bay becomes navigable the vessel starts for the places which are most frequented by the whales. The veteran Hudson Bay whaler knows where the favourite feeding-grounds of his prey are situated. When one has been sighted, the vessel is stopped within gun-shot of the creature if possible. The cannon is aimed at a point over the heart, and its projectile seldom fails to enter the body, so true is the aim of the gunner. This projectile is several feet in length, and contains a bomb filled with some explosive which is ignited by a time-fuse. The projectile also contains a 'head,' consisting of four large steel barbs which spread out as soon as it enters the body and are caught in the flesh. The bomb is intended to explode inside the whale, and if properly aimed seldom fails to reach a vital part, causing death within a few minutes. If it has not been mortally wounded, however, the whale seldom escapes its pursuers, for attached to the projectile is a stout rope which is fastened to a steam-capstan or a winch on board the ship. Sometimes the creature will tow the vessel several miles in the struggle to free itself, but in the end becomes exhausted. Then the captain lowers a small boat. The crew row to the side of the whale, which is killed by plunging a long lance into its heart. If it is young, with soft, yielding flesh, or if it is struck near the tail, the harpoon usually goes right through and the bomb explodes harmlessly in the water on the other side. In such cases the whale is good for many hours of struggling.

An immense bull-whale, the largest ever taken in these waters, was harpooned, and for twenty-six hours dragged the ship about after him, three harpoons in all being shot into him before he succumbed. So furious was he that the men of

the ship had to keep keenly alert all the time, fearing that in his mad rushes he would attack her, in which case he would destroy her with a blow of his head. When he 'sounded' into the deep sea a man armed with an axe had to stand by the bow ready to cut the line if danger threatened from this cause, as he frequently pulled the vessel's bow nearly level with the water. This monster yielded fourteen tons, or three thousand five hundred gallons, of oil, besides an immense quantity of bone; though it cost about twenty pounds for repairs to machinery damaged by the strain he put on it. No other similar case has occurred of such a long fight being made; but it is not unusual for a whaler to be towed around for ten or twelve hours by a maddened bowhead, though her own engine is going 'full speed astern' the whole time in order to tire out the whale.

In the waters about Newfoundland a fleet of small steamers are engaged in whaling, and occasionally a bowhead is taken, although the prey generally consists of other species. These vessels have a draught of one hundred and fifty to two hundred tons, and they are also armed with cannon having an explosive projectile. They usually remain in the bays which indent the coast of the island, and are operated in connection with what is known as a 'station,' which consists of a place where the carcass can be cut up, and where the oil can be extracted from the whale and the refuse made into a fertiliser. The small whales are so numerous in the Newfoundland bays that many of them are caught within forty or fifty miles of the station by the whalers, yet are attacked in the same manner as the Hudson Bay whales, and sometimes four or five will be captured in a day. As soon as one is killed it is placed in charge of a boat-crew, and the steamer continues in search of another. At the close of the day the vessel returns from her cruise, picking up the carcasses of the whales on her way, and tows them to the station like a raft of logs or timber. At the station they are drawn out on shore by means of a rope and tackle, and cut to pieces by tools especially made for the purpose.

When this whale-fishery was inaugurated six years ago, only the fat, which yielded a plentiful supply of oil, was 'flensed' or stripped from the carcass, and the remainder—flesh, bones, and intestines—was allowed to drift away, three-fourths of the bulk of the animal being thus abandoned as worthless. But now factories have been established for converting all this previously wasted material into guano, and there is not a bit of the whale which is not now turned to profit. Even the rib and other bones are being split into their component parts to make unbreakable ware resembling crockery, which water will not injure and heat will not spoil, and which can only be rendered useless by being chopped up with an axe. The blood, by a contrivance now employed, is caught in a reservoir as it flows from the body when cut open, and mixed with the fertiliser to increase its richness, instead of being allowed to flow into the sea.

SERGEANT MAZET AT BORODINO.

By W. D. Gray.

'AND so you are going out to this Crimea, eh?'

'Why, yes, sergeant,' said one of the young cavalrymen. 'We set out next week to join our English friends.'

'Did you ever serve against the Russians under your great Napoleon?'

The old *invalide* leaned forward in his chair, and his dull black eyes lit up angrily. 'Did I ever serve against the Russians?' he repeated in a harsh voice. 'Well, messieurs, when a man has fought at Austerlitz, at Eylau, and at Friedland, finishing up with a little promenade to Moscow and back, living in the snow for fifty-two days, and eating half-raw horseflesh, he may be said to have fought against the Russians, eh?'

The hussar hastened to apologise. 'Of course, of course, *mon vieux!*' he said. 'I did not know. Come now, let me refill your glass, and then you will perhaps tell us some of your experiences in the Moscow campaign?'

The veteran hastily swallowed the wine and then lighted his pipe. He puffed away slowly and steadily for a few minutes, while his lined yellow face seemed to grow graver and sterner. Then he looked round the café table at his three young companions.

'My experiences?' he said. '*Mon Dieu*, yes, I had some experiences in that campaign. You may pray to the good God, *mes enfants*, never to have the like. It is over forty years ago, but I remember that retreat from Moscow as if it were yesterday. You cannot imagine what it was like, especially those last days from Smolensk to Wilna. I believe at that time if I had seen my brother dying by the roadside I should not have stopped to aid him; if I had seen my dearest friend eating a loaf of bread I should have torn it from him. Oh yes, I had my experiences! But I cannot tell you about that retreat; it was too horrible. I trust this Crimea you are going to is not near Moscow? It is not, you say? So much the better for you. Still, if you wish for something a little more cheerful I can tell you a story of the battle of Borodino, or the Moskowa, as we used to call it.

'In those days, you must understand, I was a sergeant in the Fortieth Chasseurs, and at the time of the Russian campaign there is no doubt that we were the finest regiment of light cavalry in the Grand Army. You cannot conceive what we were like, for since Mont St Jean our army has altogether changed. But if we were the best regiment in the army, we had the worst colonel. I do not mean he was a poor soldier; indeed, he was a good officer and knew his work. I mean he was one of those men who set the teeth on edge; you felt on first seeing him that there must be something wrong with him, something crafty and evil. Lépine, that was his name—Colonel Auguste Lépine. He was very tall and thin, of a dark complexion, with a long wiry moustache and small bright-black eyes. He was appointed to us after Wagram, where our old colonel had been killed, and I remember well my first sight of him. We were drawn up for inspection, and he came riding past my squadron. As soon as I saw his face I said to myself, "Mazet, my friend, you are going to have a bad time;" and I was right! He treated us veterans of Austerlitz and Jena as if we had been a squadron of recruits from the depôt. We could do nothing right; on parade, at drill, mounted or afoot, we always had his vile, rasping voice sneering and snarling at us. Ah, well! he has been dead forty-two years now, and yet I must admit I hate him still, and I still see that narrow, evil face of his in my dreams.

'At the beginning of the march to Moscow the one man in all the regiment to whom he was most unjust and severe was Captain Bourayne, commanding my squadron. Thunder of God! when I think of what he had to suffer, of the cunning insults he endured in the name of discipline, I feel my blood boil. My captain was the very opposite to the colonel, as different as light from dark. He was young, gay, and light-hearted, but a good officer, keeping splendid order, and looking after us as if we had been his children. We all loved him—ay, there was not one of us in the squadron who would not have died for him. You may not understand how it was with us, for you do not have such officers nowadays; they all seemed to die out with their Emperor.

'I must tell you that there were a few of us in the squadron who knew the reason of the colonel's harshness, and I myself knew it better than any one. It was a woman, a lady of Poland. I suppose you have never been to Poland, eh? Well, it is a very bad country to make a campaign in, but the women are the finest in Europe. We had been quartered in Warsaw some time before the Russian campaign, and it was there my captain fell in love. I believe the lady loved him in return, though I never really knew for certain. It is to be hoped she did; for, my faith! she often made him look miserable. I used sometimes to take his messages to her house, and then she would give me a glass of wine whilst she sat down and replied to them. I remember that it was very good wine.'

'What was she like, sergeant?' asked one of the hussars eagerly.

'What was she like? Why, name of a pipe! I cannot call her to mind exactly, it is so long ago. But she was tall and dark, and there was a sort of glow and sparkle about her face which somehow made you keep looking at her. Yes, I suppose she would be what is called a beauty. However that may be, she attracted my captain; and, as I was going to tell you, she attracted Colonel Lépine also. Our good colonel was one of those men who imagine they are invincible with the ladies, and he was always pestering her with his attentions and riding up to her house. Perhaps he met my captain there. I do not know. At all events, before we left Warsaw he had asked the lady to marry him, and she had refused. *Diable!* I should have liked to have been present at their interview and seen him rebuffed. It makes my heart warm to her through all these years. But, moreover, the colonel also heard that Captain Bourayne was the lover she favoured. That was enough for him, as you may imagine. And so, as I tell you, he led my captain the life of a dog. I saw it; the whole squadron saw it; but I never dreamed to what lengths he would go. If I had known what was in his mind I would have sent my sabre through him as he rode at the head of his regiment.

'In the early summer of 1812 we crossed the Niemen, the Emperor and some four hundred thousand of us, and began our promenade to Moscow. I dare say you know something about that campaign? I am not the first old dotard who has bored you with his tales, eh? Well, I served nineteen years in the Grand Army, and saw many strange sights, but never anything stranger than the sight of those thousands and thousands of men spread out over those immense desolate plains. It was not the march of an army; it was more like the passage of a nation. And yet it was more wonderful than that, for half the races of Europe were present—Frenchmen, Italians, Poles, Spaniards, Germans; there was no end to them. And then the miles and miles of supply-trains and ammunition-trains, the horses and the guns, and the Emperor in the middle of it, directing the whole. I do not think you will see a sight like that, *mes enfants*, in this Crimea you are going to next week.

'As we came on, so the Russians gave way before us. You may imagine how annoyed we were with them. As we advanced farther and farther into their miserable country some of our officers began to look a little grave as they thought of the distance we were from France. Every now and then the Russians would make some sort of stand before going back again. At Smolensk, for instance, there was quite a proper battle, and we lost a number of men before we drove them out. But still they retreated, and we followed them until we came to a village called Borodino, about sixty miles from Moscow. Here they had at last made up their minds to face us, and had flung up redoubts on a

range of little hills. There were only about a hundred and thirty thousand of us up at the front now, for we had left a lot behind to guard our rear. Then, too, there were the killed and wounded, and the stragglers—far too many stragglers. But still we thought we were quite enough for the Russians, and the men of my squadron put their busbies on their sabre-points and cheered when they saw that great army in front of them. As for me, I had learnt at Eylau and elsewhere that it was no game for children to fight against these people, but I was quite willing to try it again.

'Now, ever since the crossing of the Niemen, Colonel Lépine had been treating us in his usual manner, like—thousand thunders!—like insubordinate conscripts. All the time, too, he had been especially severe towards Captain Bourayne. But as I look back upon it all, it seems to me that he must also have been patiently waiting for a chance to play his evil game. It had not come to him at Smolensk or Vitepsk, but it came now. He would not fight a duel, for he had a great regard for his own skin, and my captain was a fine swordsman and a good shot. No; he found a better and a more cunning method of revenge in this coming battle.

'The music began early on the 7th of September—almost at dawn. I have seen some little affairs in my time, but I think this was the most terrible of them all. My faith! it was even hotter than Eylau; and if you had served in the Grand Army you would know what that meant. By the time we had got into position there must have been nearly eight hundred cannon at work, all roaring together, the noise enough to split the drum of your ear. Both armies were drawn up in very close formation, and the men were swept away by hundreds.

'The Fortieth belonged to General Latour-Maubourg's brigade, and we did not suffer much at first. But our time was coming. About ten o'clock the regiments were drawn up behind Prince Eugene's infantry, in the intervals between the battalions, you understand. On each side of us were batteries of artillery, and behind us more batteries in reserve. My regiment was on the extreme left, and a little rise of the ground cut us off from the rest of the brigade, so that we could not see them nor could they see us. You must remember that if you wish to understand what I have to tell you. We waited there in silence. Every now and then a cannon-ball would hum overhead, sometimes there would be a shriek, and sometimes a horse would rear up and then fall. I remember looking sideways at the colonel and thinking it would be no very bad thing for us if the Russians managed to put an end to him.

'Suddenly there came the thudding of hoofs, and General Latour-Maubourg, followed by his staff, appeared over the rise and galloped towards us. Colonel Lépine spurred his horse and trotted to meet them. The General spoke earnestly to him for a minute. I could not hear what he said, but knew it must be an order. Then the colonel seemed to reply, then saluted, and the General shook his reins and disappeared over the ridge again. We sat there, craning eagerly forward in our saddles, waiting for our orders. Ah, name of God, when I think of what followed!

'The colonel twisted his horse round and came towards my captain. I was close at hand and heard all he said; saw, too, the evil sparkle in his black eyes.

'"Captain Bourayne," he cried in a high voice, "you will take your squadron and charge those two battalions you see there right in front of you, between our infantry. I shall support the main attack on the right with the rest of the regiment. Do you understand?"

'The captain started, looked at him steadily, and then saluted.

'"Do you understand, I ask?" repeated the colonel imperiously, but his eyes fell under the other's gaze.

'"Yes, sir," replied the captain in a steely voice, "I understand—everything."

'At that the colonel turned his horse's head again, and, shouting out commands, led the rest of the regiment over the rise. He did not look back. So my squadron was left alone.

'I do not mind admitting to you, messieurs, that my heart beat very fast for a few moments, and I dare say I turned pale. You understand I had served sixteen years, and knew something of war. The task we had been set would have been a fine feat of arms for a whole regiment; for a single squadron one would say it was impossible. There was a wide open space to charge over after we had passed our last skirmishers, then a little slope to mount, and then we had to face two strong, unbroken battalions. I was still thinking about it, when the captain beckoned me up to him. His face was flushed, and there was a wild, reckless look about him.

'"Did you hear him, sergeant?" he asked in a kind of hissing whisper. "Do you understand what it means?"

'"Yes, my captain," I answered gravely. "I think it means murder. And I ask the captain's pardon, but I do not think the General gave that order."

'He looked at me with a vague eye as if he had not heard what I said, then flung up his head proudly. "Yes, I know," he exclaimed. "I know what it means, but I am going to obey my orders. Name of God! I will show this scoundrel if I am afraid of him. Return to your station, sergeant."

'As I reined back a few paces I saw him snatch his sword from the scabbard and wave it in the air. "Now, my children," he cried, turning round to us, "follow your captain. *Vive l'Empereur!*"

'"*Vive l'Empereur!*" came the great, hoarse roar in reply, and we began our charge. As we passed

swiftly between the lines of our infantry the men cheered us wildly, their shakos on their bayonet-points. Then we came out into the open, and the Russian fire caught us like a hailstorm. I kept my eyes fixed upon the captain, who rode ahead of us all, confident, erect in his saddle, never once looking back. My faith! it was a deadly business. We went over by dozens; on all sides men dropped from their saddles; horses stumbled and fell; the air was full of cries and the clang of bullets on accoutrements. Still we struggled forward. We had come to the rising ground, when I saw my captain suddenly throw up both hands, then he swayed in his saddle to and fro as the horse galloped, until he pitched over to one side and fell with a thud to the ground. He was dead, shot through the brain. I heard a great groan rise up from the men behind me as they saw their officer fall. For my part it filled me with such a rage as I had never before experienced—rage against the Russians who had killed him, against the colonel who had planned his death, against the whole world. "On, comrades, on!" I shouted. "Vengeance for our captain!" I suppose my voice inspired them, for they howled back like angry wolves, and we rushed up the slope all shouting together. And then, all in a moment, we had broken their ranks and were amongst them. I remember my fury still held me. I saw everything in a kind of red mist, and I stood up in my stirrups and slashed at every heavy, stupid-looking face I could see. I do not know how long I was like this; but suddenly I seemed to come to myself again, and remembered that I now commanded the squadron. There was a great noise going on, men shouting and screaming, the reports of muskets being fired at close-quarters, and the sharp whistle of sword-blades in the air. But it was plain that we could not stop where we were. On every side the Russians pressed up against us by hundreds, thrusting with their bayonets and firing wildly. Every moment we were losing more men.

'I stood up in my stirrups again and waved my sabre towards the French army. "Back," I shouted—"back to our comrades!" They heard me—all that was left of them—and began to rally round me. As soon as we had got together I raised my sword again, we burst through our enemies, and galloped swiftly down the slope, bending low in our saddles. They opened a weak fire on us as we drew clear; but we had shaken them badly, and besides some of our infantry advanced to cover us, so we only lost a few men. At last we arrived behind our batteries again, and I could give the order to halt.

'Then I saw clearly how we had suffered. A hundred and thirty-two men had started on that charge, and twenty-seven had come back, hardly one of them unhurt. Besides our single officer, Captain Bourayne, we had lost three sergeants and seven corporals. Yes, our good colonel had succeeded to admiration.

'If you ask me about the rest of the battle I am afraid I can tell you nothing. We stayed where we were until it was all over. You will admit we had done our fair share, eh? When Caulaincourt's cavalry had finally taken the Great Redoubt and the affair was decided, I led my little band back to the rest of the regiment. They also had suffered, but their loss was as nothing compared to ours. I was in hopes—oh! yes, messieurs, I had hopes—that the colonel was dead; but, on the contrary, he was alive and unhurt. I made my report, telling him of the captain's death. He looked at me, and I think he must have seen something in my face which told him that I knew what he had done. If he had shown any sign of joy I believe I should have fallen upon him as he stood there. But he only said, "Very good, sergeant. You have done well." I saluted in silence and went away.

'All that night I sat by our bivouac-fire thinking, and wondering how I could obtain justice for my captain's death. At times when I thought of him I wept. Yes, I wept—I, Mazet the veteran, the hard one, who had served for sixteen years, and had at that time five wounds and nine great battles to his credit. I thought about him all night, while a warm summer breeze blew over the great plains, and I could hear the cries of the many wounded whom we had not been able to help. But I am not a clever man, *mes enfants*—if I were I might be a General now—and when morning came I had thought of no plan.

'Very early, whilst I was eating my ration with the rest of my comrades, there came into our midst one of the Emperor's staff-officers. Looking about him, he asked if we were the squadron which had made the charge upon two Russian battalions. I replied that we were, and he then asked for our officer.

'"He was killed, monsieur, early in the charge," I replied sadly.

'"Who was it, then, who commanded afterwards and brought you back so well?"

'"I did, monsieur," I answered.

'He stared at me for a moment, then clapped me on the shoulder. "Bravo, sergeant!" he cried. "It was a fine piece of work. And now, my friend, you must come with me, for the Emperor saw the whole affair from his position at Shevardino, and he directed me to bring the commander of the squadron before him. He will want to ask you some questions, I fancy, and you will be rewarded."

'As he said this I could not help giving a cry of joy. It was not because of the promised reward, but because I saw my way to obtain vengeance for my captain. I would tell the Emperor all—our Emperor, so strict and so just, who saw everything and knew everything. He should hear how my captain had been killed.

'I walked by the officer's side to headquarters. We passed by the sentries, and my companion entered. In a few moments he reappeared and beckoned me to come in.

'The Emperor sat at a little wooden table reading some papers. He was bareheaded, but wrapped up in his gray coat though the morning was mild. Two officers stood against the wall behind him, and at another table sat a man having the appearance of a secretary, writing swiftly. I stepped forward and saluted.

'The great man looked up and gave me a keen glance. "Is this the sergeant?" he asked.

'"Yes, sire," replied the officer who had conducted me.

'"What is your name?" asked the Emperor, rising from his seat and coming towards me.

'"Mazet, sire," I answered, "sergeant of the Fortieth Chasseurs."

'"Yes, yes," he said quickly, "I remember you. I gave you the cross after Auerstadt for the bravery you displayed there. Is it not so?"

'"Yes, sire."

'"Ah yes," he said with a smile, "I know all my old grumblers. Well, sergeant, you performed another fine service yesterday, and you deserve another reward."

'At this I thought I saw my opportunity. "Sire," I said in a trembling voice, "I do not ask for a reward. I only wish for justice."

'His eyes seemed to nail me to the wall. "Justice!" he repeated in a rasping voice. "Justice! Do I not tell you I intend to reward you?"

'"Yes, sire," I said; "but it is justice for my captain who was killed that I ask you for."

'He looked at me fixedly and took a pinch of snuff. "I do not understand you," he said abruptly. "Come, explain yourself."

'At that, with a rush, I told him all from beginning to end. I commenced with the affair of the Polish lady at Warsaw and ended with the previous day's battle, giving him my captain's last words and describing how he had died.

'As I went on the Emperor began to pace to and fro across the wooden floor, and at the end he gave an impatient gesture and faced me again. "Tut, sergeant!" he said irritably, "you are talking nonsense. I have heard you so far because you behaved well yesterday, but let us have no more of this."

'I felt my heart sink, but plucked up my courage for a last appeal. "Sire, will your Majesty summon General Latour-Maubourg," I asked, "and, instead of rewarding me, ask him what orders he gave my colonel yesterday?"

'"And why should I do that?" demanded the Emperor.

'"Because, sire," I answered, "I believe the General ordered the whole regiment to charge those two battalions instead of one squadron."

'He took snuff again, frowning. "Yes," he said in a thoughtful voice; "I was going to ask about that. It was a reckless thing for one squadron to do. A mistake, no doubt."

'"No, sire," I said, my heart beating like a hammer. "Colonel Lépine did it purposely in order to kill my captain."

'He whirled round upon me, and those terrible eyes stabbed me like sword-blades. "Have a care, sergeant," he cried; "have a care! Do you understand what you are saying?"

'"Yes, sire," I answered as firmly as I could, "I do."

'His frown grew heavier, and he began to pace across the room again. Suddenly he stopped and beckoned to one of the officers. "Go to General Latour-Maubourg's quarters," he commanded, "and ask him to come here at once." Then turning to the rest, he said brusquely, "Gentlemen, I wish to be alone for a few minutes. Retire into the other room, and remember while you have been in here you have heard nothing."

'When they had trooped out he said, "You see I have done as you asked. You shall have justice, my friend. If you have accused your colonel falsely you may possibly obtain more justice than you wish for."

'He went back to his table and turned to his papers again, still taking great pinches of snuff. I stood stiffly to attention, and stared straight in front of me. I can tell you, messieurs, that wait of a quarter of an hour seemed much more terrible than the previous day's charge. I knew the Emperor; I could see plainly that he was very angry, and that if I could not prove what I had said all his rage would be turned upon me. I trembled as I thought of it, and a cold sweat broke out upon my forehead. But when I remembered I was doing this for the sake of my dead captain I grew calmer and less troubled.

'At last there came the jingle of spurs from outside, the door opened, and the General was ushered in.

'The Emperor shut his snuff-box with a snap and stood up. "Good-morning, General," he said. "I shall not detain you long. I wish to ask you a question."

'"Yes, sire?" said the General in a surprised tone.

'"When you ordered your brigade to charge the Russian infantry yesterday, what orders did you give to Colonel Lépine, commanding the Fortieth Chasseurs?"

'"I directed him, sire, to take his regiment and charge the two battalions in front of him," answered the General.

'I gave a great sigh of relief.

'Napoleon looked at the General with contracted brows. "But he might have mistaken your orders?" he said questioningly.

'"No, sire," replied the other; "for I asked him to repeat my instructions, and he did so. I remember I was careful to do this, because his regiment, owing to a rise of the ground, did not come under my observation, and he would be responsible."

'"Ha!" exclaimed the Emperor sharply. His frown became deeper still, and for some time he

looked darkly at the ground without speaking. All at once he seemed to come to a decision.

'"I want your assistance in a little plot I am devising," he said to the General. "Will you go with this sergeant into the adjoining room and wait behind the door, leaving it ajar so that you can hear what takes place? Tell one of the officers to bring Colonel Lépine to me at once. The sergeant will give you the details of this affair."

'We went into the next room and did as he commanded, standing close against the door.

'"Well, sergeant," said the General in a low, puzzled voice, "what is the meaning of all this?"

'I told him in a whisper as much as I could. When I had finished he drew a deep breath and set his lips together. "My faith!" he said, "I think your colonel is a great rascal, and that you have exposed him finely. But he's going to pay for it when he comes before the Emperor. I never saw him so angry."

'We waited silently, listening to the rustle of papers from the next room which told us that the Emperor had gone back to his reading. At length we heard the sound of a door being opened and a fresh jingle of spurs.

'Then Colonel Lépine's voice: "You sent for me, sire."

'"Yes," came from the Emperor in that caressing tone he used when he was in a good humour; "I sent for you, colonel. I wished to tell you how pleased I was with the behaviour of your regiment yesterday, particularly with that of one squadron which made a very fine charge. I saw the whole affair from Shevardino. You must bring me the officer commanding that squadron."

'"He was killed, sire, unfortunately."

'"Ah, that was a pity. I saw they lost heavily. But indeed, colonel, it was a wild thing for one squadron to make such a charge at all. I suppose you were ordered to send them alone?"

'"Yes, sire," replied my good colonel.

'"By General Latour-Maubourg no doubt?"

'"Yes, sire," Lépine replied again; but there seemed to be a quaver in his voice.

'There was the sound of rapid footsteps, the Emperor flung the door open, and we both stepped from our hiding-place. Lépine moved back a pace as he saw me, and his face turned absolutely gray.

'"Well, General?" questioned Napoleon curtly.

'"He lies, sire!" said my companion angrily. "I gave him no such orders. He knows I did not."

'"Sire," said the colonel in a hurried, stammering tone, "I—I—— It was a misunderstanding. The General did not"——

'"No more words, sir!" burst out the Emperor in a terrible voice. "Name of God, no more! You have condemned yourself. It is now my time to speak. I have heard the story from this sergeant. He says a woman was the cause of it. Now, listen. I do not care why you committed that crime; but I tell you this: you have disobeyed orders; you have lost me a valuable officer and over a hundred men. You have done this purposely in order to obtain your private revenge. For that you should be tried by court-martial and shot. But as I do not wish the story to get abroad in my army I will deal with you myself."

'He stepped forward, his eyes afire. Lépine trembled before him like a hare caught in a trap. The Emperor stretched out his arms, pulled away the colonel's shoulder-straps, and cast them to the ground. "Begone!" he cried; "there is no room for such as you in the army of France. You are no longer in my service. Never let me see your face again." Then, as my colonel still hesitated, he exclaimed in a voice like the hiss of a snake, "Do you hear me? Go, I tell you—go!"

'And so Colonel Lépine, his head upon his breast, stumbled hastily from the room.'

The old man knocked the ashes from his pipe and looked gravely round at his three young companions.

'And was that the end of him?' asked one of them. 'Did you never see him again?'

'Yes,' said the veteran grimly; 'oh yes, I saw him once more. It was during the last days of the retreat, when we had eaten nearly all our horses and just before we reached Wilna. I had fallen behind the wreck of my regiment because I was very weak. Night was coming on, and it was cold—oh, my God, so cold! I knew if I did not find a bivouac-fire soon I should die. As it grew darker I began to stumble over the dead bodies of men and horses, for in those days the Grand Army left a track like a snail's. When I ceased to trip over them I knew I had missed the road and must search until I found it again. I went on doggedly, hopelessly, making faces to prevent my ears and nose from freezing. At last I fell over a corpse and came down with a crash. As I raised myself slowly on my hands and knees I saw the face through the ice film. It was the colonel, frozen stiff and hard as iron. I suppose he had come back from Moscow with the rest of us, though I had never seen him. But there he was, dead, along with thousands of better men. You may think it strange, but I felt afraid of him, and in a way the meeting gave me strength to go forward until I saw the light of a fire belonging to my own comrades, and knew I was saved. So that was the end of him, messieurs, and that is the end of my story.'

SOCIALISM AND CAPITAL.

WHY SOCIETY MUST REST ON A BASIS OF CAPITAL PRIVATELY OWNED.

By A. S. PRINGLE.

SINCE it has become the fashion to discuss Socialism, and since the active propaganda of the Socialists has become so prominent, there has been a great deal of very loose talk on both sides about what Socialism means and what Socialists would do. On the one hand, the Socialist orator explains that under Socialism every one would have work to do, but hours would be short and conditions would be pleasant. Every one would have plenty of nice food and nice clothes; every one would have fine, spacious, sanitary houses, and plenty of leisure and amusement. Some who wish to rouse the passions of the mob declaim against the rich, and give their hearers the impression that when the Socialists come into power they will divide all property up equally amongst the people.

On the other hand, people who wish to frighten every man who owns anything, from a kitchen table and chair to a country estate, tell their hearers that the Socialists intend to confiscate everybody's property in order to hand it over to loafers and degenerates. Socialism is, however, a system of society, and means 'the public ownership of all means of production and exchange, and all capital'—that is, all land, houses, machinery, factories, and every form in which people may accumulate their savings so as to use them in the production of something else. Every one would be employed by Government departments, rent his house from the State, buy his food and necessaries and luxuries from the State. How all the existing property is to be transferred from its present owners to the State, and how they are to be given compensation, if any, is a question which Socialists usually avoid with care; but that question has nothing to do with the principle.

Now, let us contemplate ourselves members of a Socialist State. Two men, A. and B., working at the same job, receive the same wage at the end of the week. A. has expended and consumed all his wages; B. has saved a shilling. On the disposal of that shilling depends whether this State can remain Socialistic or revert to capitalism. If the man may keep his shilling he may buy any commodity he likes with it, and he commences the next week with one shilling's worth of accumulated industry in the form of a commodity; or if he has preserved the shilling or its Socialistic equivalent he has possession of the right to one shilling's worth of work from some one else. Capital is usually spoken of as money; but that is a mere symbol. It really represents things fixed (like houses) or movable (like furniture)—in either case the accumulated product of industry. The Socialist will usually admit that the man may keep his shilling, not seeing what must follow. Next, may he give the shilling to some one else? And, finally, may he leave it by will to his son? Surely he must be allowed to do so; but if he is allowed, then we have one man drawing the result of another's labour even after his death, which is the essence of capitalism.

We then come to the next stage. A man has accumulated his shillings and bought a house. This now represents his accumulated savings as much as any balance in a savings-bank to-day; or he may have bought a sewing-machine or a bicycle. His children grow up and go out into the world; he moves into a smaller house. He may surely let his large house to another man who has not sufficient accumulated savings to buy a house or prefers to invest it in something else. A neighbour wishes to borrow the sewing-machine or the bicycle; is the owner not to be allowed to make a bargain for a payment for this use of his accumulated savings by another man?

We have now reached the length of the capitalist letting out the product of his accumulated labour. The next stage is that a number of men club their savings together to set up a factory. They are now in the position of the shareholders in a limited company. They are themselves all busy working at their own businesses; the factory merely represents their former savings. They can do one of two things with it: either let it out, like the sewing-machine at a fixed price, the hirer taking all the produce and all the risk of the factory being a failure; or they may contract with other men to work the factory, giving them a fixed price for their labour, and, taking all the risk of failure, they naturally get the surplus profits, if any. The first method is what happens where people lend money to other people on the security of a factory; the factory or a part of it really represents the accumulated savings of the lenders, and the owners pay so much a year for the use of it. The second case is the common one of a wages-contract between owner and employé.

These are the inevitable developments of the right of B. to keep the shilling he saved at the end of the week. No free people in a free country will ever consent to have these fundamental principles of freedom of contract abolished,—the Right to Save, the Right to Give, the Right to Bequeath, the Right to make a Free Contract concerning the use of the savings. That is why to talk of State ownership of everything is nonsense as a practical question, unless we are prepared to turn the whole country into a kind of enormous boarding

school, where all men are like the boys, except that there is no pocket-money; their very meals will have to be allotted to them, nor will any man be allowed to save a roll from his dinner lest he sell it at tea-time to his next-door neighbour for an extra lump of sugar.

So far I have tried to explain the true meaning of the existing capitalistic system as we know it. Not only is the admission of private ownership of capital essential to any sort of individual freedom, but the existence of capital—namely, of the accumulated products of industry—is essential to all development of any kind, and as a matter of practice its private ownership is essential to all true material progress.

Whenever any new work has to be undertaken which in the making requires constant application of labour to materials before it is finished and capable of giving a return for all the labour directly and indirectly put into it, a great deal of the accumulated products of former labour must have been used up. For instance, several thousand men worked for seven years building the Forth Bridge. All that time they were clothed and housed and fed, and their families brought up. Some one must have been accumulating the products of industry in order to keep all these people all that time. So also the men who dug up the iron ore, smelted it, welded it into plates, and did all the work which preceded its arrival at the Forth Bridge were provided for by these accumulations. That is expressed by the statement that four million pounds of capital were put into the bridge. The existence of capital, therefore, was essential to build the Forth Bridge. One often hears the Socialist orator talk about the land, suggesting that if men were only allowed to go on to the land they could support themselves in happiness and comfort. But land alone will support no man. Land, the finest quality of virgin soil in parts of Australia and Canada, is 'worth nothing,' there is no market price for it, and any man may have one hundred and sixty acres free, with all its prospective future value, merely being obliged to go and work it. Before the land can begin to support the man he must have ploughs and seeds, horses and sheep; he must build a house, and fence and drain and plant. Even in a Socialistic State all these things cannot be obtained for nothing, except at some one else's expense; they are only to be obtained from the accumulated product of human labour. They are, in fact, the capital which must be expended before the earth can respond to the application of human labour.

Again, the mere production of things will not support any man. He must be able to exchange his surplus for things that he requires. He must, therefore, produce something for which there is a 'market.' A railway without people to travel, a house built where no one wants to live, wheat grown where it cannot be transported to market, a machine which uses up more worth of material than the value of its product—all these things are worthless. But whenever a new country is opened up or a new factory started, a new kind of machinery tried, it is an open question whether the result will not be quite barren, and all the savings of the people who put their 'capital' into the venture lost. The reason why civilised nations allow absolute ownership in these things to the people whose capital is used is that no man would run such a risk and allow his savings to be so used unless he were assured of the full produce if the enterprise turned out to be successful. An excellent example of this principle is found in the history of the great American transcontinental railways. They were built at enormous expense through the vast unpeopled plains of the West and over the mountains to the Pacific shore. But for years there was no traffic to speak of, and the railways did not pay at all. Many of the shareholders were ruined and lost all their savings, while others who had other businesses to support them held on to their shares, believing in the future of the West. The railways, however, had made it possible to open up the land, grow corn, breed cattle, dig minerals, and send these to the markets in the East. Gradually the country filled up, and the enormous prosperity of the West was created by the railways. The shareholders now began to receive dividends; in other words, their accumulated savings which had been turned into the railways began to come back to them. But the Socialist orator, forgetting all about the history of the railways, declaims against them that they are robbing the people who have made their prosperity, forgetting that it was the people who followed the railway, not the railway the people. So, also, in the case of mines, the Socialist says there should be no private property in the minerals because they are part of the actual earth not made by man. They only look at the successful mines, and forget that nine-tenths of all the capital—accumulated savings—which is put into mines is absolutely lost, owing to the great uncertainty of mining and the impossibility of foretelling accurately what will be found. It costs two hundred thousand pounds to sink a shaft to the deep levels in Johannesburg before an ounce of gold can be brought to the surface; so that the accumulated earnings of one thousand people for two years at two pounds a week must be risked to absolute loss on the chance of finding the gold, and even then a slight rise in the cost of working or falling off in the quality of the ore will take away all the profit and make the whole thing a total loss.

In a Socialistic State the Government would require to find that capital—namely, the industrious part of the population would require to support out of their savings one thousand people for two years in order to make this experiment. It is to induce private persons to take these risks instead of making the whole community bear the loss that the State recognises their right, if they are successful, to full ownership of that which their enterprise and the expenditure of their savings has brought to light.

We may sum the matter up thus: Private property is essential to any kind of individual freedom. The ordinary capitalistic system, as we know it, is the inevitable development of private property to each man in his own earnings. Capital is a necessary condition precedent to development; private ownership of capital is essential to the encouragement of enterprise and to secure material progress.

We are all aware—the capitalist or Individualist just as much as the Socialist—of the evils of great wealth alongside of great poverty which have arisen under the laws of private property. The Socialist, seeing those evils, says, 'Abolish all private property,' not realising what the logical conclusion of such a system would be. The extreme Individualist, on the other hand, says, 'Loose every bond which fetters the right of the individual to make the best of himself, give every one an equal opportunity to fight for himself, and each will find the niche best suited for him in the social system.' That extreme view is just as impracticable as the Socialists'. The inherent inequalities between individuals would make the weak but the footstool of the strong. It might breed a mighty race of brutal strength founded upon the crushing of the weak by the strong, as is the law of nature in the lower creation, only that in civilised society as constituted the strong man is often only the possessor of money and the weak the poor. Or the strong may be only the selfish and unscrupulous, while the weak is a man with a conscience. Strength is not necessarily accorded to ability or physical efficiency far less to nobility.

The modern statesman has, therefore, realised that the weak must be protected and the power of wealth for evil must be curtailed; and so we have all those attempts by legislation to provide for the indigent, to help the weak man to struggle against his environment. The owner of capital has often too great a power to dictate the terms on which he will allow of its use; therefore we have factory legislation and such-like to qualify that freedom of contract which as a general principle is essential to liberty and progress. The practical statesman, therefore, believes in private property, but seeks to control it and counteract the evils which come in its train. The Socialist would abolish it, and thereby abolish the main motive of thrift, the main reward of industry, the inducement to individual enterprise, and the sanction which attaches to any penalty on laziness; while he provides no antidote to the inevitable demoralisation of humanity consequent upon taking away the elementary duties of the family—the duty of the father to support himself and his wife and children.

The Socialist assumes that all men are perfect, that the strong will help the weak, that each would do his work to the utmost of his ability for its own sake whether it made any difference to his weekly wage or not, that somehow no one would be favoured, but that each man would be employed in some task for which he was peculiarly fitted. One is inclined to speculate on who would be selected to do all the hard, disagreeable, dirty jobs. It would be well in such a case to have a cousin on the selection committee, or at any rate to keep well in with those wonderful and doubtless incorruptible men. The extreme Individualist, on the other hand, assumes an equality of capacity which is just as ridiculous as the Socialistic theory of humanity. Private property, with well-guarded State control, is the only true *via media* for modern society.

A MOTORIST'S ITINERARY.

ALTERNATIVE MOTOR ROUTES: EDINBURGH TO LONDON.

THE traveller by rail ceases to have any responsibility for his route when set down in a railway carriage save to see that he gets out at his destination. The pedestrian, cyclist, and motorist, moving from one centre to another, must exercise more self-dependence and a good deal more alertness and intelligence in choosing and following out a certain route, in which mistakes can easily be made. If really intelligent, our traveller finds not a little of the pleasure and profit of a journey in reading wisely and well regarding places passed or visited on the way.

Our roads have a literature of their own of growing interest and charm. We have Macmillan's delightful 'Highways and Byways' series, and Mr J. J. Hissey's volumes upon his various driving-tours. William Black's *Strange Adventures of a Phaeton*, which has fallen into the background, is based on a genuine driving-tour. Mr C. G. Harper has illuminated many of our southern English roads, and in his last book writes about the Manchester to Glasgow road. The route-maps available for cyclists and motorists are innumerable and excellent. Taride of Paris publishes what is quite a model book of its kind, *Les Routes de France*, for three francs, for motorists and cyclists.

The great book for coaching-travellers a hundred years ago and less was *Paterson's Roads*, of which the eighteenth and last edition, edited by Edward Mogg, was issued in 1829. This has been called the best road-book in existence, and the foundation of every other work dealing with roads and distances. It was the standard book for army route-marches. Its compiler, Lieutenant-Colonel Daniel Paterson (1739–1825) was Lieutenant-Governor of Quebec from 1812 till his death, and is buried at Clewer, near Windsor. The page in *Paterson's Roads* is in three columns: the route is in the middle column, with distances to and from a place at the

side, while the outer columns give notes on towns and villages and gentlemen's seats which are passed. The old coach-roads are very clearly outlined in the leading map.

In *Chambers's Journal* for 1903, page 687, there was printed the route of certain pedestrians from London to Edinburgh under the heading, 'Cost of Touring at Home and Abroad.' We give here alternative routes from Edinburgh to London, drawn up by an experienced motorist, which differ slightly from those given in most guides, and avoid, where possible, great manufacturing centres, the visiting of which may not otherwise be desirable.

EAST COAST ROUTE TO LONDON.

Edinburgh.	East Retford.
Haddington.	Tuxford.
Dunbar.	Newark.
Berwick.	Grantham.
Belford.	Colsterworth.
North Charlton.	Stamford.
Alnwick.	Wansford.
Morpeth.	Water Newton.
Newcastle.	Norman Cross.
Chester-le-Street.	Stilton.
Ferryhill.	Alconbury Hill.
Darlington.	Buckden.
Northallerton.	Eaton Socon.
Newsham.	Biggleswade.
Topcliffe.	Baldock.
Boroughbridge.	Stevenage.
Wetherby.	Welwyn.
Aberford.	Hatfield.
Micklefield.	Potter's Bar.
Ferrybridge.	Barnet.
Doncaster.	Finchley.
Bawtry.	Regent's Park.

WEST COAST ROUTE TO LONDON.

Edinburgh.	Todmorden.
Stow.	Elland.
Galashiels.	Huddersfield.
Selkirk.	Barnsley.
Hawick.	Rotherham.
Langholm.	Staveley.
Longtown.	Derby.
Carlisle.	Ashby.
Penrith.	Leicester.
Sedbergh.	Harborough.
Kirkby Lonsdale.	Northampton.
Ingleton.	Wolverton.
Settle.	Leighton Buzzard.
Skipton.	Watford.
Colne.	London.
Burnley.	

For the information of motorists who have not yet run over these two routes here given, our correspondent mentions that he thinks the west coast route the most attractive. The only objectionable town to pass through is Huddersfield, which can be easily avoided. On the east coast route, the road between Dunbar and Berwick-on-Tweed is narrow and very winding, with many sharp turns and blind corners. The country is lovely, but the greatest care should be taken on this road, else an end-on collision is possible. He does not recommend Alnwick as a place to stop over night, although the old Lion Bridge over the Aln and Alnwick Castle are well worth inspection. To negotiate Newcastle requires great caution, particularly the steep hill up through Gateshead. It is a narrow road, the traffic is heavy, and there are cobble-stones and a double tram-line. The motorist is recommended to keep a sprag on in case of being stopped by the traffic; it is awkward starting without this precaution. At Chester-le-Street there is another long hill, and both these towns just mentioned are not beloved of motorists. The road by Wetherby is winding, and must be driven over with caution, but it saves going by York, with its narrow streets and crowded traffic.

A world of meaning lies hidden behind the prosaic-looking names and distances of an itinerary to one familiar with the road. Memories pleasant and unpleasant are awakened, on the whole pleasant and belonging to fuller experience and richer life. Mr Augustine Birrell says truly, 'Time cannot stale an itinerary. Stage-coaches, express trains, motor-cars have written or are now writing their eventful histories over the face of these islands; but whatever changes they have made or are destined to make, they have left untouched the mystery of the road, although for the moment the latest comer may seem injuriously to have affected its majesty.'

SPRING.

Down greening hills the chimes of harebells ringing
Usher in spring on wafted melody,
Over the fields there spreads a silver sea
From tender leaves of birch uptossed in singing;
So sings the grass, that leaps with youthful fire
In every throbbing blade that doth aspire
To mate with laughing blossom fair between
The close-set ranks of meadowland; on high
Delicious hangs the May-bloom; near a sky
Of yearning blue, and exquisite, is seen
The morn's clear crystal eye.

From velvet glades the hidden violet stealing
Perfumes the wind that seeks the primrose star;
Anemones stand, delicate, afar,
On mossy banks their slender forms revealing;
Azaleas glow beneath the darker pine,
Ethereal flame of some bright fire divine;
Quenchless, though topped by balls of fragrant snow,
Drooping o'er laden branch of polished sheen,
Sweet-lipped syringas, twined with lilacs, screen
The sun, too fierce, from lilies set below
In sheaths of tender green.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

FROM the high political point of view the four countries that are most interesting to Britain at the present time—those that matter most to her now and will inevitably continue to do so for some years—are the United States of America, Germany, France, and Japan. For the moment the first two in some respects stand on a higher plane of importance than the others. A problem of vast consequence is being slowly and surely worked out as between ourselves and America and ourselves and Germany. In the latter case it seems to have been tacitly agreed that there is not room enough on the face of the earth for these two countries pursuing their present policies and ambitions. Wise men say that a war is inevitable. They may be wrong—we hope so. In the game between Britain and Germany most of the cards are now on the table; that between America and Britain has in a sense only just begun, and each side is speculating upon what is in the other's hand. The thoughts and the acts of the great American nation have necessarily always been regarded with a deep and sympathetic interest by the people of this country. Blood, language, general disposition, and commercial interest have bound these countries together as no others more independent of each other could ever have been. Now there is a feeling that of all the years that any of us have lived through this present one is destined to be the most interesting and anxious one for Britain in her view of the United States. There is a variety of circumstances combining to make it so, chiefly the American disposition towards Japan and the despatch of her fleet to the Pacific side. There is also the general trend of American politics and thought; and there is, as a minor incident, if such it can be called, the presidential election coming on. Now, there was a private dinner-party in London lately, at which there was an American guest of considerable importance, and in the course of the evening there was a conversation across the table between him and an Englishman of corresponding importance, which was pointed to a degree—strictly friendly, of course, but candid. The foregoing remarks were as the premises of this conversation, and the American had opened a contest by suggesting what he held to be certain signs of decadence in the British nation. Thereupon the Englishman, who had much knowledge of what he was talking about, retorted with a view of the United States which is worth reproducing, right or wrong. This is the gist of what he said: 'Europe is losing faith in the American character. In what other country of first-class civilisation in the world is it possible at the present time for the perpetrator of a cold-blooded, deliberate murder to escape from proper justice by means of his cheque-book alone, being a man of no national consequence? I tell you, sir, that that incident damages America in the eyes of her friends as scarcely anything else has done within the last twenty years. It indicated a lack of conscience, of principle, and virtue. We merely smile at your frivolity when we hear of your rich people spending thousands of pounds in freak-dinners and filling your ballrooms with butterflies. We are merely amused at the manner in which your rich families pay prices in money and flesh and blood for foreign titles which as a nation you are supposed to despise. But this other is a more serious matter and provokes more thought. It is a travesty of national justice which, as indicative of a certain national weakness, can only be likened to the Dreyfus affair, incongruous as such a comparison may be in most other respects. Outwardly you are the friends of England; but what is more popular in America than an attack in words upon England? One of the most irresponsible of your public men, but nevertheless a fairly typical American, and one who has ambitions towards your presidency, declared lately, "The deeds of England have always been detrimental to this country, and the intelligent citizens of this nation know that England would be as ready to encourage Orientals to make war on this country to-day as she was to incite the Indians to murder the wives and children of the colonists in

 [*All Rights Reserved.*]

the days of our struggle for independence." Admitting that these words were foolish and a gross exaggeration of American feeling, there is the fact that they were uttered for a political purpose, and that it was shrewdly felt they would be popular. Is the twaddle that you talk about your Monroe Doctrine sincere? Most of your people do not understand it, but believe in it blindly as a religion. It will soon have to be thrown overboard. You remember what Balzac said in one of his stories: "There are no such things as principles, there are only events; and there are no laws but those of expediency. A man of talent accepts events and the circumstances in which he finds himself, and turns everything to his own ends. If laws and principles were fixed and invariable nations would not change them as readily as we change our shirts." That may be simple common-sense—almost a platitude; but it is well that a nation should decently hide its attachment to such a creed. America is at the parting of the ways. This is the most momentous period in her history. She should be the happiest nation on earth; but her riches have spoiled her. She has had one war lately—a little war. If she should plunge into a big one it might do her good as a nation—wars always do a nation good, even though they make it poorer; but she will never recover her old position though she be a hundred times victorious. It will be a new America.' There was a vigorous reply, and then the conversation was turned into another channel.

* * *

The people of towns do really seem to open their souls to the spring when it comes; and never was springtime more welcome than it is this year, after a not very terrible winter, but one that succeeded chilly weather that had been in progress for nearly a year. There is something that is really pathetic in the joy and the ignorance with which spring is greeted by the townsman—the man of the really big and tightly packed city whose little world of still nature is comprised in a plot of clay measuring thirty feet by twenty at the back of his suburban residence. But pale-faced people who see the country-side only rarely are, after all, supremely happy in their nature-loving on the small scale, and they have a true and honest delight in watching the budding of the more or less famous trees that are to be found in sequestered corners of the City, which are regarded as the joint and precious property of the workers there. Into the spirit of spring, then, the townsmen enter most whole-heartedly. Let the sun but shine for an hour through the overhead haze, and the tailors will tell you that there are then certain signs that things are about to 'look up,' for young men—and old ones too—have been in to ask about the spring fashions and to take a look at the spring cloths. The coming of the spring flowers to the big town is one of the events of the year. We were informed lately that a single steamer had carried forty-eight tons of flowers from the Scilly Isles to Penzance, and that thence they had been transported by Great Western train to London for Covent Garden. In these forty-eight tons there were comprised six thousand packages, and these again were made up of twelve thousand boxes of every kind of daffodil and narcissus that the growers know of. It is something of a procession of spring when all these blooms are being wheeled along in great vans, twenty-five of them, to the flower-market at Covent Garden, and a high festival of it when the boxes are untopped and the floral wealth of the Scillies is laid bare. We have said that every variety of these flowers that the growers are acquainted with is thus sent along by boat and railway to decorate the tables of rich and poor alike; and having earlier hinted that there is a pathetic side to this townsman's love for the beautiful simplicities of nature, let it be said that soon after the flowers come up from the islands and the country there are being sold in the streets real flowers of apparent varieties that no grower ever did know of. The flower-faker has been at work, and he has produced specimens that he is able to sell readily and at good prices because he persuades his customers that they are so uncommon, so very rare—rare, indeed! He puts the stems of the bonny yellow daffodils into an aniline dye, and thereafter the flowers are a brilliant scarlet, and he sells them as the rare scarlet daffodils, the like of which, as his customers do not know, never grew from soil. He takes white carnations and again dips the stalks into another solution, and the dye runs through the stem and by a semi-natural process tinges the petals and makes a green carnation—which is a thing that nature never yet has done. The dyed flowers are sold for ten times as much as those that are plain, and they are given fancy names of their own, such as, in the case of the daffodils, 'Enfield Scarlet,' and so forth. To those who are deceived it does not matter much perhaps, but to others who know the truth there is something that is a little revolting in this process of painting the lily. Are all readers aware of the fact that there are constantly flowers produced out of season by chloroforming and etherising the plants until they are, as it were, insensible to the regular order of things, frantically hasten to the ripeness of their life, and then die? Or that from a plant that is not due to flower for a month or so the floral doctor will produce blossoms almost immediately? These processes are simple and certain, and are constantly in use; but so far as we are aware they have not yet been put to any extensive commercial application on account of their expense. We believe that it was a Dr Johannsen of Copenhagen who first experimented with these processes. He had noticed that after a period of repose plants displayed more than usual activity, and his idea, therefore, was to inflict upon them a completer repose than usual, out of the normal season for it, too, and then afterwards to stimulate them in every way possible. So for forty-eight hours he submitted them to the vapour of ether, which virtually deadened

them and suspended their animation for the time being, and after that he placed them in a forcing-house, with the ultimate result that the blooms came in half the time that they did on the unforced plants. Lilacs—and especially a variety known as the Charles X., a difficult one to force—azaleas, lilies of the valley, and others have been treated in this way with the most successful results. Since then Mr T. Jannoch of Dersingham, in Norfolk, has experimented extensively on the same lines, with the result that he showed that periods of from one to two months, according to the plant, could be gained from these processes—that is to say, the very earliest results of forcing of the ordinary kind could be anticipated to this extent by ether, and he himself once triumphed to the extent of producing a laburnum bloom at Christmas.

* * *

And in the spring, too, as has been suggested already, we hear of the fancy of men turning with greater zest than is commonly the case to the question of new colours and fashions—fashions in clothes. If we were to believe half that we are told in the months of March and April we should come to the conclusion that at last there was to come about in the fashionable quarters the long-promised renaissance of the dandy, but the hopes of those who wish for it are doomed very soon to die out again. Britishers are constantly becoming duller and more morose in the matter of their clothes. Their carelessness in this respect seems sometimes to amount to affectation. Perhaps at the present time the average person has too much confidence in the idea that the man is the man for all that—for all the garments in which he may be arrayed—and that his fellows have an extraordinary power of discernment which enables them to see through the poor quality of a stranger's garb to the merits of his mind and character; indeed, it was said by a smart young man, who paid twelve guineas for his simplest suits, of a certain City magnate of colossal wealth and great notoriety for his shabby attire, that his ostentation in this last matter was the height of vulgarity, and there was a good meaning in the remark beyond that which appears on the surface. Many men, perhaps, do not look at the question of dress quite in the way that would be most advantageous to them, and some fancy that the tailors themselves have these matters in their control; but they are wrong. An even commoner delusion is that the King sets the fashion to his people. Probably His Majesty has no desire to influence the sartorial tastes of his male subjects; and it is a curious fact that he certainly does influence the young men of other countries more than he does his own. If it were cabled to Paris that he had been seen wearing a white necktie with green spots there would not be a smart young man who would be happy to be seen in the Bois or on the Boulevards without a white necktie with green spots, and the Paris tradesmen would be in desperation to meet the demand. And so elsewhere. A few years back, when His Majesty was at Marienbad, he appeared constantly in red ties, and instantly the fashion for such was made in Vienna, and it spread rapidly to other Continental cities, where one might have seen shop-windows full of this scarlet neckwear with labels intimating that it was of the manner of King Edward. But it is not the case in London, despite the fact that there is a constant interest in His Majesty's attire. The recent vogue of the Homburg hat is ascribed to the example of the first gentleman; but it is forgotten that the example was set many years ago, and that another example from the same high quarter—one that has been quite as often set on suitable occasions, being those of the utmost unconventionality—in favour of the Tyrolese hat with a feather in it, has been persistently ignored. What also about the tall white hats for summer wear, and the brown bowlers? And the dainty idea of the links that hold the front of a frock-coat? His Majesty introduced the white vest slip, and he is constantly responsible, so it is believed, for such changes as take place in the shape of the black silk hat; but it almost ends at that. Yet it is well known that the King's taste and practice in these matters is the most perfect. Once upon a time we came by some curious and interesting facts, thoroughly authenticated, concerning His Majesty's wardrobe. There is a delusion about, especially abroad, that he never wears the same suit twice, which is manifestly absurd when it is reflected that he generally changes his attire about three times a day, and that, if the story were true, this would mean that he would need more than a thousand new suits in the course of each year, at a cost of upwards—as it has been reckoned by those who know—of ten thousand pounds. The truth is that he has about thirty new suits in each year, and that at Buckingham Palace, Windsor Castle, and Sandringham he keeps a stock of about two hundred of them. When new ones are added to it there are old ones discarded, and these are generally regarded as the perquisites of his two assistant valets. The King has a wonderfully complete wardrobe of suits for wear in the special circumstances of his Continental sojourns; and as on these occasions he does seldom wear the same suit twice, time being short and clothes many, this no doubt is the origin of the legend that has been mentioned. It goes without saying that the workmanship put into all the things that the King wears is the finest of its kind. There is a man in St James's Street who has the honour of making the kingly boots, and he will tell you that he pays fourteen or fifteen shillings to the workman who merely attaches the soles to the uppers!

* * *

There have already been several most entertaining books of memoirs published this year, but none to which the description better applies than to the *Rambling Recollections* of that excellent diplomat, Sir Henry Drummond Wolff, who brings a fine memory and an easy pen to the narration of

some of the most interesting incidents of a great and most varied experience. He is not at liberty to tell all that he knows, but he tells much. There are hundreds of excellent stories that are personal strictly to himself, but some of the best are others that he has picked up in his gossips here and there. There are a couple about Mr Labouchere that are most entertaining. On one occasion, while Mr Labouchere was still an unpaid attaché—most people in these days have almost forgotten that he was in the diplomatic service for a matter of ten years—he was directed to go to Constantinople, and his application for travelling expenses was refused on some petty technical ground. He started, but nothing more was heard of him for several weeks, and the Foreign Office telegraphed half over Europe in search of him, paying particular attention to such out-of-the-way corners as Corfu, where a diplomat might secrete himself. They found him at last at Dresden; and when asked for an explanation he said that as he had been refused his travelling expenses he had had to make the journey to Constantinople on foot, and that at length, exhausted and footsore, he was forced to recover himself at Dresden. The other story concerns the time when he was attaché at Frankfort. He was once playing a game of whist against a very high German functionary, sitting on his left. Mr Labouchere led a small card, and it was a lead that turned out excellently, so that he won the remainder of the tricks. The Minister thereupon remarked, 'Well, Mr Labouchere, you won the game by leading that card; but there was no earthly reason, according to the rules of the game, why you should have done so. You, therefore, have won the rubber by accident.' To which Mr Labouchere answered, 'I had a very good reason for leading that card.' The Minister asked what it was. 'We will have a bet,' said Mr Labouchere, 'that my reason was a good one.' The bet was therefore made that the lead had been justified by the rules of the game. 'Now,' asked the German Minister, 'what was your reason?' Mr Labouchere's reply was, 'I had seen your hand!'

* * *

There was an account in these pages recently of some of those strange coincidences of meetings and events which we encounter occasionally, and are so remarkable that they sometimes make even the most matter-of-fact and phlegmatic person pause to wonder whether they are to be passed as mere coincidences. The account we have spoken of has caused an Edinburgh reader to send to us one of a coincidence with which he was personally concerned, being not less astonishing than others of its kind. He tells of it as follows: 'On a Sunday morning last summer three gentlemen, strangers to me, came to St Giles's Cathedral, Edinburgh, where Dr Cameron Lees gave an eloquent sermon on "The Marriage of Cana." I gave the gentlemen seats beside me. After the service one of them turned to me and related the following strange facts: "Seven years ago we three gentlemen quite accidentally met in the Royal Hotel, Princes Street, on a Saturday night. We all came from Cardiff, but had no knowledge beforehand of each other's movements. We came together to St Giles's on the Sunday morning, and heard Dr Lees preach. Last night we three, without any previous knowledge of what we were severally doing, and without any premeditation, met again in the same hotel. Until then we had not met since the first time seven years ago. We thereupon arranged to come again to St Giles's. We have done so, and we have heard the same sermon—or at least a sermon on the same subject—by the same preacher, in the same place."' Such a coincidence savours of the miraculous.

* * *

We hear almost daily now of the crisis in the diamond-trade, and men who are good authorities tell us that we shall continue to do so for a long time to come. These finest of gems are too dear, money is too scarce, and, what is perhaps more to the point, the people of means do not seem to care quite so much for diamonds as they used to do. For ages they have been the most coveted and costly of all stones, and men and women of pretensions to fashion or riches were not happy unless they made some show of them in their personal adornment. Even so recently as a year ago it was being declared that the demand for diamonds was never so great as then. The change has come suddenly. Financial depression has given many people the excuse to say that diamonds have become vulgar, and that it were better in point of taste to deck one's self with some other less glittering and less expensive gems. But before this came about one did not fail to notice that diamonds were being relinquished by classes of people who had formerly been most devoted to them. A diamond ring on a man's finger is a much rarer thing now than it was fifteen or twenty years ago, and a shirt-stud mounted with one of the stones is comparatively seldom seen. If for a decade or two the gentler sex have been increasing their adornment, the sum of human display has been kept down by the circumstance that the men have been receding farther and farther from a disposition towards dandyism, and rarely in any age or in any country have they thought less of showy personal appearance than they do in Britain at the present time. And once upon a time people used to buy diamonds as a kind of investment; but they do less of that now, and it seems evident that the immediate present at all events is the wrong time to make purchases if any ideas of this kind are entertained, for prices are abnormally high, and dealers in their confidential moments will tell you that they must come down again if the market is to be in any measure restored. Some years ago a good one-carat stone was to be bought for a matter of from fifteen to twenty pounds; but at the present time thirty or forty would be needed to purchase it. Many private persons who bought

cheap are now quite likely selling, or trying to sell, dear, and certainly during the recent financial troubles this has been much done in America, where there is most trade in diamonds. Nothing used to delight the wealthy American so much as to buy the most expensive gems he could discover for the decoration of his lady, and now and again the desire held him to make himself the possessor of some really extraordinary stone which should be handed down through generations as a family heirloom, originated by himself, the founder of his house. But there is also less of this being done; and there is a story abroad to the effect that the embarrassment of a great American firm has been largely due to its having in its possession, and not being able to get rid of, the famous Hope diamond. This diamond had had an eventful history when it was acquired by the firm in question many years ago for fifty thousand pounds with a view to its quick sale at a handsome profit. But it has been lying in the vaults ever since. Possible purchasers have come along from time to time, and considered buying it; but when negotiations were some way advanced a hitch always occurred, and thus the celebrated gem has been lying all this while hidden in the dealer's cellar. An authority to be respected hinted to us recently that it was more than possible that among a large class of people the fear of the future manufacture of diamonds by scientific processes had had the effect of keeping them from placing much money in the natural stones. If there is anything in this suggestion, it seems as if an excess of caution is being exercised by such persons; but, then, never was the virtue of caution so much reverenced as it is to-day, when there seems to be stability in nothing of the old standard of value.

A PAWN IN THE GAME.

CHAPTER XX.—M. DUCLOS AGAIN.

IN the meantime events were occurring in London destined to exert a very disquieting influence on Jack's love-affairs.

Denise had fallen into the habit of long and lonely walks, signs of the distressed mood of feeling in which she lived. She was returning home alone one stormy February evening. The sky was full of black and hurrying clouds; the ill-made pavements were muddy; the air was dark with wind-driven fog. Through a rent in the fog her quick eye caught a glimpse of the figure of a man that seemed oddly familiar, and somehow stirred vague, disquieting memories. The same figure reappeared persistently. Some one, it was clear, was following her. A link, in old-fashioned style, flamed beside the door of her uncle's house, and in its flickering light Denise turned and recognised the dark features of M. Duclos.

'I must talk with you,' he said hurriedly and in suppressed tones. 'I have come all the way from Paris to see you.'

'Come in, then,' said Denise, pointing to the door of the house.

He shook his head.

'They are no friends to me in that house. London itself would be perilous if I were known. You must meet me to-morrow at that address;' and he pressed a folded paper into her hand.

Denise hesitated. She plainly was not anxious to renew her acquaintance with her mother's quondam major-domo.

'You need not fear,' said M. Duclos with a bitter smile. 'This is not Paris.'

'I am not afraid,' Denise answered proudly.

'Come,' he said, dropping his voice, 'if you value your mother's memory;' and without a word of farewell M. Duclos disappeared in the fog and gloom.

In Denise's ears that plea—her mother's memory—was irresistible, and she resolved to go.

It was a street off Trafalgar Square, a neighbourhood even at that time the haunt of foreigners. Denise had to climb one flight of stairs after another till she reached the little room occupied by M. Duclos. Her feelings of distrust deepened as she looked afresh at the saturnine face, the chilly and evasive eyes, of that gentleman. He apologised in half-ashamed fashion for his lodgings.

'Paris is dangerous just now, so for a time I have left it. The guillotine goes too quickly,' he added with a shiver, 'and it is beginning to cut off the wrong heads.'

Denise understood. He had been caught by some fierce eddy in the current of events. His enemies were in power, and he had fled to save his life. Denise offered no comment on this, but asked briefly, 'What have you to tell me about my mother?'

M. Duclos hesitated before he replied. He looked at Denise's face. This was no longer the sensitive child of bygone years; she was a woman, with a woman's wit and more than a woman's courage, and the steady eyes were not too friendly.

'You must have known,' he said at last, 'that there was some tie betwixt your mother and myself. Have you never wondered what it might be? She was my sister, and I am your closest living kinsman.'

Denise was not unprepared for some such revelation. That some unacknowledged tie existed betwixt the two she was sure. But yet, as she looked afresh at the dark face of M. Duclos, and his restless, shifting eyes, she doubted.

'I have only your word for that,' she said; 'and,

sister or no sister, you abandoned my mother when she was in peril, even if you did not betray her.' And Denise's eyes kindled with anger as she remembered.

'Never!' cried M. Duclos with energy. 'She would not be advised. She took her own way, and I had to take mine. It was every one for himself,' he added sullenly.

'Let that pass, then. What is the story about my mother you have to tell?'

M. Duclos hesitated afresh as his eyes dwelt on Denise's face. She had subtly and strangely changed.

'I intend,' he said slowly at last, 'to tell the story my own way and in my own time. But,' he went on fiercely, 'I want money. I can play a great part in Paris still if I have it. These English are rich, and you can get money from them. You are entitled to five thousand pounds, at least, from them. It was in both wills, and they could not refuse to pay it.'

'In both wills?'

'Yes; both in the will that was signed and in the unsigned will. They are robbing you if you have not got that money.'

'Was only one will signed?' asked Denise, who felt that she was groping her way through some mist thick with falsehood.

'Yes; and it gave your mother everything. That young cub was left with only one hundred pounds a year;' and M. Duclos grinned with disappointed malice. 'They must give you five thousand pounds,' he went on, 'if only as conscience-money.'

Denise looked at him with steady gaze.

'On what grounds was the will disputed?' she asked suddenly.

'They pretended that the signature,' said M. Duclos reluctantly, 'was got by a trick.'

'But if the will was good why did you not take it into the courts?'

'Well,' he replied sullenly, 'what chance of justice had a Frenchman in an English law-court?'

'Oh!' cried Denise, 'Robert Lawrence is the most honest man in the world; and if he rejected the will there *was* a trick in it, M. Duclos. And was his son to have only one hundred pounds a year? Then it was a trick to rob the orphan boy. It was a trick, and it must have been yours. You invented it; you were to profit by it. My poor mother was only a tool.'

M. Duclos tried to check the torrent of Denise's anger, but it was in vain.

'I would give you everything if I believed you, and if it would help France. But you want it to help yourself and some dark scheme you have in hand. I will give you nothing. Nay, it is not mine to give. It is stolen money; it burns my very hands;' and she turned away, leaving M. Duclos an image of angry and defeated craft.

Poor Denise! As she hurried, with stumbling feet and white face, down the stairs, she felt that here was a new shame, and this time it was personal. In the background of her mind already was the sense that in her mother's wedded life was some shameful secret that stained the honour and broke the heart of her husband. If that were the case, her relationship with the Lawrence family began in a tragedy. And now it was clear there was added an element of crime, or at least of attempted crime—crime of a sordid sort, with mere plunder as its object. There must have been an attempt to cheat the senses of the dying man and to rob his orphan boy. Poor Jack! And she had been beguiled into taking part of his money!

This, it seemed to the distressed girl, was the wrong repeated in a new and subtler form. That the legacy appeared in both wills conveyed to her mind no clear meaning. In any case, neither will was valid. It was Jack's money; she could not take such a sum from her lover, and after such a history. And yet she *had* taken it. She kindled with what, it must be confessed, was somewhat unreasonable anger against him.

'He ought to have known I could not take it,' she said over to herself again and again. Here was a new shame, and this time it touched herself.

But Denise was a girl of clear intelligence and of rare courage. She kept her own counsel, and showed no outward signs of troubled feeling when she returned. But that night, as the family group sat reading or working by the fireside, she said quietly, 'Uncle, did you prove father's will?'

'No,' he answered in surprise.

'Why was not that done?'

'Well, the will'—and he hesitated—'it was—well—irregular—and so was laid aside by consent. Jack administered the estate as the only son.'

'But could you put aside a will merely on account of some irregularity?'

'Well, my dear, the irregularity was pretty bad.'

Denise was silent for a few minutes. Then she asked, 'What right have I to that five thousand pounds you received and invested for me?'

'Your step-father meant you to have it, my dear. Do you think Jack would not do what his father wished?'

'What did the irregular will say about my mother?'

'Do not trouble your pretty head,' said Robert Lawrence impatiently, 'about a document that was no will at all.'

'Wasn't it signed?' persisted Denise.

'Yes, but by mistake.'

'Did the irregular will give my mother nothing?'

Robert Lawrence grew uncomfortable. 'Don't bring up that ghost of a will,' he repeated.

'Did it not give her everything?' Denise persisted. 'And, if it did, why do you want to put it aside? Why did my mother consent to its being put aside? Oh, you good, dear uncle!' she broke out, 'I know everything. I understand how good you have been. That will was a fraud, a trick,' she went on indignantly, 'intended to cheat Jack. But'—and her voice trembled—'my mother knew

nothing of it. She *could* have known nothing of it. It was the trick of M. Duclos.'

Robert Lawrence doubted the complete innocency of her mother, while his wife had no doubt at all as to her entire complicity; but both respected the girl's confidence in her dead mother's goodness.

She was looking at them both with questioning eyes. 'Don't you believe that?' she asked.

'My dear,' exclaimed Mrs Lawrence with alarmed readiness, 'of course we believe everything you say.'

'That scoundrel,' said Robert Lawrence, 'was capable of everything. But I won't talk about the will any more. It is unprofessional. The whole thing is dead and buried.'

'But I must talk of it. The five thousand pounds is Jack's money, and it is a gift to me. You did not mean it as a charity, I know. But I cannot take it. You are good to me; oh, so good! I shall love you always, and love you the more for the very thing that pains me.'

Mrs Lawrence by this time had her arms round the girl's neck and was kissing her.

'You must let me go,' cried Denise. 'The money would scorch me. I must earn my own living.'

'But if Jack takes back his wretched five thousand pounds, that is no reason why you should leave us,' said Robert Lawrence. 'This is your home. What will Jack say?'

'He has no right to say anything. He has not bought me.'

Mrs Lawrence at this point astonished her husband by saying, 'If your heart is set on it, my dear, you shall go.' She read with clearer insight than her husband the tumult of the girl's feelings.

'One woman,' she said when he reproached her later, 'understands another.'

'Denise does not understand herself,' replied Robert Lawrence in vexed tones.

'That is true, but I understand her. She is sore at heart. Her self-respect is wounded.'

Mrs Lawrence was the most energetically practical of women. Work, she knew, was a tonic even for grief; a succession of fresh incidents and faces, she wisely judged, would serve as a wholesome medicine for the sore mind of Denise. So she set herself to find comfortable lodgings for her, and amongst her friends secured her half-a-dozen pupils in French, music, &c. But Robert Lawrence insisted that he should see the face of Denise at his dinner-table almost as often as ever, and he listened to her exquisite music in the lazy after-dinner hours as frequently as before. Jack Lawrence might find that Denise had moved out of his circle when he returned, but Robert Lawrence would consent to no such loss.

(To be continued.)

ORCA AND DOLPHIN.

By J. O. Byrne.

AUSTRALASIA is developing some curious relationships between its people and certain of the denizens of the deep. Efforts to have the relationships sanctioned and supported by law have been lately made in respect to the orca, popularly known as the 'killer' on the coast of New South Wales, and to a dolphin or porpoise known as 'Pelorus Jack' in New Zealand. In the latter case the law has reached the statute book, and any one attempting to capture or injure 'Pelorus Jack' is liable to a fine of one hundred pounds.

There are many varieties of the orca or grampus, but those chiefly seen about the coast of Australia are the *ater* and *rectipenna*. The orca gladiator is fond of the colder waters to the south, and seldom strays far from polar ice. They are all fierce creatures. They are often referred to as tigers, and for energy, rapidity of motion, and ferocity are well entitled to be so called. But their local term 'killer' has more immediate significance, especially in the whaling industry. That industry is not now what it one time was along the eastern coast of Australia; but still it is followed by a considerable number of persons, and most of the fisherfolk about Twofold Bay, in the south-eastern part, derive their chief subsistence from the capture of whales at certain seasons. It is these who have petitioned the authorities to protect the 'killer' from capture or destruction, and here is the reason.

Whales are, for instance, seen disporting themselves off Waverley or Bondi in the early morning or afternoon. They find good feeding-grounds near the coast as far north as Newcastle. They are playful monsters in their own region, and come so near shore that their gambolling, spouting, and sounding often constitute an exhibition to spectators from the land. Sometimes a 'thresher' comes on the scene and a marine battle ensues. That militant creature leaps into the air and strikes down upon the whale's back with extraordinary force and precision. Both usually disappear on the impact. But in a little the whale is seen to rise in a state of considerable excitement. The 'thresher' is now attacking from underneath. The whale, to escape the attack, imitates the action of the thresher, and in turn leaps out of the water. The entire body of the whale may be occasionally seen above the surface of the water. The sound of the splash of an eighty-foot whale as it falls back into its native element is heard at a great distance, and the commotion is seen in the sea over a large area of foam-capped water. To get rid of his tormentor

the whale instinctively makes for the open sea. In situations such as described he generally succeeds in getting away. He 'sounds' in the deep ocean, and if the 'thresher' follows him the fight is not visible to those on land. This method of escape followed by the whale is just what the 'killer' sets himself instinctively to circumvent. He sets himself not only to prevent escape into deep water, but to drive his enemy into a shallow bay or estuary. The passage outward is, so to say, policed. The 'killers' work in packs. Sometimes as many as twenty join in a single enterprise. They come on a whale disporting himself near the coast, as already mentioned, and proceed strategically to deal wit. him. A cordon is formed on the ocean side, and when he rushes thither he is met by half-a-dozen of his comparatively small but savage enemies. When he attempts to 'sound' he finds a similar pack beneath. They are from twelve to twenty feet long. They spring at him, catch some soft part with their teeth, and hang on like bulldogs. A favourite hold is the lips. Sometimes two or three hang on to a huge, flabby lip at one time. Several vie to catch the whale's tongue, which they tear out if they are able. But they tenaciously cling to any part they can sink their teeth in, and it happens that when the tortured whale springs into the air he is seen to carry with him a number of his enemies fastened to one part or another of his body.

The ultimate object is to drag him to the bottom in shallow water, where they may feast on his carcass. There are several inlets along the coast of New South Wales which seem suitable for this purpose, but the 'killers' have a preference for Twofold Bay; and though they sight the whale many miles to north or south, they strive to drive him to that particular spot. A whale sometimes allows himself to be easily driven. After a few abortive dashes for the open ocean, he takes the line of least resistance and heads for the bay, quite unsuspicious of the fate awaiting him. In such cases the orcas come along behind, intent only on seeing that he makes no unnecessary delay. In the bay are the fishermen in whaling-boats, with lances and harpoons ready. News is generally sent from up or down the coast when a whale in custody of a pack of 'killers' is descried, and the men in the bay get ready for work. It may, of course, be a coincidence that orcas and men work into each other's interest; but I have seen many of these combinations of forces, and can understand why the popular opinion goes further. When the orcas imprison the whale they guard the mouth of the bay and leave the principal part of the killing to the boatmen. They show no fear of the boatmen or their lances or harpoons, some of them drifting around the tossing and plunging enemy with manifestations of enjoyment such as dogs exhibit on the hunting-field when the quarry has been run to earth. At any rate, the fisherfolk are fully convinced that the orcas act in well-understood partnership with them. The orcas' share is the offal and other remains of the carcass when the whalers have removed the valuable parts.

Hence the appeal to the Government to have the orca protected by law from the molestation of persons who do not know its uses. The Fisheries Board of New South Wales has given the subject consideration, but finds its power limited by definitions. The orca is a warm-blooded aquatic animal, and not a fish; and now the attempt is made to have it included under the Act which protects native animals. The word 'native,' however, in the Act is found a stumbling-block.

The case of 'Pelorus Jack' is different, inasmuch as he has been legislated for on sentimental rather than on practical grounds. He is a dolphin of the *Grampus griseus* family, though some little local doubt exists as to his exact place in his large zoological circle. He came from the Antarctic Sea, and is supposed to be the only survivor of a school of dolphins that visited New Zealand in 1848. Whether the rest died or returned to the Antarctic is not known; but for nearly sixty years Jack has stuck steadily to one stretch of sea, and nearly forty years ago began to be noticed for his attachment to certain ships that entered Pelorus Sound. When a ship makes for the Pass, Jack gets in front and spontaneously indulges in a series of rolls, dives, and entertaining gymnastics. He is a large fish, fully fourteen feet long, with a blunt nose and humped forehead. He has a high fin and narrow tail. Because of his colour and the wales or scratches on his back and sides he has been called the 'leper fish.' The colour is bluish white, tinged with yellow, and the excoriations are probably the result of age and wounds, but some defend the use of the word 'leper' on the ground of his having been apparently expelled from his class. Innumerable attempts were made in the early times to hook or harpoon him; rifles have been fired at him; but he enjoyed a charmed life against these attacks. Then came a period in which seamen began to surround him with superstitious reverence. They always encountered him about the same place, he behaved in the same entertaining manner, and manifested the same jovial spirit of friendliness. The seamen accordingly took him under their protection. Moreover, he was found to be a very good pilot. He marked the course of the channel as he conducted his performances. For many years he has been looked for by every incoming vessel, and welcomed as an omen of good luck. Two years ago, although public opinion was strong enough to guarantee Jack's safety, an Order in Council was passed declaring him immune from attack, and placing a penalty on offenders.

THE DEAN'S DILEMMA.

By Edward John Prior.

THE Dean of Tilchester Cathedral sat in his cosy study, surrounded by shelves laden with the books he loved. He was engaged on the draft of one of those sermons in which orthodox truths were cleverly intermixed with much criticism—pointed satirical criticism—of both local and national evils.

These 'social sermons' of the Dean were making him famous. Regarding certain national questions he had occasionally 'said things' which had been deemed worthy of headlines in the morning papers, but his strictures on certain local and parochial affairs had in some cases been warmly resented. A plain man might have thought the Dean to be rather meddlesome, and at this particular time there is no denying that the youths at Tilchester College, of which the Dean was chaplain, and other young men in the town were feeling rather sore about his criticisms. Nevertheless, they loved the Dean, for he possessed certain sportsman-like qualities which made him in most things one of themselves.

He was alone and quiet, for the hour was very late—how late he had not troubled to find out, for he was deep in his work. As his big body bent over the desk, on which a steady light was thrown by a shaded reading-lamp, he looked much older than his fifty years. His hair was gray and his clean-shaven face had many thoughtful lines.

Suddenly he ceased writing, laid his pen down, and sat upright. Faintly he heard the sound of some one stirring in the next room. There was the click of a lock and a light but perceptible footfall. The next apartment was the dining-room, and in the ordinary way no one would be there at that late hour. The household, he knew, had retired to rest some time ago. He sat for a moment and wondered who the intruder might be.

The Dean, though a man of peace, did not lack physical courage. He rose deliberately from his chair, took the lamp in his hand, and threw open the study door. The hall was in darkness, but the Dean became conscious that in the darkness there was something which moved. He turned his lamp round quickly, and saw in the yellow glare of the light a man wearing the broad-arrow uniform of a convict—a young man with a thin, pale face, and eyes which seemed to reflect more sorrow than ferocity.

The Dean started, and then a smile crept to his lips—an inscrutable smile which would have told the convict nothing even if he had seen it. 'You have escaped from the jail,' the Dean said. 'You have—er—burglariously entered my house seeking to find food and clothes and anything else. A veritable thief in the night. Isn't that so?'

The man's voice was hoarse. 'Only food and clothes,' he murmured; but'—— He paused and looked around.

'Come in here,' said the Dean, seized with a sudden inspiration.

'Perhaps,' said the man, 'if you will let me go I'll make no trouble.'

The Dean drew himself up, fiercely restraining a desire to laugh. 'No, no—I insist,' he said. He stepped back, still holding the lamp aloft, and the man, after a quick, nervous glance to right and left, followed him. 'Sit down.' The Dean succeeded in making his voice firm.

Again there was a nervous hesitation on the part of the convict; but he did as he was told, sinking into the Dean's easy-chair with the air of a tired man. 'I don't know what you intend to do,' he said; 'but I have taken none of your property. Give me some refreshment, and, if you will, let me go out into the night again. I ask you not to give me up, but I—I expect you will. Give me something to eat, and if you will you can then call for assistance.' Having spoken, the man closed his eyes with the air of a man who is a stranger to sleep.

The Dean took a box of biscuits from a sideboard. 'Eat some of these,' he said, 'and if you will promise not to move I will fetch you something more appetising.'

The man nodded readily and helped himself to a biscuit.

As the Dean left the room his smile came perilously near to a chuckle. In a few seconds he returned with a cold chicken, some bread, and a bottle of wine.

The man murmured his thanks, and attacked the food with an amount of vigour which even the Dean found astonishing. Meanwhile the latter made himself busy with a corkscrew.

'Admirable!' he said to himself. He sat down and drew from his pocket a crumpled note which had been delivered the previous day. As he read he nodded and smiled, and occasionally he turned one twinkling eye upon his visitor, who seemed to recognise that he was in the hands of a superior force.

'What is the time?' asked the man presently, pushing away the plate from which he had partaken of a substantial meal.

'I'm afraid it is late,' answered the Dean, consulting his watch. 'A quarter past two, to be precise. I have a weakness for late hours.'

'To which weakness, coupled with more admirable qualities, I owe my excellent supper,' said the man with a calmness which was remarkable.

The Dean coughed. 'I'm afraid,' he said, replacing the letter in his pocket, 'I'm not quite so disinterested as I seem.'

The man gave him a quick glance. 'Ah! you have telephoned to the police, then?'

'No, no.' The Dean extended his hands. 'You quite misunderstand me. I haven't a telephone in the house, and to call a servant would—er—rather interfere with the carrying out of my object.'

The strange visitor stared at his host. He also glanced at the door. It was locked.

The Dean observed him closely. 'Yes,' he said, 'I have ventured to lock the door for the sake of privacy; also, to discourage any desire on your part for an immediate departure. I do not think you are quite yourself to-night, and you might be rash enough to run out into the night again. With those clothes you are wearing you might excite some serious misunderstanding in the breasts of ordinarily peaceful citizens.'

The man stirred uneasily. 'Pray tell me your little—your object in befriending me so far. Unless I misjudge you, sir, you are not the man to delight in torturing a fellow-creature; least of all when that fellow-creature happens to be a hunted convict, innocent of the offence for which he was convicted.'

Again a ghost of a smile played round the features of the Dean. He found the phrase a 'hunted convict' singing in his ears. 'Not at all,' he said; 'but am I wrong in presuming you to be an educated man?'

'In that you are correct,' was the reply.

There was something in the man's manner of speaking which appealed to the Dean. 'He is really admirable,' he murmured to himself. To the man in the chair he said, 'Your being an educated man may help you to appreciate, even though your views have been somewhat narrowed recently'—he dwelt fondly on the words—'what is in my mind. You may possibly have heard of me. I am the Dean of Tilchester Cathedral.'

The man nodded politely, but his eyes retained that curious expression of mingled sorrow and indifference which so interested the Dean.

'As the Dean of Tilchester,' went on the reverend gentleman, 'I am brought into touch with all sorts of people. Please don't think I am saying anything personal now. Some of my duties are not pleasant, but you will understand they are duties and therefore not to be disregarded. I make a point of knowing all my congregation personally, or as many as I can get to know; and recently, as even you may have heard, I have been preaching a series of sermons and giving lectures—portions of which have been reported in the newspapers—designed to throw light not only on burning social questions, but on some of the lesser weaknesses of mankind. These sermons have brought some popularity in certain quarters; in other quarters they have, I fancy, made me rather notorious. In my own district here they have given rise to a good deal of talk. I don't wish to weary you, but I desire to make my position quite clear. Please understand that I always endeavour to act conscientiously.'

The man in the chair nodded wearily. He also looked at the door and the window. The Dean pretended not to notice.

'As an instance of my thoroughness—I always pride myself on doing things thoroughly,' continued the speaker, smiling inscrutably—'I may mention that the male youth of this district (I must confess they are a somewhat turbulent youth, given at times to wild talk and even wilder doings) have recently taken exception to some of my—er—criticisms on a questionable form of entertainment which they have thought fit to indulge in. I am referring to private theatricals. Private theatricals, I agree, may serve a very good purpose; but when they are given over to pandering to the crudest sensationalism—the kind of stuff errand-boys delight in—I am opposed to them. As all these young men are really very good at heart, it has pained me that they should seek to ape villains and scoundrels. In fact, I said it would be impossible for them to achieve any success in this line; but, such is the perversity of human nature, this particular criticism has hurt them more than anything else. But I merely mention this in passing.'

The man did not move. He sat with his gaze fixed on the Dean's bookcase, evidently listening intently.

With twitching lips the Dean proceeded: 'So much to explain some of my difficulties. Now I will come to the point. When you arrived here—I think it was by the dining-room window you elected to come—I was engaged on one of my social sermons. I was dealing with the case of a man who might be down in the world—such as you are—but yet who was not wholly insensible to good influences, as I trust you are not. It occurred to me that you might be able to give me some valuable assistance. Pardon me if I say that I look upon you as a valuable human document, as one who is fallen but not lost.'

A wave of colour swept over the man's face. As the Dean observed it, the ghost of a smile once more played round his lips.

The convict moved uneasily. 'What is it you want?' he asked.

'Just this,' said the Dean. 'Tell me briefly whether, in your heart, you, who know much of crime, do not think I have acted rightly in making this stand against the popularising of crime, even if I have employed gentle sarcasm which may have wounded some vain youths who think—who think they can emulate those steeped in crime.'

For the moment the man looked perplexed. 'What are you going to do with me?' he asked.

'That will depend on the frankness of your answer,' said the Dean.

The man held up his hand. 'You may take it from me, sir, as my firm opinion,' he said in his low, weak voice, 'that you are doing quite right,

and that these young fellows are fools if they don't appreciate what a jolly good parson they happen to have. I have met a good many parsons, but'—with a look at the empty bottle—'never one like you before.'

The Dean smiled. 'He is really excellent,' he murmured to himself. 'Do you,' he asked, 'mind writing those words as a—a memento of your visit? Of course, in the circumstances, I should not ask you to sign your name.'

The man hesitated, and then took the pen and paper handed to him and wrote what amounted to a testimonial for the Dean.

The Dean read the paper and carefully folded it. 'Thank you,' he said. 'Now, what can I do for you?'

'I—I feel I have been dreaming,' said the man, possibly influenced by the Dean's burgundy; 'but if you are playing it straight I should ask for a change and safe opportunity of wishing you "good-morning."'

'You shall have both,' said the Dean. 'Pardon me one moment.'

As he left the room—the door of which he left wide open—the Dean murmured to himself, 'Admirable!' nor did he try to keep back the smile then. It occurred to him that the man had readily adapted himself to circumstances. If he had been familiar with the stage, as he was not, he would have said the man had 'taken every cue.'

Left alone, the man looked around in a manner which betokened bewilderment. What he said to himself was, 'Well, I'm blessed! He's as mad as a hatter.'

The Dean returned promptly. 'These are all I can lay hands on,' he said, producing a very old clerical suit, a pair of boots, a collar (which fastened at the back), and a round felt hat. 'I think the—er—disguise will be perfect.' Again the Dean smiled, but it was hardly the smile of a good Samaritan. He had an entertaining vision of his visitor dressed in that rusty suit being compelled to walk in the light of day (for the dawn had broken) through the streets of Tilchester.

But if the man had any qualms on that point he concealed them. Indeed, he rather astonished the Dean by his ready and grateful acceptance of the clothes. With the round felt hat he appeared particularly pleased. Like a methodical person he proceeded to make a bundle of his prison clothes.

'I will see that they are locked up somewhere,' said the Dean.

'Better destroy them,' remarked the man.

'Perhaps so,' said the Dean, looking vastly amused. 'At any rate, you will not be able to take them with you.'

The strange guest agreed, and was escorted to the front door by the Dean, who remarked, 'As a rule I don't think I am credited with a sense of humour.'

For the first time the man grinned. 'You have more than that,' he said, and strode down the path with a smart, firm step.

'He keeps it up admirably,' said the Dean, watching his movements.

Then he went back to his study and laughed—laughed till the tears rolled down his cheeks. 'I really believe he thought he took me in,' he muttered; 'but forewarned is forearmed. With these things'—he fondly tapped the testimonial and the discarded clothes—'in my possession I don't think he will appreciate the joke. It was really good of Arthur to let me know.'

He again took the letter from his pocket and re-read it musingly:

'Tilchester College.

'Dear Uncle,—Just a line about those theatricals. As you know, the fellows do not take your criticism at all kindly, and they are determined to play *The Hunted Convict* with realistic effects. We have a fellow down from London named Murray—he is a first-rate amateur actor, and belongs to a Tilchester family—and he is to take the part of the convict. What I want to say, however, is this: in consequence of your remarks about their abilities, they are arranging a rather bad practical joke—namely, Murray, dressed in prison clothes, is going to get into your house and ask for assistance as an escaped convict. The other fellows are to be about in case anything goes wrong. There is a wager on, and if Murray gets through all right he will make a bit. (Excuse my slang.) I have only just heard of this, as the fellows did not like to let me into the secret. I really think it is going too far, as a chap dressed as a convict might give Aunt Mary a bad fright.—Your affectionate nephew,

'Arthur Lawson.'

The Dean of Tilchester went to bed with a happy smile on his face, and even forgot to dream.

. . . . . .

When he put in an appearance at the breakfast-table he did not look like a man who had been keeping late hours. The thought that he had got even, in his own way, with some of the turbulent youths of Tilchester, who were content to take learning but not moral guidance from him, was a source of great satisfaction.

As his wife was in delicate health the Dean breakfasted alone, and relieved the solitude of his meal by an occasional laugh. Over his second cup of coffee he read his letters, as was his custom. He saw that one was in his nephew's handwriting, and he turned to it with an amused smile.

But the smile disappeared as he read. The letter ran:

'Tilchester College.

'Dear Uncle,—A few words to say that you need have no fears about the proposed joke. The presenting of *The Hunted Convict* has been abandoned, as Murray sprained his ankle rather

badly a few days ago. As soon as he is well he will have to return to London, where he is due for an examination, so there will be no opportunities for rehearsal. None of the other fellows are equal to the part.—Your affectionate nephew,

'ARTHUR LAWSON.'

The letter dropped from the hand of the Dean on to the carpet. An ashen colour stole over his face, and he had a feeling of being suddenly unwell.

Mechanically he put out his hand and grasped the fatal letter again and quite convinced himself that he was not dreaming. Not a joke after all! What had he done?

He rose unsteadily and walked to the door. Reason prompted him to go to the study and make sure that the much-valued mementoes of the midnight drama were safe under lock and key. He fully realised that on any occasion of this sort great presence of mind was required.

In the hall he encountered a maid. Noticing an unusual pallor about his cheeks, she inquired whether she could bring him anything.

'Bridget,' he faltered, 'I am going into the study to—to work. I don't wish to be disturbed on any account.'

Later in the morning the first edition of the evening paper was laid on the Dean's table. His hands shook as he picked it up. On the front page, in glaring type, he read:

'DARING ESCAPE OF A CONVICT FROM TILCHESTER JAIL.'

There followed some meagre details of a warder being surprised and a bunch of keys taken from him. There was also a personal description of the convict in question, who, it seemed, had been sentenced under the name of Thomas Brown to a long term of imprisonment for forgery. The Dean found that the descripton was painfully accurate.

. . . . . .

During those days in which the hue and cry continued the Dean suffered great mental agony. That part of him which was a law-abiding citizen and a clergyman came into violent conflict with the more human part. He was in a terrible dilemma as to what, in the circumstances, he ought to do. His ultimate decision to do nothing except take a much-needed holiday was confirmed through the agency of the postman. One morning he received a parcel containing an old suit of clergyman's clothes and an unsigned letter bearing a foreign postmark, in which he was warmly thanked for his timely assistance to a gentleman in distress.

THE MONTH: SCIENCE AND ARTS.

A REMARKABLE LOCK-IMPROVEMENT.

THOUGH the lever stands to-day as the universal lock, and has successfully defied all efforts to supersede it, yet it possesses certain shortcomings which have always been appreciated, and which become accentuated in the commoner types of locks where good workmanship is sacrificed for cheapness. These weaknesses are of an inherent nature, the greatest being the ever-existing liability to overshooting, rendering release a difficult process. The principle of the design is familiar to all. The lock-plate—that is, the part which slides into the catch—carries a solid piece at the end where it slips into the case. The other end of the plate is cut away to admit of the insertion of the necessary levers, which are placed upon a short stump, and about which they move, forcing the bolt to and fro. This short stump constitutes the vital part of the mechanism, and it is obvious—inasmuch as it is fixed at only one end in the lock-plate—that should this stump be bent, twisted, or loosened in its bearing the whole of the mechanism becomes deranged. The failure of this stump means the collapse of the lock. Attempts to overcome this drawback have been made from time to time, but no decided success has been achieved until recently. An inventor has now evolved a new system of construction; and, although the fundamental principle of the lever-lock is still retained, its character is so changed and improved that failure is impossible. Instead of making the bolt solid only at the head, he has made it hollow. Within this recess the levers are packed and held firmly in position at one end by a pin which passes right through the hole from one side of the case to the other. While thus providing the lever mechanism with a substantial pivot upon which to work, it also gives the latter a support at either end. Consequently it is impossible for the levers to be brought out of alignment, as this pin cannot be thrown out of position by constant use or force. Overshooting is thus entirely obviated. Moreover, additional security and strength are obtained, and picking is rendered more difficult. The principle of construction also facilitates the general overhauling of the lock when desired, while the lever system can be easily and quickly changed whenever required. The Margewood lock, to quote its title, can be adapted to any purpose to which the ordinary lever-lock is applied, the factor of great strength being equally present in all, from the smallest to the largest types. Taken on the whole, it must be conceded that this modification constitutes the greatest improvement in lock-designing since the invention of the present-day lever-lock by Barron some hundred and thirty years ago.

A NOVEL TYPE OF PETROL-MOTOR.

We are all familiar with the twin-cylinder type of motor which is generally used for the equipment of motor-cycles, in which the two cylinders are disposed V-fashion to act upon the same crank, by which arrangement an extra cylinder is secured without increasing the width of the crank-case. This principle has now been carried to a far greater extent by Mr Robert Esnault-Pelterie, the invention being discovered in the course of his experiments in mechanical flight. In this ingenious motor the number of cylinders arranged upon the same principle as the twin-cylinder cycle-motor engine—that is, star-fashion upon the upper half of the crank-case—is increased to five and seven, giving twenty and thirty horse-power respectively; while by arranging two such rows side by side, whereby the width of the crank-case is doubled, he can secure ten and fourteen cylinder engines developing forty and sixty horse-power respectively. The result of this arrangement is that an even and regular turning movement is given to the crank-shaft, while an appreciable economy in the weight of the engine is effected by dispensing with the fly-wheel, which constitutes one of the heaviest parts of the motor. The arrangement of the cylinders upon the cranks is ingenious, while he has also evolved a novel combined inlet and exhaust valve-system. The motor has been subjected to a number of severe tests, and has proved remarkably efficient. For aeronautical purposes it will no doubt be in great demand, for which the great saving in weight which is obtained—the seven-cylinder thirty horse-power model weighs one hundred and fourteen and a half pounds—combined with the small space occupied, renders it eminently suitable; but these features will undoubtedly result in its application to other purposes where a light, compact engine developing great energy is required.

AUTOMATIC WATER-FINDER.

One of the latest remarkable applications of automatic mechanics is the automatic water-finder, a scientific development of the divining-rod. The deficiencies of the last-named have long been known despite the successes that have been achieved therewith; but the new appliance is stated, as the result of several tests in the hands of well-known engineers, to be infallible in its action. The device is extremely simple, comprising a small magnetic needle, similar to that of the mariner's compass, mounted in a small box which is carried on a tripod. When it is put in operation, the presence of subterranean sources of water is immediately betrayed by the violent agitation of the needle, the oscillation in some cases being as much as one hundred and fifty degrees. Unlike the old-fashioned and primitive divining-rod, the appliance is not affected by other influences than those of water, which consequently renders it absolutely reliable in its action. Moreover, in prospecting for water, a fair estimate as to whether the sources available are sufficiently adequate to warrant boring may be gathered from the degree of the needle's agitation; while should no water be existent the needle remains absolutely stationary. Being of simple construction there is little likelihood of the apparatus becoming deranged, while at the same time it is of sufficiently strong design to withstand the rigours of transport over rough country. The instrument has been subjected to several experiments by water-engineers and divining-rod experts, and has met with conspicuous success.

AN INGENIOUS LOCK-NUT.

The more extensive employment of high-speed machinery, with an attendant increase in vibration, which has a tendency to permit nuts to slacken back, has resulted in inventors striving to overcome this danger by a variety of ingenious means. Several novel types of lock-nuts which cannot possibly become loosened by vibration have recently been placed on the market; but the latest is particularly efficient, since, unlike the majority of such security-devices, it will lock the nut either way. In this latest arrangement the two nuts are placed on the bolt together, but when the securing-nut has reached the desired point the upper locking-nut can be further revolved to a limited degree. This is accomplished by providing the lower face of the lock-nut with a lip which slips into a circumferential recess on the upper face of the first nut, the joint being of the dovetail type. There is a distinguishing mark on the two sections to indicate when the thread on each side is in alignment, and the nut can then be removed as a whole. By screwing down the top nut a little more, however, a cross-thread is obtained which contracts the lip of the upper nut, and thereby produces a circumferential grip rendering the whole impossible of removal. The advantage of the system is not only the securing of a tighter grip upon the bolt, but it is achieved without bruising the thread in any way, while the nut will not wear, so that it can be used for months.

OIL-DRIVEN HERRING-DRIFTERS.

Steam herring-drifters have been in use for many years past, and their numbers have increased rapidly during the last decade. They possess the great advantage of being able to market their catch long before the sailing-vessels reach port; but a steam-engine and boiler takes up a good deal of valuable space which would otherwise be available for the storage of fish; consequently steam-drifters have to be much larger and heavier than sailing-ships of the same carrying capacity. An attempt has been recently made to combine the advantages of both types of vessel by the addition of an oil-engine to a sailing drifter. From the particulars given of this novel fishing-craft we gather that, although the length of keel is only sixty-eight feet, she has the same carrying capacity as a steam vessel measuring eighty-five feet in length, the speed

being about eight knots in either case. The oil-engine is rated at eighty-two horse-power, and is started by means of a smaller engine, which also serves to operate a combined capstan and windlass. Both the main and starting engines are run on petrol for the first few minutes until their carburetters become hot enough to vaporise paraffin, when by one movement of a handle petrol is shut off and paraffin turned on. Although oil fuel is more costly than coal, it is anticipated that the decreased cost of attendance and the greater carrying capacity will more than counterbalance this disadvantage.

A CRAWLING MOTOR-TRACTOR.

Some months ago the trials of the ped-rail traction-engine—an engine equipped with a number of feet placed around the periphery of its driving-wheels, thereby imparting a walking action—aroused considerable interest. Now, however, an improvement has been effected upon this principle. The latest machine of the four-wheeled type has a wide, heavy chain passing around the front and rear pair of wheels on either side. When the engine is set in motion the revolution of this chain causes the engine to crawl, as it were, along the ground at a high speed. The advantage of this system is that owing to the great extent of the adhesive surface presented by the chain the tractor can secure a greater purchase upon the ground, thereby enabling it to travel over the roughest and most broken country with ease. It is impossible for the chain to revolve idly in the air, since some portion is bound to be brought into contact with the ground at one point or another. In appearance the tractor certainly is somewhat cumbersome and unwieldy, but at the same time it is a most useful apparatus, especially in view of the high speed which it can attain and maintain. The engine for several months past has been subjected to the most severe trials by the War Office upon the broken country surrounding the Aldershot military centre, and has proved highly successful—ditches, rocks, swampy ground, and sandy soil offering no serious obstruction to its progress. It should prove a highly valuable acquisition for farm-work, especially upon the extensive ranches in the colonies, where the country is often of a rugged nature and bare of any but the narrowest footpath tracks.

A NEW MOTOR-FUEL.

A novel contribution to the motor-fuel problem has been made by two German investigators. This is an acety-alcohol vapour composed of the combination of the gases of acetylene and alcohol. According to their process, denatured alcohol is vaporised by means of an ordinary benzine vaporiser, and the resultant gases are conducted through a cell containing dry calcium carbide. As the alcohol gases always contain a certain proportion of moisture, the contact of this with the calcium carbide immediately sets up a chemical operation resulting in the generation of acetylene gas, and this combines with the alcohol vapour. The gaseous mixture then passes to the combustion-chamber and is ignited in the usual manner. It is stated that vapour such as this has not only a potential explosive effect, but also a high calorific value, while the passage of the alcohol vapour over the calcium carbide serves as a dryer to the former, improving thereby the value of the gas, while similarly the proportion of acetylene varies according to the percentage of moisture contained in the alcohol vapour.

FROZEN MILK-SUPPLY.

One of the latest methods of supplying milk in order to meet the demand for purity and freedom from bacteriological contamination is being practised on the Continent. It is to retail the liquid in a frozen condition. For some time past there has been a tendency among the advocates of a pure milk-supply to emphasise the greater advantages arising from preserving this article of food at a low temperature rather than submitting it to scalding. Whether such be the case or otherwise, experience at any rate proves that pure milk when frozen will retain its original properties for several weeks unchanged. Unlike scalding, a frigid temperature causes no change in the taste of the liquid; while, moreover, the cream, instead of collecting upon the surface, as is the case when milk is permitted to stand under ordinary conditions, remains diffused throughout the whole bulk. Investigation has also clearly established the fact that by preserving the liquid in a frozen condition the number of bacteria is appreciably diminished.

RATIONAL METHODS OF DEALING WITH PRISONERS.

Cleveland (Ohio) is at present offering an object-lesson in rational methods of dealing with its human wreckage—prisoners, and those who have no available resort of an evening save the public-house. Much remains to be done in Britain in utilising convict-labour for various useful public purposes, and much also in the way of prevention. How Cleveland has solved the problem is related in an article in the New York *Outlook* for 18th January 1908. Hundreds of men committed for vagrancy, assault, drunkenness, and various petty crimes have been transformed into law-abiding and useful members of society. Cleveland colony, where the experiment has been going on for seven years, occupies a commanding site of about three square miles, laid out by an expert architect and landscape-gardener. In the centre is an administrative group of buildings, with shops and places for the employment of the city's human wreckage. There is an infirmary group and a consumptive group of buildings; at the workhouse group petty offenders from the city are housed and employed in farm-labour, kept from temptation, and afforded a fresh chance. On the farm colony of nineteen hundred acres the prisoners, entirely unguarded, are employed in draining land, making roads and sewers, working in stone-quarries, and doing ordinary farm-work. Formerly

they were locked up in the workhouse, and set to pulling brushes, with indifferent results; now the discipline, open-air occupation, and regular food make men of them. There is a Brotherhood, worked entirely by the effort and at the expense of the discharged prisoners, which lays hold of discharged prisoners and protects them until they procure some occupation. 'Boyville' is another scheme, where boys accused of petty offences are sent to homes and trained. Dr Harris R. Cooley, director of charities and correction, has brought about this revolution in Cleveland.

INCREASING POPULARITY OF CHESHIRE CHEESE.

For some years past Cheshire cheese, which formerly constituted such a popular feature of the table, has been somewhat under a cloud. Now, however, signs of a returning vogue are present, which under the circumstances is not surprising in view of its high nutritious qualities. The reason of its decadence is somewhat difficult to comprehend, but it was no doubt influenced by a certain faddism which to-day characterises our dietetics. The novelties of gruyère, stilton, and the French cream-cheeses for a time appealed to the palate; but in nutritious value they do not compare with the product of Cheshire. In certain circles it has been stated that the decline of the edible has been solely attributable to the antiquated methods pursued by the makers, who refused to come into line with modern developments. However, it is a healthy sign that there is a revulsion of feeling in connection with modern manufacturing processes, owing to the many opportunities that exist for combining and working up deleterious products into a highly attractive finished article. The Cheshire cheese-makers refused to fall in with the modern tendencies, and their determination in this matter has proved to be justified. To-day Cheshire cheese is rapidly regaining the lost ground, and although it has two strong competitors in the popular cheddar and the Canadian products, both of which are extremely wholesome and of excellent quality, its palatability and flavour will ensure it a wide popularity.

A THRILLING AMUSEMENT.

In past years we have had several sensational amusements invariably associated with exhibitions, such as the water-chute, big-wheel, topsyturvy railway, and others whose names are legion; but a distinct novelty will be available to lovers of the thrilling at the Franco-British Exposition of this year, and the interrogation, 'Have you flip-flapped?' will no doubt become a catch-phrase. This sensation will comprise two huge tapering steel towers, weighted at their lower ends, where they will be carried on an axle. The two towers will be entirely independent in their action though working together in opposite directions simultaneously. At the upper end is to be placed a small carriage or miniature pavilion, which also will be pivoted to the tower. Normally these arms will repose practically in a horizontal position, being anchored to landing-stages. The sensation comprises being swung slowly from one landing-stage in a semicircle and deposited upon the opposite anchorage. In this passage the pavilion will retain its vertical position by swinging on its axis, and half-way through the journey the passengers will be poised one hundred and fifty feet or more in the air. The two arms will flap in opposite directions simultaneously, and in view of its novelty the sensation will no doubt prove a great attraction.

INTERNAL-COMBUSTION ENGINES FOR LOCOMOTIVES.

The widespread development of the gas-engine in one or other of its varied forms has during the past few years resulted in its attempted application as a prime mover to many forms of locomotion. Among these is the locomotive; but the difficulties to be overcome have been such as to prevent the schemes from being carried to any practical conclusion. It has recently been announced, however, that one of the leading locomotive-builders on the Continent has at last solved the problem in combination with compressed air. The system comprises the provision of an air-compressing cylinder mounted on top of the combustion-head of the explosion-cylinder, the two pistons being rigidly connected together by a rod. Some of the compressed air is admitted into the combustion-chamber of the explosion-motor, but the bulk is conducted to larger cylinders similar to the steam cylinders of the locomotive, the piston of this cylinder being fixed to the connecting-rod of the axles of the driving-wheels. The object of storing the compressed air is twofold. When the engine is stationary and the compression of the air is still being continued, the pressure thus secured will serve to overcome the inertia of the engine in starting, the driving action subsequently being taken up by the internal-combustion motor alone. Also, the storage of the compressed air in the cylinder will afford a ready means of starting up the motor when cold. The development of this idea will be followed with great interest; but it is a doubtful point whether it will become of any practical commercial utility, since the steam locomotive has been brought to a high standard of perfection.

NEW RAILWAY-TANK FOR CARRYING ACIDS.

A new and special type of tank has recently been placed on the market for the carriage of dangerous fluids such as hydrochloric acid in bulk over railways. Owing to the powerful corrosive action of this acid upon steel a special acid-resisting medium had to be evolved. In appearance the vessel resembles the ordinary type of small coal-wagon of very massive construction. The outer wall is built of red deal, tongued, grooved, and dovetailed at all joints. The interior surface of this wall is coated with a mixture of boiled pitch and tar, upon which is then laid a skin of acid-resisting felt, which in turn receives a coat of the pitch and tar. Inside this is placed an intermediate casing of red deal three inches thick,

double-grooved, tongued, and also with dovetailed joints, all the latter being sealed with a secret adhesive produced by the builders. All bolts and screws have their heads well countersunk and covered over. Within this double-walled receptacle the tank for the acid itself is placed. This is built up of deal fitted in a specially ingenious manner, nails, screws, or pegs being entirely dispensed with. Before being fixed together the component wooden parts are subjected to immersion in a steam-heated bath, so that the pores of the material may become thoroughly impregnated with paraffin-wax. When this inner tank is slipped into position in the wagon the space between it and the intermediate casing is completely filled with a compound of boiled pitch and special dry clean sand, prepared for the purpose, which sets into a solid mass, tough and solid but not brittle. The orifice provided in the roof of the innermost tank, by which it is charged and emptied, is fitted with a stoneware manhole screwed down tightly into position to prevent any possibility of leakage arising from oscillation when in transit. It will thus be realised that the wagon is of substantial construction, and as it coincides with every requisition necessary for the conveyance of such a corrosive liquid it should become widely adopted, especially as the transportation of such material in bulk is far safer and more economical than by the carboy system, where breakages and losses are of frequent occurrence.

AN INGENIOUS TIME-RECORDER.

The installation of devices for recording the time and departure of employés in our large manufactories has now developed into an indispensable part of the equipment of an establishment. Unfortunately there are hundreds of small firms where the use of such an instrument is precluded, though some such apparatus is desirable. To fulfil these requirements a special type of time-recorder has been evolved. The apparatus is very small and compact, measuring only some sixteen inches in length by twelve inches wide and seven inches deep. In general appearance it resembles the type of cash-till in which purchases are recorded upon a revolving ribbon of paper, and which moves forward one division every time the till is opened. In this type of time-register the use of numbers is dispensed with. Instead, the arriving employé records his signature upon a roll of paper, there being a small aperture provided for the purpose in the face of the instrument, while in the same line as the signature the time of the hour and minute such operation was performed is recorded in ink by a stamping mechanism controlled by a clock fitted into the case. In this manner an infallible record is secured, and the difference between A.M. and P.M. is effected by the hour-figures of the former being printed in Roman numerals and the latter in italics. It is impossible for the mechanism to be tampered with or deranged, so that the possibility of the records being incorrect is completely removed.

CARRAGEEN—ROASTED WHEAT.

The article on carrageen (Oct. 1907) has moved Sir Alexander Muir Mackenzie to send the following: 'Carrageen is an alga, and is termed Irish moss. I used to get presents of it from Miss Stewart of Ensay, and through an old friend and retainer from Islay. It deserves all the praise your writer gives it, especially as a preventive against consumption. When I was in Newfoundland, cariboo hunting, the Indians used to bring us, as a vegetable, a lichen which I think was identical with Iceland moss, and which, with the ever-present cranberry, made a toothsome addition for our cariboo-steak or roast *ryper*. The former was rendered all the more succulent by being fried in marrow, just as our forefathers cooked in prehistoric times, as Johannes Ranke tells us of the Stone Age man, as revealed at Taubach and in the Somme valley. These ancients seem to have used the lower jaw of the bear and its strong canine teeth to break the marrow-bones. Our Indians used to toss the deer's bones on the wood embers, and when cooked lay the bone open by a neat blow of a steel hatchet. There is only one dish to compare with this marrow-cooked delicacy, and that is a beaver's tail, its white fat grilling gloriously in the camp saucepan. When we were travelling in the Andes, in Chili, our invariable food was the roasted grain of wheat ground, husk and all, into a flour or meal. The Chilian guaso carries a supply of this in a calf-skin *bolsa* or purse at his saddle-bow, mixing it with water (cold or hot) or goat's milk, according to his lodging, as often as not on the 'cauld, cauld ground.' We found it most sustaining and far preferable to the alternative of strips of pounded bullock (!), whose meat, spread out on a threshing-floor, was stamped upon by horny-heeled Chilenos, and the result—not free from a mixture of hair and dirt—cut into strips and sun-dried. You might make it tender if you rode upon it, placing your share between the voluminous rugs which drape the high-pointed guaso saddle to form your bed when night closed in.'

LOVE AND DUTY.

O Love! if I seem heedless to thy call,
Think'st thou I do not hear? Can I not see
How narrow is the space that parts from me
The flower-strewn pathway where thy footsteps fall!
My way lies through the thorns. However small
The space between, I may not pass to thee;
So near and yet so far our ways must be—
Ay, side by side—until the end of all!

But God gives comfort, and I know mine eyes—
When I shall come unto life's verge—will cast
One look abroad into sweet Paradise,
And see the ways He parted in the past
(He knoweth why, for only God is wise)—
Duty and Love—converge and meet at last!

SIXTH SERIES.

THE GOLD OF THE 'GUNSIGHT.'

PART I.

'YOU can say what you like, but it's the biggest thing this side the Rocky Mountains.'

The speaker, Joe Langton, a tall, loose-jointed fellow of about twenty-five, was leaning up against the veranda-post. He was one of those big, virile fellows so common in the Western States, over six feet, broad-shouldered, and straight as an Indian.

'Oh, of course, the last prospect is always the richest,' replied his companion. 'Got any specimens with you?'

'Here's one as'll make you stare. Nothing in the "Poorman" to beat it.' Langton took a piece of rock from his pocket and handed it to the other.

'What do you think of this, Rodda?' the latter asked of a young man who was smoking a cigar at the other end of the veranda.

Rodda took the specimen, looked at it a moment, and then shot a quick glance at his friend. 'Oh, pretty fair. Where's it from?' he asked carelessly.

'Pretty fair!' cried Langton indignantly. 'Young man, if you don't know one better than that you had better go back where you came from; you'll do no good out here in the mines. Pretty fair! That piece of rock'll go fifteen hundred dollars a ton in gold, and I've got the assay here to prove it;' and he drew a printed slip of paper from his pocket.

The two men looked over the paper, and exchanged glances again.

'Oh yes, but assays don't prove everything. It might be a picked specimen from a pocket.'

'Great Scot! hain't I bin a-telling you there's a whole mountain of it?' interrupted Langton. 'Why, man, the vein is exposed on the surface over a hundred feet wide of solid ore, and I can trace it a mile long.'

'A hundred feet wide and a mile long! What are you giving us?' replied the young man, laughing.

'I tell you it's so,' stormed Langton. 'Why, hain't I been a-working it off and on for the last four years, just whenever I could dodge the Indians? It's on Indian reservation, but I have done my assessment-work all straight. Maybe that don't count; but I thought if any one got in before me it would give me a fighting-chance, anyhow. But there ain't any one liable to cut me out. There's only one other man in the world knows where it is; and he'd be a mean skunk to try to get the best of me, after I found him in the mountains with a broken leg, and packed him into camp, and then got the best doctor in the country for him. He was a fair-spoken young chap from the East.'

Rodda, who had been closely examining the specimen, spoke up. 'What was his name?'

'Palmer,' replied Langton.

'And the mine is about forty miles up Kettle River, on a creek coming in from the west, which cuts through the ledge, leaving a wall of rock exposed that shows rich ore from top to bottom, doesn't it?' asked Rodda.

A dark flush passed over Langton's face while the other was speaking, and an ugly look came into his keen blue eyes as he reached for his hip-pocket.

'Young man, you know a little too much. I hain't been a-holding that claim and planning on it for the last four years to step aside now and let another fellow reap all the profit.' And with a quick movement a Colt's revolver was shoved in Rodda's face.

The young man grew pale, but his eyes did not falter as he looked into the flashing ones before him. Lightly touching Langton's hand which grasped the weapon, 'Put up your gun,' he said, dropping into the Western vernacular. He spoke calmly, but with a resolution that the other man obeyed. 'I'm not the man you want; I've nothing to do with Palmer, and I am after other game. It just happens that I know of the property, and I know, too, that arrangements are being made to rush it on private information.'

'The devil!' was Langton's exclamation.

'How is this, Rodda?' interrupted Anderson, who was wild at the speech of his friend, but now came forward.

'Never mind how,' replied Rodda; 'the question is, can we do anything about it?'

[*All Rights Reserved.*]

'If it's worth it,' replied Anderson.

'I'll risk it,' said Rodda. 'If Langton wants to go in with me on it we can help him out, and make a good thing for ourselves too.'

Langton, who had been as if stunned on hearing that his plans were known, started up, aroused by the mention of his name.

'Where is the hound? I'll have his life!' And he commenced a volley of curses, when he was silenced by the calm, firm voice of Rodda.

'Come now, Langton, stop that swearing, and we'll make you a fair proposition. If it suits you to go in with us, all right; if not, all right too. Suit yourself. As I said, we are here after other property, and we are buying, not jumping, claims. Our arrangements are all made, our men are ready, and we are waiting, as others are, until the reservation is opened and the ground can be legally filed on. We have made arrangements in the East, so that a private despatch will be sent us directly the Bill is passed, and no one can know any sooner than we shall. So, under the circumstances, you couldn't find much better partners. For the rest, I happen to know that this fellow had made arrangements to rush in on the ground ahead of you. I did not know he was cutting any one out, but suspected it; and when you showed me that specimen I knew it must come from the same mine. Now, this is the question: Do you want to go in with us? We'll give you our information directly it comes, and you can have relays of horses ready on the road, so you will have as good a chance as Palmer to get there. Which is it—yes or no?'

Langton looked from Rodda to Anderson as though trying to read their thoughts. 'It's no game you're putting up on me?' he asked slowly. Then, not waiting an answer, 'No; it's the truth. If I can tell an honest man, you are one. And if you help me to save that mine, by gum! I'll give you the hull thing rather than let that miserable skunk have it. I'm broke, though. Will you put up the money for the horses? I didn't expect a run for it, and I've only got my little black mare; she's one of the best in the country, but couldn't do forty miles through snow against fresh relays.'

'That's all right. We'll stand all the expense if you just attend to getting there and putting up the notices. Get the best horses you can find, and start them off to the point where you'll want them. But, remember, keep your head clear, and no shooting if Palmer should appear on the scene. Now, see about the horses, and start them off, for the news that the land is thrown open may arrive any minute.'

'One thing,' said Langton as he turned to go: 'what terms would suit you? Would thirds be about right?'

'Perfectly! That's fair,' said Rodda.

Langton's face cleared. 'Well, if what you tell me is true—and I know it is—you've acted like white men, and you might have gone in for yourselves; but I'll get those claims, and it shall be share and share alike. There are three, and it's a bigger thing than you dream of, young man. Why, the Injuns used to take the native silver out of the rock to make sights for their guns; that's how it comes by the name. And Joe Langton is the man who'll never forget what he owes you. I'll go and see about the cattle now, and send 'em on. I know where I can get two of the best racers in the country off a couple of half-breeds, and I'll have 'em stand, ready to throw the saddle on, day and night. They'll be there, for they know Langton, and what they'll get if they fool with him.' And the man strode along.

'Well, Rodda, I hope you know what you're about,' said Anderson, 'for I'm sure I don't.'

'I know I'm going to make a fortune for each of us, if I'm not greatly mistaken,' answered Rodda, allowing some of his excitement to show at last. 'I've not studied mineralogy all these years not to know ore when I see it; and if half what Langton and Palmer say is true there are millions in it.'

'But how did you know about Palmer?' exclaimed Anderson, his companion's enthusiasm beginning to fire him.

'Why, that drunken fellow the landlord put him into my room a couple of days ago because the house was so full. He's been playing off sick, and kept to the room. I see now it's because he's afraid of Langton seeing him and suspecting what is up. He's been half-full all the time, and last night was wholly so, and persisted in showing me specimens and telling me where the mine was. I suspected he was going to cut some one out, but it was none of my business; but when Langton showed me his specimen I saw it was the same, and when he spoke of one other knowing, and how he came to know, I saw through the whole thing. Naturally, I depended a good deal on you when I told Langton to go ahead and I'd put up the money; but if you think it's too risky just say so, and I'll go in alone.'

'No, no. I'll put up my share; that's all right,' said Anderson, quite mollified in spite of the secondary part he was obliged to play.

Anderson, a New York capitalist, had come out there to 'get in on the ground floor,' as he expressed it, in buying up some of the rich quartz claims that had been known of for a long time on the Indian reservation, which was about to be thrown open for settlement. Several very rich mines which he owned in the Cariboo country in British Columbia were known to extend across the boundary into the Indian lands, and it was for the purpose of securing some of these that he had come on, bringing Will Rodda, a young mining expert, out with him.

Arrangements had been made by which he would have the earliest possible information of the opening of the land. It was publicly known that the Bill had passed Congress and gone to the President for his signature, and the little town of Hailey was crowded with miners waiting the news that it was signed to rush across the river, on the other side of which the reservation lay.

The great rush, of course, would be to where veins were known to exist, for, as there were several feet of snow on the ground, the chances of any new finds were small; but, with the madness of men where gold is concerned, hundreds were waiting to rush in, where possibly not more than half-a-dozen could get anything to repay the expense and risk until the spring opened.

The town of Hailey, one of the nearest points to the goldfields, which had a cable ferry, was crowded to its utmost limit of shelter, and far up and down the river-bank stretched the tents of those waiting the word to rush for the land of promise, for none dared to cross the river until that word should come, and run the risk of being 'too-sooners,' and so forfeit all rights of location.

The horses for relays had been despatched to the appointed posts with their half-breed owners, and Langton and his friends were anxiously awaiting the message, now hourly expected.

The dull gray of a winter morning was lighting the sky, from which the stars had paled, excepting one which throbbed and flashed with wondrous brilliancy in the keen mountain air. The little town lay silent, huddled in irregular shadowy groups between the river and the hills. Suddenly two men appeared, making their way rapidly down the bank to the ferryman's cabin. They reached the hut, and tapped softly at the door. As they did so a man came down the narrow path to the river, leading a horse which danced and curveted in the chill morning breeze. It was Langton.

Anderson, who had feed the telegraph-operator to stay in his office and receive the message which he felt certain would be sent, had been rewarded by having it delivered to him about ten minutes before. 'Get up, Langton,' he said sharply; and the latter, fully dressed, tumbled out of his blankets. As they left the room and passed Rodda's door, Anderson gave a sharp cough, and by the time they gained the street the other had joined them. While Langton went to get his horse they had hurried on to arouse the ferryman.

Langton walked his mare on to the boat, and stood rubbing down her legs and talking soothingly to her as the spirited creature stepped nervously around. Rodda joined him.

'Do you think you can do it?' asked Rodda. 'The mare looks light for your weight.'

'I'm riding light,' said Langton; and Rodda noticed that he only wore a buckskin shirt belted tightly round his waist and a pair of overalls tucked into leggings of the same.

'Why, man, you'll freeze!' he exclaimed, as he pulled up the collar of a heavy beaver overcoat.

'Tis pretty sharp,' said Joe, swinging his arms about him to get up a circulation. 'But every pound counts at a time like this. If I clear this first reach I'll get something of Indian Joe when I go on; but if it's a run, why, I reckon I'll have to ride fast enough to keep warm,' he answered grimly. 'The mare's good enough for this stage if the road isn't too soft. This first twenty is a level stretch, and she'll come out ahead if I get across the river before any one else. That's all the start I need. But where is that infernal ferryman? The town will be out in five minutes; I see lights flashing now.'

Rodda turned with a start, and Anderson appeared with the reluctant ferryman. A moment more and they swung out into the current.

Hardly had they done so when a shout from the bank made them look back. A group of men and horses showed darkly in the dim light. Frantic gesticulations and imprecations called them to halt.

'Can't. We've struck the current. Have to wait till I git across,' shouted the ferryman.

The noise redoubled, and almost instantly every tent along the bank flashed into rosy light as the inmates, awakened by the hubbub and surmising the cause, sprang up and began their preparations for the 'rush.'

'Ha, ha!' laughed Langton, 'we're on the flood this time, and it leads on to fortune, and don't you forget it.'

They were out on the river now, with nothing of the shore visible save the lights darting about the little town and the mountain looming darkly in the background. The black river tumbled under the front of the boat, and the pulleys slipped complainingly along the frosty cable.

Langton, alternately soothing and scolding his nervous mare, seemed the least anxious of the three. To Rodda there was something eerie in the scene—the dark-flowing river, the big black mountain, and the lone star flashing brightly in the gray sky.

'When will we look for you?' he asked at length, to break the silence.

'Twelve hours is as quick as man and horse can do it,' answered Langton. 'And mind you have a horse ready, so that when I come in with the notices you can get them to the county seat and filed with the Recorder as quick as horseflesh can do it. Then we'll be safe.'

They were nearing the western bank, and Joe sprang to his saddle. The boat hardly touched the sand when with a spring the mare was off.

'Good-luck!' called Rodda and Anderson.

'So long!' cried Langton, as the ferry moved back into the current.

'Hope he'll make it,' said Rodda. 'Hope so,' replied Anderson. That was all that was said, though each man knew that on his 'making it' a fortune for each depended.

Anderson was in a tremor of nervous suspense, although, with his wealth, it could not mean to him what it did to Rodda, young, just starting in life, and no pampered child of fortune.

Joe Langton had planned on three stages—twenty miles of level ground for the black mare, and ten of stiff mountain grade for each of the two relays.

The twenty miles was all but done, and the mare was taking it easy up a gentle rise. She was covered with foam, and her flanks quivered; but the slender ears still pricked up nervously in response to her

master's voice: 'You've done it, lady; and if you don't have a silver bit and bridle-chain for this piece of work my name's not Joe Langton. What is it?' as the mare gave a nervous start forward. 'Somebody behind you?'

He turned, and almost at his mare's flank was the nose of a powerful bay, whose rider was leaning forward and with whip and spur urging it on.

A glance showed it to be Palmer, and a savage light came into Langton's eyes as his hand sought the butt of his revolver. But he drew it away. 'No, we'll have no shooting,' he said to himself. 'We'll make it without, if there is such a thing as right; and somehow I feel there is, and that the odds are with me.'

The mare had let herself out at a word from Joe; and they fairly flew down the hill, the white cakes of snow from her feet dashing into the face of the rider on the big bay, who clung close to the rear, but could get no nearer.

It was hardly a quarter of a mile farther, and though the pace was tremendous the mare could stand it. 'If that limb of a half-breed don't have that horse ready I'll shoot him dead,' muttered Joe.

They rounded a curve of the valley where the horse should be waiting; and there he was, saddled and ready. Joe could have shouted for joy.

But what was that?—a second horse, saddled, and tied to a tree by the roadside! 'A relay for Palmer, by all the devils!' he gasped.—'Joe, you dog, what's that?' he cried as he sprang from the mare and on to the waiting horse, jerking the bridle from the half-breed's hands.

''Noder fellow want horse too for relay.'

'I'll relay you when I get through this, you black rascal!' thundered Langton as he galloped away.

'You get my racer! Nobody but Langton get my racer!' shrieked the half-breed after him in extenuation as he ran to untie the extra horse.

'I'll take it out of your racer, you son of a coyote! if I break every limb the critter's got,' muttered Langton savagely as he drove in the spurs. The animal sprang forward; but Langton heard a shout behind him that made him turn in his saddle. As he did so a bullet pinged past his head and buried itself in the trunk of a tree.

'That's your game, is it?' and his hand went to his revolver; but, instead of drawing, he suddenly plunged himself forward, and over the saddle, and along the side of his horse, one hand grasping its mane, Indian fashion, leaving one arm and leg exposed. No one but an expert rider would have attempted the trick.

'You black-hearted ruffian,' he muttered as another bullet sang by, 'twould be a good deed to shoot you; but I'll beat you yet, you treacherous hound! Saved your worthless life, did I? And you talked so nice, and now you fancy that I'm agoing to let you beat me out of the richest mine west of the Rockies? I guess I'll sit up and see if you can hit me, and then won't I make it hot for you!' Suiting the action to the word, he straightened himself up in the saddle and looked back; but Palmer was too far in the rear for a revolver to carry, as the thoroughbred in his flight had been going like the wind. Lifting his broad felt hat, Langton swung it about his head, and, with an ironical cheer to his defeated enemy, dashed out of sight into the pines.

IN NINETY-EIGHT.

By Henry W. Lucy.

WHO dares to talk of ninety-eight? It is an old number of the *Times* newspaper, bearing date 'Wednesday, October 3, 1798,' which has by good luck floated down the tide of time these hundred years. It is a poor, frail little thing, yellow with age, crumpled and creased, a pigmy by the side of its sturdy great-grandchild of to-day. Nevertheless, it is priced at the same rate—threepence. The news it contains justifies a far higher price, for, in addition to despatches from the battlefield in Ireland, where open rebellion was being grappled with, it contains the text of Nelson's simple announcement of the glorious victory of the Nile. It is actually a single sheet, which, folded in two, measures twenty inches by fifteen. It bears the imprint: 'London: Printed at the Printing-Office in Printing-House Square, Blackfriars, by C. Bell (Brunswick Street), and published by J. Bonsor (Salisbury Square).' There is no reference to the mighty personality already at work upon the *Times*.

The first John Walter was at this epoch at liberty, having been released some eight years earlier from a term of imprisonment that lasted sixteen months, with a supplementary fine of fifty pounds and a position in the pillory for one hour. This was for a libel on the Duke of York. Probably, in view of fresh contingencies, Mr Walter thought on the whole it was better to keep his name in the background. However it be, it does not appear on this particular sheet.

Of the sixteen columns that constitute the issue, nearly seven are devoted to advertisements—a fair proportion of necessary backbone. From these we get side-glances at social life in England a hundred years ago which are not without interest. Theatres do not largely advertise, though that one at least was open appears from the news column, where Mr Kemble is announced as playing the part of Zanga in *The Revenge*. 'This Gentleman's delineation of the character,' writes the Tom Taylor of the day, 'is in many respects as finished a piece as our stage affords. The subtle and malignant spirit of

vengeance was finely marked from the beginning by a judicious and imposing semblance of friendship and candour. In the descriptive scenes he was clear and impressive, and in the imitation of the leading passion natural and vigorous. The declaration of the motives which influenced him to the work of destruction was accompanied with a dignity of emotion which almost justified the excessive resentment of the Moor.' Mr Dignum, Mr Kelly, Mr Sedgewick, Miss Leak, and Mrs Bland are named among the *dramatis personæ* on this evening of the 2nd of October 1798.

Besides the regular drama, attractions were offered at the Royal Circus, where 'an entirely new comical harlequinade, called *Mirth's Medley*, or *Harlequin at Home*,' was forthwith to be produced. There was also a panorama in Leicester Square, having paid the admission fee to which, 'Observers may suppose themselves in the Highest Turret of Windsor Castle, and can see at one view a part of 14 counties. St Paul's and Shooter's Hill are plainly discernible, with distant Lands beyond Sydenham Hills, halfway to Portsmouth.' It is cautiously added that 'part of Wiltshire is likely to be seen;' but this is not positively promised. 'The whole, interspersed with Towns and Noblemen and Gentlemen's Seats, forms a delightful scene, rich beyond description.' Last, but not least, there was Ranelagh, which announced a 'Grand Gala, in honour of Lord Nelson's glorious victory over the French Fleet at the Mouth of the Nile.'

Among the business announcements is put forth a notable scheme of what is called progressive annuities. Not less than thirty thousand pounds are wanted. Each subscriber of one hundred pounds was to be granted for life an annuity according to age. From forty-five to fifty the annuity was eight guineas, from sixty-five to seventy fourteen pounds, increasing five shillings every year for the first twenty years of subscription.

On the Wednesday following the day of publication, the anniversary of Mr Charles James Fox's first election for Westminster was to be held at the Shakespeare Tavern, Covent Garden, oddly enough with 'Mr Fox' in the chair. They dined early in those days (at four o'clock), and cheaply, tickets being only eight shillings. Another thing cheap at this epoch were 'handsome bay mares.' Here is one, 'five years old, 14½ hands high, warranted sound, and parted with for no fault whatever; the only reason the Gentleman is gone abroad, and left her in the hands of a friend to dispose of, at the moderate price of 10 Guineas.' Not less cheap—if the season was of moderate length and Mr Kemble acted every night—are 'two or three tickets for free admission to Drury Lane Theatre for the whole duration of the present season, price 6 Guineas each.'

We get a view of Old London in the advertisement of 'a house to let, situated in the central part of Oxford Street, immediately opposite Great Portland Place, commanding a view of the country between Hampstead and Highgate, remarkably airy and pleasant.' These are not attributes of Oxford Street at the present day, when the view from the central part is limited to houses over the way and the densely populated streets lying behind them up to Hampstead and Highgate.

Farther afield the king's highway was by no means safe. Under date July 1798 the Postmaster-General, in an advertisement which had apparently unavailingly dangled a reward of two hundred pounds before the public eye for three months, wants 'a young man, middle size, had on a drab-coloured gray coat, and rode a horse with a white face.' It appears that the postboy carrying the mail from Bromley to Sevenoaks was stopped about two miles from Farnborough, between the hours of ten and eleven o'clock, by a single highwayman, who presented a horse-pistol and demanded the mail, which the boy gave him. 'The boy offered the robber half-a-guinea,' but whether in lieu of the mail or in supplement does not appear. At any rate, 'the robber declined taking it.' A reference in the text of the advertisement shows that there was a standing offer embodied in an Act of Parliament of forty pounds for apprehending a highwayman. The Postmaster-General's two hundred pounds is in supplement to this statutory reward. In addition to particulars given above, the highwayman 'had a pair of small saddle-bags, and the appearance of a London Rider, in the opinion of the turnpikeman.' However that may be, he seems to have been free three months after committing the felony, and the Postmaster-General was throwing good money after bad by persistently advertising for him in the *Times*.

There is in another advertisement hint of a quarrel about the proprietorship of the *Annual Register*. The volume for 1793 is somewhat tardily announced as 'this day published, price 8s. in boards, 8s. 6d. half-bd.' The work was originally the property of Mr James Dodsley, and on the 20th November 1797 was disposed of at his sale, and purchased by Messrs Otridge & Son. Messrs Rivington laid claim to having 'the principal author and editor of the said *Annual Register* engaged with them.' But Messrs Otridge & Son flaunt in their face the assignment of the work to them, and triumphantly ask: 'What will the purchasers of Dodsley's *Annual Register* now conceive of Messrs Rivington's refutation?'

Of births, deaths, and marriages there is an aggregate of four announcements. One is set forth in truly quaint form: 'On the 24th of last month, much regretted, at his house at Hackney Terrace, after a short illness, Mr John Braidwood, many years an eminent instructor of the Deaf and Dumb, and son-in-law of the gentleman of the same name who first brought this useful art to perfection in Great Britain. The public will be happy to find (see Advertisement in front of this Paper) that an institution so beneficial to an unfortunate part of mankind is to be continued by his Family.' It would be interesting to know whether this way of

putting it was precedent to the rhymed version of the same happy mixture of sentiment and business:

> Resigned unto the Heavenly will,
> His wife keeps on the business still.

There are only four advertisements of servants wanting places. One, 'a widow of between forty and fifty years of age,' who wants a place as upper servant, and mentions enticingly in recommendation that she 'was eleven years in her last place, *where her lady died*.' There are a considerable proportion of quack medicines advertised. Here are Spilsbury's Anti-Scorbutic Drops, agent for many wonderful cures, including 'the remarkable case of Mary Esdale, who went on crutches, and was discharged from St Bartholomew's Hospital as incurable, was restored to health by these drops, and walked without even the assistance of a stick.' To the verity of this 'Mr Croft, taylor [spelt with a 'y,' Sammy], of No. 65 Fleet Street, London,' was prepared to testify.

What with despatches from the mouth of the Nile and news from the headquarters of the forces in Ireland, there is not much room for miscellaneous items. But we read that 'Mr Curran, the Irish barrister, is arrived in town; he resides at Lord Moira's.' Mr Pitt, it seems, 'is not confined with the gout at Walmer. We saw him yesterday in the Park, in perfect good health.' As for Mr Fox, we learn that 'the Opposition papers state he does not mean to attend to his duty in Parliament during the ensuing Session.' But we can get along without Mr Fox. 'However greatly the talents of this gentleman may be rated, the want of his counsel has not proved detrimental to the public prosperity. It would, on the contrary, appear, from the brilliant successes of the country since his secession, that his absence has been auspicious to the promotion of our national honour and glory.' There is talk of making a tunnel under the river Thames from the parish of Gravesend to the parish of Tilbury. Application will shortly be made to Parliament for leave to maintain it by toll. Freedom has not yet shrieked for Kosciusko's fall. He appears in these far-off October days to be 'residing in Paris, whence he has published a letter intimating that all the Polish refugees are to have an asylum in Italy.'

That incident of the appropriated postbag, mentioned on the previous page, is not an isolated example of the state of the roads. 'On Monday evening last, between six and seven o'clock, as Mr Vernon of the Treasury and another gentleman were returning to town in a postchaise, they were stopped near Merton Turnpike by two footpads, who robbed them of their watches, money, and a trunk containing wearing apparel, &c.' The same evening Lieutenant Millar, of the Royal Horse Guards, was stopped in a postchaise near Stevenage by two highwaymen, who robbed him of a gold watch and some money. This Monday evening was a busy day with the fraternity, for in another column it is reported that 'at six o'clock Mr Courvoisier, one of his Majesty's Messengers, was stopped by two highwaymen, who robbed him of near £3 in cash.' That the highwaymen did not always have it their own way appears from the current report of Bow Street Police Office, where 'Brown, Russell, and Shirley were yesterday finally examined and fully committed to take their trial for assaulting and robbing Mary Ginnery on the highway in St Giles's.' Highway robbery was a hanging matter in those days; and Russell and Shirley at least were in a bad way, being detained for trial on a further charge of robbing the house of Mr Rose in Charlotte Street, Bedford Square, of a quantity of wearing apparel.

The pressgang was in full working order, His Majesty's fleet, busy at the Nile, off Brest, and elsewhere, requiring constant recruits. John Hanning, a seaman, surrounded by the pressgang at Newhaven, turned upon them and slew one. 'The keeper of the Lewes House of Correction entering his cell, with intent to remove the prisoner to Horsham Jail by the warrant of the coroner, found him hanging by the neck,' a circumstance which provided unexpected work for the coroner. The jury bringing in a verdict of *felo de se*, the unfortunate seaman was in the dead of the night buried in the cross-roads near St John's Church; 'but,' it is added, 'the stake commonly used on such occasions was dispensed with.'

The militia are embodied, and some regiments are on active service in Ireland. The Cambridge Militia, which, under the command of Lord Hardwick, have been all the summer encamped on the cliff at Harwich, on the lookout for Boney or some of his captains, 'this morning struck their tents and marched to Colchester Barracks.' The Derbyshire Militia, encamped on Clapham Common, will also presently be on the move, having received orders to strike their tents and march for Lewes Barracks. Lord Kenyon is presiding in the Court of Common Pleas, and has pleading before him, in a case occupying the attention of the Court, one Mr Erskine. 'Among the wonders of the present day,' we read, 'Mrs Siddons's late achievements at Brighton, Bath, and London should not be forgotten. She positively performed at each of these places within the incredibly short space of ninety-six hours!!!' The coruscation of notes of admiration are of contemporary date.

There is one resemblance between the *Times* of 1798 and the *Times* of 1908, inasmuch as with both Ireland occupied a large share of the space devoted to news or editorial comment. This was the year famous in Irish history when Lord Edward Fitzgerald was still alive, and Napper Tandy was hovering around the coast in command of French troops that never landed. There had, however, at the date of our paper, been a descent of the French, who on the 22nd of August landed at Killala a force nine hundred strong, and, reinforced by the Irish rebels, had routed the Royalist army at Castlebar. Our issue of the *Times* contains despatches from General Trench, in command of the Royalist troops, dated 'Camp, near Killala, 24th and 25th September.' By this time the Royalist troops had rallied,

beaten and captured the French invaders, and General Trench was occupied in disposing of the dauntless peasantry who still remained under arms. The rebels had taken refuge in Killala, which General Trench stormed, rescuing the Bishop and his family, beleaguered in their palace. In the despatch here published General Trench gives a graphic description of 'the Bishop, his family, and servants, armed with carbines, barricaded in their room, preparing to resist the threatened violence of the rebels.' The *Times* 'has pleasure to add that by the success of General Trench's operations a decisive blow has been given to every root and fibre of rebellion in Ireland.'

But the news from Ireland, satisfactory as it was, was eclipsed by the greater glory of the despatch that had just reached the Government from the mystic Nile. Mrs Siddons, as already noted, amazed the public by visiting Brighton, Bath, and London within the incredibly short space of ninety-six hours. This feat was eclipsed by Captain Capel, son of Lord Essex, who had brought to London the news of the battle of the Nile. The engagement began at sunset on the 1st of August. On the 3rd of August, Nelson —he was only Sir Horatio then—sat down to write the despatch reporting the affair. This he addressed to Admiral of the Fleet the Earl of St Vincent, then understood to be somewhere 'off Cadiz.' Four days later, on August 7th, it occurred to Nelson that perhaps the people at home in England might like to hear of the little affair. Accordingly, he determined to send Captain Capel overland with a copy of the despatch. He was evidently not sure that he was not herein overstepping his duty, for in addressing the enclosure to the Secretary to the Admiralty he writes: 'In an event of this importance I have thought it right to send Captain Capel with a copy of my letter overland, which I hope their lordships will approve.' Having the precious document in his charge, Captain Capel set forth, and travelling, it may be presumed, with the utmost speed then available, reached London in the incredibly short space of fifty-six days! In justice to Captain Capel it ought to be added—upon the authority of an official statement—that 'he was detained at Naples one day, owing to some necessary ceremonies of quarantine.' Otherwise the news would have reached London in fifty-five days.

The despatch in which Nelson made known the accomplishment of this decisive victory is a marvel of modest conciseness. The little sheet prints it in the dignity of its largest type, and it is a pleasant task to disinter it at this time of day. Here is the text:

'My Lord,—Almighty God has blessed His Majesty's arms in the late battle, by a great victory over the Fleet of the Enemy, whom I attacked at sun-set on the 1st of August, off the mouth of the Nile. The Enemy were moored in a strong line of battle for defending the entrance of the Bay (of Shoals), flanked by numerous gunboats, four frigates, and a battery of guns and mortars on an Island in their Van; but nothing could withstand the Squadron your Lordship did me the honour to place under my command. Their high state of discipline is well known to you, and with the judgment of the Captains, together with their valour, and that of the Officers and Men of every description, it was absolutely irresistible.

'Could anything from my pen add to the character of the Captains I would write it with pleasure, but that is impossible.

'I have to regret the loss of Captain Westcott, of the *Majestic*, who was killed early in the action; but the ship was continued to be so well fought by her First Lieutenant, Mr Cuthbert, that I have given him an order to command her till your Lordship's pleasure is known.

'The ships of the Enemy, all but their two rear ships, are nearly dismasted; and those two, with two frigates, I am sorry to say made their escape; nor was it, I assure you, in my power to prevent them. Captain Hood most handsomely endeavoured to do it, but I had no ship in a condition to support the *Zealous*, and I was obliged to call her in.

'The support and assistance I have received from Captain Berry cannot be sufficiently expressed. I was wounded in the head, and obliged to be carried off the deck, but the service suffered no loss by that event. Captain Berry was fully equal to the important service then going on, and to him I must beg leave to refer you for every information relative to this victory. He will present you with the flag of the second in command, that of the Commander-in-Chief being burnt in the *L'Orient*.

'Herewith I transmit you lists of the killed and wounded, and the lines of battle of ourselves and the French. Horatio Nelson.

'To Admiral the Earl of St Vincent,
Commander-in-Chief,
&c., &c., off Cadiz.'

In the covering letter to the Secretary to the Admiralty Nelson says: 'I have the pleasure to inform you that eight of our ships have already topgallant-yards across ready for any service.'

After the Nile was to come Trafalgar, and the end.

It is almost impossible for us in these days of telegraphs and war-correspondents to realise a state of things in which one of the greatest battles in the world's history could have been fought almost within sight of Europe, and that nearly two months should elapse before the news reached London. When it did come there were no bounds to the public delight. The first news was conveyed to the crowd in the streets by the booming of the guns from the Tower and the pealing of bells from a score of churches. At night the city burst forth in a blaze of illumination. Before the Admiralty a vast crowd gathered, and 'the mob as usual,' we are told, 'insisted upon every person of genteel appearance pulling off their hats. Six officers passing along were ordered to pay the same compliment to the mobility, and refusing

to do so, the populace endeavoured to force their hats off. The officers drew their swords, and some persons were wounded.' At the theatre, where, as we have seen, Mr Kemble had been playing Zanga in *The Revenge*, nothing would do but that the company on the stage should sing 'Rule Britannia.' This they did, the audience joining in the chorus. Then they shouted for more, 'and the acclamations were the loudest and most fervent we have ever witnessed.'

The King—George the Third, of sacred memory—was staying at Weymouth, whither a message was sent off express in order that His Majesty might learn the glad tidings before he went to rest. The messenger, it is reasonable to suppose, found His Majesty sated with the excitement of celebrations which had taken place a day or two earlier. 'The anniversary of the birth of their Majesties' eldest daughter, the Duchess of Wurtembergh, had just hapt, and the King, the Queen, and all the Princesses, with a number of the Nobility, went to Maiden Castle, near Dorchester, to see the sports of the Country-people, which were not over till late in the afternoon.' These sports were as manly as they were varied. There was a cheese to be rolled down the hill, with a prize to whoever stopped it. A pound of tobacco to be grinned for. There was a Michaelmas-day goose to be dived for; a good hat to be cudgelled for; a handsome hat for the boy most expert in catching a roll dipped in treacle and suspended by a string. There was a leg of mutton and a gallon of porter to the winner of a race of one hundred yards in sacks. There was a good hat to be wrestled for; and, appropriately at the end, a prize to whoever caught a harried pig by the tail.

How 'the King, the Queen, and all the Princesses, with a number of the Nobility,' must have laughed to see such fun! After this probably the news of Nelson's victory at the Nile fell a little flat on royal ears. There is unfortunately no record of the manner in which the King received the news, the record leaving Mr Winchester starting off express for Weymouth.

In another part of the paper there is a single line which will bring the state of the country sharply before the mind's eye. Under the head 'Price of Stocks' we find it written, 'Three per Cent. Consols, 50 ¾ ⅞ ¾.' In the direst days of the depression that marked the close of last year they did not fall below 82, albeit the interest is reduced to 2½ per cent.

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire*, *How England Saved Europe*, &c.

CHAPTER XXI.—IN THE TEMPLE.

'JEAN,' said Toulan abruptly to him as they met one evening outside the Hôtel de Ville, 'we want an attendant in the Temple, and I shall take you. You have one great qualification—you can hold your tongue.'

Jean was breathless with astonishment at such a proposal. Here was a chance beyond all he had ventured to hope of seeing what lay in the stony heart of that dark tower round which, since the death of the king, such shadows gathered and in which sat a discrowned queen and her children waiting for some unknown fate. It puzzled him to guess why such an offer should be made. It might, indeed, be a trap; but it lay too clearly in the line of his own plans for him to hesitate. If there was risk he must take it.

Nine o'clock that night found Toulan and Jean waiting at the gate of the Temple. A little cluster of officials had gathered, and each was closely scrutinised as he entered. Jean was provided with a card of entry, though Toulan explained, in peremptory accents, that it was not really necessary, as he was to be used in the household work of the Temple, and he (Toulan) answered for him. The gloomy-looking officer at the gate, however, examined both Jean and his card with vigilant care.

The municipal officers—one of them was Lepitre—entered a large room on the first floor of the Temple, in which a table was spread with food. They seated themselves, and, with many rough jests, ate a hearty supper. Then a lamp was thrust into Jean's hands, and the party mounted a winding staircase till they reached the third floor. Outside the heavy door, crossed with bars of iron, stood a sentry; but the noisy group pushed past him into the room with little ceremony, Jean following.

It was an apartment some thirty feet square, occupying the whole area of the main tower, with a door in each corner—one leading from the stairs, the others opening on little rooms in the smaller towers built at each angle of the main tower itself. The floor was of uncarpeted brick, broken in many places, and showed scanty signs of having been swept. The walls were covered with paper of a hideous green tint, that hung down in many places in ragged strips. An Italian bed stood on one side of the room; a couch with high back and sides, that served as a bed, stood near it.

There were two windows on each side of the room; but the walls were not less than nine feet thick, and each window resembled a tiny thread of glass at the end of a tunnel. Under one window was a ragged sofa; over the mantelpiece was suspended a small and dirty mirror. In the centre of the room rose a squat and clumsy pillar, from which spread flat arches to sustain the floor above. Against

the pillar was placed a table; a few chairs were scattered about the room.

Jean looked eagerly at the figure sitting on the couch. Yes, it was the queen, the once proud and beautiful Queen of France, the daughter of a line of kings. Jean had seen her in the great procession at the opening of the States-General, a stately figure sitting in proud silence beside the king and looking with scornful eyes on the shouting crowd. She was Marie Antoinette still, but her hair was snow-white, though she was only thirty-seven. The oval face had grown smaller; the little mouth was drawn and pinched; the once red, proud lips were colourless, though still the under lip had the familiar Hapsburg droop—the sign of her race. Her eyes were dazed, almost as if she were drugged; fear and sorrow had quenched the haughty fire beneath those beautiful brows.

Sometimes her eyes ran to and fro like those of a frightened animal; then again they grew steady, and the pupils narrowed to a pin-point as they answered the brutal stare of the officers of the Commune. It was a haggard face, stamped with all the hieroglyphics of suffering; but still the slender neck carried the proud head as erectly as ever.

The fallen queen's arms were clasped round her boy. He was a child not quite eight years old, thin, dull-faced, and stunted; his head hardly reaching up to the side of the couch by which he stood. His whole aspect was curiously stupid. But this was the heir of all the Capets! The blood of a hundred kings ran in that poor boy's veins. Since his father's death he was Louis XVII., and that fact drew deadly perils about his unconscious head. What mother's child ever knew such strange contrasts of fate as did this thin and dwarfish figure round whom Marie Antoinette's arms closed so passionately?

A girl of fifteen—Madame Royale, as she was called, the queen's eldest living daughter—stood beside her mother. Behind her was a gentle-faced woman of thirty—the Princess Elizabeth.

The members of the Commune who were on duty that night as guardians of the royal family took their task in a spirit half-jesting and half-brutal. They represented the wilder spirits thrown up by the storm of the Revolution, and they bore themselves in the queen's room with the air of conquerors.

One of them—Morel, an elderly man, with the face of a fanatic, and dress so elaborately rough and dirty that it must have been designed to advertise his Spartan simplicity of virtue—flung himself roughly down on the sofa beside the queen. An ex-priest, Bernard, with red, inflamed eyelids, unshaven chin, and sensual lips, discharged at the top of his voice lewd jokes at his companions, snapping his pustuled eyelids incessantly during the process. Mercereau, a stone-cutter, with a face as hard as the granite he once dressed, sat down in front of the fire, turning his back on the queen. Toulan, Jean noticed, was almost the loudest and roughest of the group. Lepitre alone showed some sign of respect for the silent queen, though this was done in a furtive and half-terrified fashion.

Presently, in careless fashion, the representatives of the Commune began an examination of the room. They turned the bedclothes roughly down, opened the doors into the smaller rooms, and swaggered to and fro, talking loudly.

Jean watched the scene with astonished eyes. Pity and a furious inarticulate wrath stirred in him; but he suddenly noticed that Toulan was glancing keenly at him, and he instantly discharged his face of all sign of emotion. Pity, if it became too visible, might, he knew, cost him his head. More than once he was uneasily conscious of Toulan's quick eyes watching him intently.

Jean went every day to the Temple in company with Toulan, and was given many tasks of a domestic sort. He carried wood to the queen's chamber, helped in the service of the meals in the guardroom, &c. Each time he went into the queen's room, the little companionless boy-king, the silent, pathetic group of women who always had the air of waiting and listening for some dreadful doom to be announced to them, pricked his heart with an almost intolerable pity.

One afternoon, about a week after being taken into the service of the Temple, Jean was hurrying to Toulan's residence, when, crossing the head of a narrow lane, he passed a man with a keen, bold face that seemed half-familiar. The dark, commanding eyes glanced at him quickly. He felt sure presently that the man had turned and was following him. The steps grew quicker behind him, and at the narrowest and darkest part of the crooked lane Jean felt a hand touch his shoulder. He swung quickly round; a strong and soldierly face was stooping towards him, and Jean recognised it. It was a soldier, General Jarjayes, whom he had seen again and again at his stepmother's receptions. The soldier drew Jean into an angle of the wall.

'Laurente,' he said, 'I know you, and so do others; and we think you can be trusted. You do not belong to this canaille,' with an abrupt jerk of his hand towards the foul buildings all about them. 'You go to the Temple; you see the queen and the dauphin. Your heart is not a stone; you must pity them. Will you render them a service?'

Jean had listened in silence so far; but his wordless nod was expressive, and the look in his eyes more expressive still.

Jarjayes went on, dropping his voice to a whisper, but with great eagerness, 'Give this to the queen;' and he produced a tiny roll of paper. 'It is a message for which she is waiting.'

'I cannot,' said Jean; 'the representatives of the Commune are always in the room.'

'Yes; but you need not put it actually into her hands. On the little table at the head of the stairs stands a water-bottle. Take out the cork and slip this roll of paper in its place. Look at it,' he went on as he unrolled it. 'It is blank. There is writing

on it, but it is in lime-juice and is invisible. There is no risk, and we will pay'——

But at the word 'pay' Jean flung up his chin with a look which arrested speech on the lips of his companion.

'Oh,' he said hurriedly, 'you do not want pay. Your reward will be the gleam of comfort you will carry to the sad heart of the queen.'

The pair talked together a little longer, and Jean at last took the tiny roll of paper. There was risk in what he was asked to do, but the pity for the queen burning in his blood made him willing to undertake the task.

For two or three days he watched for an opportunity to do what he had promised, but in vain. One evening, however, Toulan bade him, abruptly, wait on the landing at the head of the stairs, and left the door that led into the queen's room half-open. The sentinel, as it happened, was absent, for discipline was lax, and Jean stood alone on the landing. It seemed a golden opportunity. He stood opposite the gap left by the half-opened door till the queen happened to look towards him; then with a quick gesture he pointed to the bottle, into which he thrust, as a cork, the roll of paper.

Presently the commissioners came noisily trooping out of the room and clattered downstairs. The rest of the party passed into the guards' room; but Toulan beckoned Jean to follow him, and with a certain disquiet he obeyed. Toulan led the way till they came to the lowest landing-place, where they were alone; then he turned abruptly.

'Laurente,' he whispered fiercely, 'you are an aristocrat. You want to help the Capets. What was that you put into the neck of the bottle? You are a traitor. Madame Guillotine will kiss your soft neck;' and the keen eyes flashed with triumph as they ran over Jean's face and figure.

Jean flushed, then grew pale; but he kept silent.

'It is there still,' said Toulan in exultant tones, 'to accuse you.' Then he dropped his voice. 'Who gave it to you? Tell me. There is gold for you in it—much gold, and safety. But you must tell me. Do not risk your head.' And with insistent voice, now full of menace and now of apparent kindness, Toulan pressed him over and over again to say from whom the message came.

Jean looked even more impassive than ever while the keen-faced Frenchman bent towards him; but at the repeated demand, 'Tell me, who gave it to you?' he shook his head with a look of doggedness. Betray! At the mere thought scorn ran like a flame through his blood. So expressive was his glance that a slower-witted man than Toulan might have seen that the impassive face of the Englishman was only a mask for a brave and strong spirit.

A light, indeed, was slowly kindling in Jean's eyes; a look of purpose had crept into his face. The Frenchman was watching him, and with characteristic quickness read his thoughts. He was measuring his interlocutor's figure for a leap upon him.

A half-smile ran across Toulan's face. He lifted his hands with an arresting gesture, opened the door of the room behind him, and, with a glance of his eye, drew Jean inside. Then he softly closed the door. The two looked at each other, and Toulan's face wore for the moment an aspect of irresolution. He walked two or three times across the room. Then he turned.

'Jean,' he whispered, 'that poor white-haired woman, that starved little wolf-pup—who would not pity them? Yes,' he said, answering the wondering inquiry in Jean's eyes, 'it was a trap. Lepitre said you were to be trusted, but we could take no risks. We wanted to test you. We have a plan for getting the queen out of the Temple. We want you to be in it, and we tried this business of the roll upon you as a test.'

The broken, hurried sentences by this time had become intelligible to Jean. There was a plot for the queen's release, and he had been chosen to take part in it. The message was a trick which put him in the power of the conspirators if they found they could not trust him, but it was also a test of his loyalty.

'It is a real message,' said Toulan presently, 'and it will stay where you placed it. The queen has had letters before in the same fashion, and knows where to look for them.'

Jean's consent to take part in the plot was wordless but expressive; and Toulan without hesitation went on to explain their plans.

(To be continued.)

SOME CHANGES IN BIRD-LIFE.

By the Rev. Canon J. VAUGHAN, M.A.

A COMPARISON of the bird-life in England to-day with what it was in former years is one of unusual interest. The comparison, it is true, cannot be extended beyond comparatively modern times. For though we meet with allusions to birds in many ancient records—in books on falconry, in 'household-books' (such as the Northumberland 'household-book' and that of the L'Estrange family in the days of Henry VIII.), in Shakespeare and other poets, in letters and papers such as those of the famous physician Sir Thomas Browne of Norwich—yet, except in the case of well-known species, the identification is not always clear and satisfactory. There is, of course, the *Ornithology* of Francis Willughby, edited after his untimely death by his friend John Ray, which appeared in 1676, and which contains references to

English birds; but the work deals generally 'with all the species hitherto known.' It was not till the year 1761 that Pennant's *British Zoology* was published, the second volume of which treats of 'British Birds.' Thomas Pennant, it will be remembered, was Gilbert White's friend and correspondent, and in his preface he gratefully acknowledges the information he received from the naturalist of Selborne. A few years later, in 1788, appeared White's own immortal *Natural History of Selborne*, in which village it might almost be said that the study of British ornithology took its rise. This book was the result of forty years' unwearied observation; White began his *Garden Kalendar* in 1751, and so carries us back to the middle of the eighteenth century. In 1797 Bewick published the first volume of his *History of British Birds*, a work still prized for the accuracy and beauty of its illustrations. The early years of the nineteenth century saw the appearance of Colonel Montagu's famous *Ornithological Dictionary*, followed in 1813 by his *Supplement*. Twenty years later Selby produced his admirable *Illustrations;* and in 1837 Yarrell began the publication of his *History of British Birds*. The third edition of this work, which appeared in 1856, contains the descriptions of no less than eighty-three species not mentioned by Montagu. Among other books bearing on ornithology which belong to the earlier years of the last century may be mentioned Gilpin's *Forest Scenery* (which contains much interesting information with regard to the birds of the New Forest), Colonel Peter Hawker's *Diary* and *Instructions*, and the *Sporting Journals* of the second Earl of Malmesbury, which range from 1798 to 1840. These latter works, it will be noticed, as well as Gilbert White's *History*, all deal with the ornithology of Hampshire.

Now, since the days of Gilbert White and of Colonel Montagu great changes have passed over the face of the country which have seriously affected the distribution of birds. These changes are due to various causes, such as the drainage of the fens, the enclosing of commons, the growth of towns, and the extension of railways. Kingsley's famous lament over the past glories of Whittlesea Mere will recur to many: 'Little thinks the Scotsman, whirled down by the Great Northern Railway from Peterborough to Huntingdon, what a grand place, even twenty years ago'—the words were written in 1867—'was Whittlesea Mere, where dark-green alders and pale-green reeds stretched for miles round the broad lagoon, where the coot clanked, and the bittern boomed, and the sedge-bird, not content with its own sweet song, mocked the notes of all the birds around; while high overhead hung, motionless, hawk beyond hawk, buzzard beyond buzzard, kite beyond kite, as far as eye could see. Far off, upon the silver mere, would rise a puff of smoke from a punt, and then overhead rushed and whirled the skein of terrified wild-fowl, screaming, piping, clacking, croaking, filling the air with the hoarse rattle of their wings, while clear above all sounded the wild whistle of the curlew and the trumpet note of the great wild swan. These are all gone now. Gone are ruffs and reeves, spoonbills, bitterns, avocets; the very snipe, one hears, disdain to breed.' The passage may be perhaps somewhat highly coloured, but it describes in a graphic manner the changes which followed the draining of the great fen. And so with other vast stretches of marshland, such as the fens of Cambridgeshire and Lincolnshire, of Holderness in the East Riding of Yorkshire, and of Prestwich Car in Northumberland, once the haunt of numberless water-fowl and the home of many rare species, now converted into corn-fields and grazing ground, where

> All the land in flowery squares,
> Beneath a broad and equal-blowing wind,
> Smells of the coming summer.

And as with the fens and marshes, so with the extensive stretches of common-land which formerly existed in England. In some counties these commons extended for miles. It was possible, for instance, to ride from Causton to Norwich, a distance of thirteen miles, without once leaving the turf. In Lincolnshire, too, they were very extensive, and each common, we are told, had its own pair of hen-harriers; even in Essex, until quite modern times, many of the roads were bordered with wide stretches of grass and rank herbage. These commons and wayside wastes have now to a great extent been enclosed and converted into arable land, with the natural result that many choice birds are gone. The great increase of population, with the consequent growth of towns, has also seriously affected the bird-life of the country; while in one instance a railway actually runs through the centre of what was formerly a famous decoy. To these causes, which have so conspicuously interfered with 'the old order' in the distribution of birds, must also be added the 'preserving' of game and the comparatively modern craze of egg-collecting. Our larger birds of prey have almost disappeared before the gun and trap of the gamekeeper, while the greed and selfishness of the egg-collector are responsible for the diminution almost to extinction of some of our rarer species. He has driven the ruff before its time from its last haunt in the British Isles; he has reduced the number of white-tailed eagles to two or three breeding-pairs on some outlying islands in the Shetlands; he seldom allows the honey-buzzard to rear its young in peace in the New Forest, or Montagu's harrier on the heaths of Dorsetshire, or the peregrine falcon on the cliffs of Freshwater. He has banished the beautiful little bearded-tit from the dense reed-beds of many a Norfolk broad.

But nowhere is the contrast between the bird-life in England to-day and that of former times more conspicuous than in the almost total disappearance of the larger birds of prey. In the olden times, when falconry was the sport of kings, all kinds of hawks were protected as pheasants and partridges are to-day. No hawk's nest was allowed to be

taken, and buzzards and kites as well as 'noble' peregrines reared their young in peace. Indeed, in medieval England the kite must have been a specially familiar object alike in town and country. It was protected not only for the sport it showed when pursued by falcons, but also as a scavenger, and was to be seen in all large towns, except where the raven took its place. A traveller who visited England in 1461 remarks in his journal that nowhere had he seen so great a number of kites as in London, and that the birds were so bold as to snatch bread from the hands of children in the streets. It was equally common in country districts, where it played great havoc in the poultry-yard. An interesting illustration, clearly the result of observation, occurs in one of the sermons of the famous Presbyterian preacher Stephen Marshall, who held a living in Essex in the days of the Commonwealth. He tells us 'how the Evil One lies in wait for the souls of men, and carries them off one after the other to perdition, even as a kite harryeth the brood of a hen, and leaveth none remaining.' Even a hundred years ago the kite was not uncommon in Essex; it bred regularly in the great woods near Hempstead, and doubtless in Marshall's old parish of Finchingfield. There are several allusions to it in Gilbert White's writings and in Lord Malmesbury's sporting journals. Gilpin speaks of it in 1834 as 'one of the most harmonious appendages of the New Forest;' and as late as 1864 it seems to have nested in the county of Hants. But with the increased preservation of game the days of the kite were clearly numbered; and now this splendid bird,

> That swims sublime
> In still repeated circles, screaming loud,

once the commonest of our birds of prey, is exterminated in England, while a few pairs only manage to maintain a struggle for existence in the wildest parts of Wales. And what has happened in the case of the fork-tailed kite has to a great extent taken place with other species of rapacious birds. Sparrow-hawks and kestrels, indeed, are common, but hen-harriers no longer breed as in the days of the second Lord Malmesbury, 'in great numbers yearly on Poole Heath;' neither do 'the moor-buzzards commit great havoc among the wild-fowl at Heron Court.' The honey-buzzard has altogether deserted its ancient haunt on Selborne Hanger; and the peregrine falcon has ceased to harass the teal on the moor's river. And with the larger hawks has disappeared the bird of ill omen. In former years the hoarse croak of the raven was a familiar sound in the country, and nearly every parish had its 'raven-tree.' It is now almost as scarce as its relative the chough, which in White's time 'abounded on Beachy Head and on all the cliffs of the Sussex coast.'

When Bewick engraved his well-known plate of the bustard with two greyhounds and a sportsman in full pursuit, that splendid bird was nearing the end of its existence in England. In medieval times it seems to have inhabited all the undulating plains and wolds from the British Channel to the Firth of Forth. In the seventeenth century Sir Thomas Browne speaks of it as 'not infrequent' in Norfolk, and Ray mentions it as inhabiting 'Newmarket and Royston Heaths.' Later on, an advertisement in Addison's *Spectator* for March 4, 1712, states that on the property of Heyden in Essex was to be found 'game in great plenty, even to the Bustard.' Towards the end of the century we learn from Gilbert White that the birds were occasionally to be seen 'between Andover and Winton,' and that 'at a distance they resembled fallow deer.' But with the dawn of the nineteenth century Colonel Montagu tells us that the bustard was 'almost extinct, except upon the plains of Wiltshire, where it has become very scarce.' A few years later it was gone from Salisbury Plain, though a few birds managed to linger on in Norfolk and Suffolk until about 1838.

But if we have lost some of our larger species, other birds have become commoner than in former years. There is a compensatory principle continually at work throughout nature. 'If a marsh is drained and subjected to the plough,' as Lubbock truly says, 'the call of the partridge is substituted for the cry of the lapwing and the snipe; if the same is planted, the wood-pigeon, the jay, the missel-thrush, the pheasant, and various others, creep in to fill up the vacuum, which "nature abhors."' The bustard, alas! is gone, and many of our larger birds of prey. The black grouse, formerly found on the wide heaths and commons of the south of England, has now in those parts become extremely scarce. The beautiful bittern, at one time a regular breeder in the fens, is now only an occasional winter visitor, and we are never likely to hear, with George Crabbe, as he wandered along the marsh near Aldeburgh,

> The loud bittern, from the bulrush home,
> Give from the salt-ditch side its bellowing boom.

And with the bittern has gone, in consequence of the same draining of the fenlands, the black tern, the godwit, the avocet, and Savi's warbler. But other species have increased. The cirl-bunting and the garden-warbler are common enough at Selborne to-day, though they are not mentioned by Gilbert White. When Bewick published his admirable work he seems to have considered the missel-thrush a rare bird. It cannot be said to be so now. As instances of this principle of compensation which pervades all nature, Lubbock in 1845 mentions the great increase in Norfolk, owing to 'the taste for planting which had arisen of late years,' of the turtle-dove, the ring-dove, the goat-sucker, the crossbill, and of the smaller birds generally. In White's time the hawfinch was clearly an uncommon bird; 'three of them,' he tells us, 'once appeared in my fields in the winter;' and indeed it was not known to breed in England until Mr Doubleday found its nest in Epping Forest about the year 1830. Yarrell frankly admits that

personally he was hardly acquainted with the bird, having 'never obtained more than a momentary glimpse of it.' Now it breeds regularly in many of the home counties, and can no longer be called a rare bird. In my own garden, situated not many miles from Selborne, it often plays great havoc among the greenpeas in summer-time.

A variety of causes have combined to favour the increase of our smaller birds, which in former years must have been terribly harassed by the numerous birds of prey. The hedgerows and plantations which followed the Enclosure Act were doubtless another factor in their favour. Churchwardens, again, no longer pay threepence a dozen for 'sparrar-heads,' which of course included those of any of the smaller birds. And there can be no doubt as to the excellent results which have followed the Wild Birds Protection Act and the efforts of the Royal Society for the Protection of Birds. It is now generally admitted that, with the exception of the Dartford warbler, our smaller species are steadily on the increase throughout the country. A conspicuous instance is the goldfinch, of which beautiful species I counted thirty-six together one day last autumn on Badbury Rings, near Wimborne, and two pairs last year nested in my own garden in Hampshire.

It is interesting to learn that, after the war of extermination which for many years had been waged against the golden eagle, the splendid bird, owing to the good sense of the landowners, is now decidedly on the increase in the Highlands of Scotland. Most interesting, too, is the report that a colony of the red-necked phalarope has lately been discovered in the north-west of Ireland, a country where before it was unknown. There also seems no reason to doubt that, as breeding species, the dotterel and the snow-bunting are both on the increase in Scotland. The woodcock now breeds regularly in many parts of England, and several kinds of ducks are spreading as breeding species in the southern and eastern counties. This is notably the case in the Essex marshes, where the nests of the widgeon, the shoveller, and the tufted duck may be seen every year. In one marsh, known as the Old Hall Marsh, in former years the site of a famous decoy, the pochard—'not known to breed with us,' wrote Colonel Montagu in 1802—now remains to nest every spring. It appears that some thirty years ago a female bird, having been 'winged' in the course of the winter, was unable to migrate with its companions when the spring season arrived. A gallant male bird remained behind with the cripple, and they successfully brought off their brood of young. The next year a second pair stayed behind, and now some twenty couples of pochards breed regularly every spring on the Hall marshes.

LAW IN LATIN-AMERICA.

N my way south I took the train from the city of Mexico to the city of Puebla. Part of the journey lies through the mountainous state of Tlaxcala, the smallest of the Mexican states, whose fierce inhabitants, never conquered by the Aztecs, cooked and ate the sooth-sayers who gave them bad advice, and became the allies of Cortes in the destruction of Montezuma. Their descendants of to-day are hardly reconciled to the presence of civilisation, and President Diaz does not hesitate to enforce order among them by the method they can best understand.

The railway passes through their country—against their will. At dusk the lamps in the car were lit, but shortly afterwards the conductor came round and carefully pulled down all the blinds. I asked the reason, and he said the people hereabout were *mala gente*, and it was safer to show as little light as possible. He had scarcely spoken when a stone as large as a cocoa-nut crashed through the upper window and fell behind my seat. '*Cuidado!*' ('Take care!') cried the conductor; 'they may fire also.' Several of the passengers crouched down, and I noticed that the train had suddenly increased its speed. Nothing more happened, and after a time the conductor announced that we were now out of danger. In reply to my inquiries I was told that the Tlaxcaltecos were a rude and fierce set of people, who had from the first hated the railway, and that some two years ago the train as it passed near two of their villages was almost invariably attacked with stones or guns. Complaint was made, but the culprits could not be identified. As the train continued to be assailed and the local authorities were unequal to the occasion, President Diaz was appealed to, and he at once sent instructions to the *jefe politico* of the district to arrest the delinquents. The *jefe* was unable, however, to find out who they were. The President then sent down a couple of troops of cavalry, with instructions to the officer in command to assemble the inhabitants of the two villages and demand that the culprits should be delivered up. If they were not, he was to select a dozen of the most probably guilty and shoot them without trial. The officer accordingly arrived, called the people together, and demanded that the men who had assaulted the train should be pointed out. No one, however, would either confess or inform on his neighbour, and the officer accordingly picked out twelve of the boldest-looking young men, ranged them up against a wall, ordered out a platoon, and shot them all there and then. After that there was peace for a while, but now it seemed as if the lesson were being forgotten and would have to be repeated.

With a good introduction, I had called on the President two days before, and had found

him the kindest, most courteous, most gentle of elderly gentlemen—he was born in 1830. But under his warm hand-pressure and almost affectionate greeting I had been conscious of something. I cannot describe it, but the recollection of it prevented me from feeling any surprise at the conductor's tale.

In due time I reached the region of the recently explored coffee and tobacco lands of the *tierra caliente*, and found myself far out of the way of any centre of civilisation. Perhaps I should not have reckoned myself so far if there had been a railway or even a good road within reach. But when a journey occupies many days, or even weeks, through steaming forests and over giddy mountain-passes, by roads which are at best mere bridle-paths, without bridges over the rivers or inns by the way, a distance short on the map is long indeed. I was, however, within reach of the Government, which, in theory, extended to me its protection, and, in fact, took care that I paid the taxes.

Of the famous rural police, into which Diaz's genius metamorphosed the rural banditti of revolutionary days, I had seen the last at the last railway station; but I found the law respected and feared, for every one knew that behind it was the swift, watchful, calm, indomitable President, whose arm is very long, and who never forgets.

Here, in a rural district of southern Mexico, the chief representatives of Government are the district judge, the *recaudador subalterno* (or local tax-gatherer), and the *jefe politico*. The *jefe politico* represents directly the executive power. He is charged with the maintenance of public order. His title may be roughly translated chief of police. Each of these officials receives a salary and 'perquisites,' the judge making probably the smallest income of the three.

The judge's salary is three dollars per day, that of the tax-gatherer one dollar, and that of the *jefe politico* three dollars and thirty centavos. Since the fall in the value of silver the Mexican dollar is worth only about two shillings, or half the value of the United States dollar, although in Mexico it retains its par value for the purchase of domestic products. It will be seen that the salaries of these officials are not exorbitant. In addition to his salary, the *jefe* has a share in certain so-called *honorarios*, while the tax-gatherer is allowed a commission of 8 per cent. on all he collects. The judge gets nothing extra except a secretary at one dollar a day and an allowance of twenty-five cents a day for *gastos menores* or petty expenses. Each of the three gentlemen, however, is said to avail himself of opportunities which occur in the exercise of his office for making friends of the mammon of unrighteousness.

The judge is a *licenciado*—that is, he holds a college diploma in law, and is a member of the Faculty of Lawyers authorised to practise in the courts. His tenure of the judge's office is only for two years, unless he should be re-elected. During his term of office he is not prohibited from carrying on such private practice as does not interfere with his judicial work.

The judge's court and the offices of the *jefe politico* and the *recaudador* are situated at the *cabecera* or chief town of the district. Each municipality, however, has its *presidente municipal* or mayor, and its *alcalde* or local magistrate. (*Alcalde* is one of the many Moorish words adopted into the Spanish language, the *cadi* of the *Arabian Nights*.) A village or other community not a municipality has its *agente municipal*, and in some cases an *alcalde* also. These petty local authorities are appointed for one year, and receive no salary. In the rural districts they are generally Indians, and frequently the *presidente municipal* can neither read nor write, knows but a few words of Spanish, and speaks with fluency only the Indian dialect of his tribe.

It was while I was living among the forests on the skirts of the Sierra Madre that I first made the acquaintance of my district judge. My place of residence was almost on the state border, and the chief town (it was really only a village) where his Honour lived was about three days' journey off among the mountains.

One afternoon a singular procession emerged from the forest into the clearing round my dwelling. First came a lean and gray-bearded man in a well-worn gray *charro* suit, the jacket showing his woollen shirt between its lower edge and the waist-band of his trousers, which were without the usual silver buttons down the sides, but fitted his thighs and calves as if he had been melted and poured into them. Wrinkled a little at the ankles, they were made so as to spread broadly over his boots like gaiters, and were rather ragged at the heels. On his head he wore a great felt sombrero with sugar-loaf-shaped crown and heavy tarnished silver braiding. He was mounted on a yellow pony, long-tailed, ewe-necked, and ungroomed. The weather-worn and well-rubbed wood of his saddle-tree had scarcely a scrap of its original parchment covering left. Some bits of frayed and greasy sacking were his saddle-cloths. The huge leather covers of his box-stirrups were dark with the wettings and caked with the dust of many a journey. A headstall whose rotten straps were mended here and there with cord seemed hardly fit to hold the rusty bit. The horse-furniture of this cavalier would indeed have seemed in the last state of dilapidation but for the presence of a still more dilapidated object which followed him. The second pony was a piebald, blind of an eye and minus one ear, and its accoutrements appeared to be held together by some clumsy arrangement of bits of string, and ready to fall to pieces should a knot or a strand of twine anywhere give way.

The first rider was thin; the second was fat, yet his rusty black coat was buttoned to the chin, although the thermometer showed ninety-eight degrees in the shade. He had a large white bathing-towel wrapped round his throat. Each man carried his travelling baggage—a bundle like a big, ill-

shaped sausage—strapped behind him on his saddle. Each wore on his rusty elastic-sided boots a pair of large and still more rusty spurs, their star-shaped rowels, fortunately blunt, some three inches in diameter. Each rode, after the fashion of his country, sitting upright in his saddle, his legs not bent at the knees but straight from hip to heel, his toes turned out very nearly at right angles to his steed, under whose small barrel there was plenty of room for the big spurs. Each held the loose reins of twisted horsehair with outstretched arm in the upturned palm of his left hand and lightly grasped between thumb and forefinger, as a railway traveller might hold out his ticket to the conductor.

Such were the figures which I presently found to be the district judge and his secretary. At the time I saw nothing absurd in their appearance. My own was weather-stained and worn enough. They were not incongruous with the crazy log hut, with palm roof and mud floor, in which I was living, nor with the wild country and their rough journey. The judge had that indescribable look in his face which showed him to be an educated man. He bore himself with dignity and self-respect as he descended stiffly from his Rosinante. Having sat down for a few moments and exchanged with me the cordial greetings with which host and guest meet in the backwoods, and taken a little glass of brandy, he begged us to excuse him and his secretary while they bathed in the river. He behaved with elaborate courtesy, striving always, with Mexican good manners, to give, and never to take, precedence, at no matter what cost of delay in our exits and our entrances, and at supper never helping himself to a dish till he had offered it to his neighbours on both sides. We spent a very pleasant evening. Over his coffee the judge discussed the late Spanish-American war and local affairs with quietness, deliberation, and good sense.

Like the majority of Mexicans of his class, and like the famous President himself, he is a *mestizo*—that is, he is of partly European and partly Indian race, sometimes a happy mixture, sometimes very much the reverse. I learned that he has a wife and family to support. He does not subject them to the hardships of his remote and temporary place of residence. They live in the state capital, where there is better education and more congenial society, and thither he will return on the expiry of his term of office should he not be re-elected. He told me he was now on his way to give formal possession to the purchaser of some lands acquired from Government. I gave him a bed, which he occupied without undressing; and next morning, after early coffee, he resumed his journey. In true Indian fashion, he postponed the business of his visit till the moment of his departure. It was to ask a small clerkship for his son. I observed also that he held some private discourse with an individual who had turned up, having heard of the judge's presence, and who proved to be a client with some business pending before the court.

The professional judicature being thus sparsely distributed, Mexican law compels the *dueño*—the landowner or his representative, and so the employer of labour—to assume in outlying places, even though he be a foreigner, the responsibility for local order. This he must do either by accepting the office of *agente municipal* or delegating it to one of his employés, who is appointed on his nomination, and to whom he must afford all facilities for the discharge of the official duties. Except by this means the State does not furnish police to perambulate his district and protect him and his property. It is the duty of the *agente municipal* in such cases to appoint a sufficient number of *auxilios*, of course selected from among the workers. The planter pays their wages and feeds them while they are on police-duty just as he does while they are hoeing his tobacco. The *agente*, too, who is probably an overseer or foreman, has to get his board and salary without any deduction for the time he employs in the service of the State.

There are, however, advantages to counterbalance the burden thus laid on the *dueño*. The employer of a large number of people in a remote district generally finds it very convenient to be invested with magisterial authority. Such offenders as do not require to be sent to a higher court can be tried at the place and time and punished in the way which will least interfere with their master's work. The punishment can be made not only to fit the crime, but also to fit the state of the crops. Petty offenders whose labour their employer is at the moment unwilling to dispense with—and the procuring of labour is probably his greatest difficulty—may be fined instead of being imprisoned. And if, as generally happens, they have no money with which to pay their fines, these can take the shape of a week's or a fortnight's labour. Such labour should, in strict observance of the law, be performed on another plantation; but the main thing is that the wages earned by it—that is to say, the fine—should be promptly remitted to the *jefe político*, which being done in due form, no one has any interest in taking further trouble about the matter. The *agente* is happy to arrange things to suit his employer, his chief satisfaction in his office being in most cases the feeling of 'importance' he has in doing so. Frequently he is quite incompetent to carry out his official duties without guidance, and is perfectly content to do exactly what his master tells him. This works very well, the master doing the business to suit the interests of the plantation as far as possible, while the man has the official responsibility.

The *agente municipal* on an estate with which I am well acquainted is the husband of the cook. He cleans the house, makes the beds, brings the meals from the kitchen, and waits at table. He cannot draw up any of the documents which his office constantly requires of him, but he can sign his name with the proper 'rubric' (the flourish) after it which the law demands, and he signs without question or

hesitation and affixes his official seal to whatever his master puts before him. Justice is administered without needless fuss or loss of time, and accommodates itself to the exigencies of business.

Everybody is ready to help with a will when he is under official direction and is told what to do, but scarcely any Mexican will act spontaneously on the side of justice or even fairplay. If two men quarrel, for example, and only one of them has a knife, so much the better for him and so much the worse for his opponent. It will never occur to the man with the knife to forgo his advantage, nor will the bystanders think of interfering to make them fight on equal terms.

The planter who, though against his inclination, is a magistrate, whether in law or only in fact, is expected to respond to the call of the *jefe politico* in case of any riot or public disturbance in the district by going to his assistance armed and mounted, and taking with him a force of armed auxiliaries proportionate to the number of his employés and his 'stake in the country.' The occasion for this does not come very often, but the annually appointed officials must always go to the chief town to make the statutory declaration and receive their commissions; and this means, if they are employés, a yearly trip and generally a holiday of a week or two at their master's expense.

The foreigner who engages in plantation in rural Mexico is apt to fret at first at such exactions on his time and money. He wonders what he pays taxes for, and thinks of the old saying about keeping a dog and having to bark yourself. He will grudge the cash outlay perhaps less than the interruption to his work. But in Mexico money is scarce and time is plentiful, and he at length learns to regard these tributes to the State as part of the unavoidable, though unanticipated, costs of his enterprise. For part of his outlay he is entitled to make a claim on the Government; but he will probably be wiser to write, with the assistance of a judicious Mexican friend, a letter to the *jefe* professing to minimise, but in reality recounting with emphasis and even exaggeration, what he has done and spent, and ostentatiously renouncing compensation. The Spanish language affords facilities for doing this to perfection. Afterwards he has only to let slip no opportunity of proclaiming loudly the importance of his services to the authorities and the generosity of his conduct. This course will be to his advantage in the long-run.

The great body of the Mexican people is not yet fitted to enjoy the full benefit of the republic's free institutions. President Diaz knows well the conditions under which the nation must advance, and the laws are framed in full view of the fact that the majority of those who have to obey them must be in the meantime, for good practical reasons, treated as children rather than responsible men. That they are grown-up children only makes them less easily managed.

There are clear and well-indexed criminal and civil codes for the guidance of the judge, so that he is not troubled by conflicting precedents or the perplexities of common law. It is at his peril if he departs by a hairbreadth from prescribed rule, and he is apt to pay less regard to justice, or even fact, than to the technical fulfilment of the requirements of the code. This has its drawbacks, for no code can fully anticipate and provide for every possible case. But it would not yet do in Mexico to trust to the rural, or even the urban, judge's unguided capacity; while his probity is too highly strained by his miserable pay and short tenure of office.

The procedure in criminal cases seems to the casual Scot to be in theory very philosophical and modern-republican, but in practice almost mediævally cumbrous. Founded on Roman law, it recalls the methods of the famous trial in Browning's poem 'The Ring and the Book,' with its separate examinations, written pleadings, secret deliberations, and its long-deferred judgments. The system of jurisprudence has not been naturally evolved with the growth of the people in intelligence, 'broadening slowly down from precedent to precedent,' but has been put on, like the rest of Mexican civilisation, from the outside, and does not yet quite fit. Relics of a barbarous time stick out here and there. But the Government does its best, and, considering the people it has to deal with, does wonderfully well.

LOOK UP.

Look up, look up, lest thou perchance shouldst miss
The glory of the heavens: the noonday sun,
The star-world o'er thy head, the tender kiss
Of dawn, the majesty of day begun.

Look up with new resolve for other sake
Than just thine own. Climb up the mountain steep,
Hard-breathing in the wind, that some may take
Fresh heart from thee ere eyes be closed in sleep.

Look up! for brave endeavour God doth call,
Life is too short for anything but love;
And His great truth for ever for us all
Shall light the weary road, heaven's arch above.

Look up, to give to life a nobler worth,
And speak high words of cheer when thou shalt find
One chance to be an angel on the earth,
A benediction to thy suffering kind.

Look up! What matter if with empty hands
Thou comest?—if thou foldest them to pray
Thou givest much to Him who understands
Life's mystery of pain from day to day.

Look up with fearless front, erect o'er strife,
Though dark the night and winterly the day.
Courage, oh toiler! let the door of life
Stand open wide for Christ to come that way.

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART XII.

MEMORIES of music and of those who made music cluster thickly about the old letters which are before me as I write. Both my father and my mother were by nature musical and had been well trained, the one to the violin, the other to the piano; and for many years their house was the gathering-place of those who were musically minded. In his uncompleted *Reminiscences* my father had meant, as I gather from a list of names on a loose page in his note-book, to speak of Mendelssohn, F. David, Ernst, Chopin, Moscheles, Hiller, Meyerbeer, Liszt, Thalberg, Molique, and many others too numerous to mention here. In regard to these I cannot supply his place, but I can say a few words about some others whom I myself remember and whose letters still remain to me.

Let me begin with a letter from my father to my mother, dated 24th July 1860:

'It was a quarter past 9 before I got any dinner at the club, and at 11 I made my appearance at the Hallés'. Had Hallé not happened to be on the landing and shaken hands with me as I came up I should never have been able to come near him or he near me the whole evening, so great was the crowd. Prince Galitzin was going as I came. His wife's English maid had that day died at her feet in a fit of apoplexy. They were terribly upset, and he is to take his wife away a little to get over the shock.

'As I entered the sacred temple the well-known priests and priestesses were there, officiating or performing their devotions. At the altar were Hallé, Santley, Belletti, and Mlle. Artot. The latter sang a pretty lullaby by Gounod, but may on the whole for my part vanish at once into infinite space, as Carlyle has it. Hallé played Chopins and Bachs, one *suite*, &c., which I had never heard before and which was quite enchanting. . . . Our friend ——'s nose glowed more powerfully than ever and paled the ineffectual lights of lamps and candles. I noticed that a young lady's dress (close to him) appeared pink, while (away from him) it was white.

'Among the devotees was Chorley, transparent, with rosy skin and yellow hair. He had drunk the elixir of life just in the right quantity last night, and was wonderfully youthful and frisky. Near him were the young and lovely Virginia [Gabriel] and the still younger and lovelier Volumnia [Miss Boyle]. Leighton whispered soft nothings into Virginia's innocent ears; the Prinseps with the Murillo daughter were attended by their henchmen Holman Hunt and Dick Doyle. Manuel Garcia told me the same story about Ernst playing a sonata of Bach's many years ago which I have patiently listened to twice before, and I fear strong defensive measures will have to be taken on the occasion of the next attack. Round this camp of gipsies a thin line of respectable heavy outsiders sat frigid, trying to overawe the turbulent mass, not without a certain effect. Lady Molesworth bestowed some of her amiable self on each of the two parties and still had plenty to spare. Mrs —— gave me her hand to kiss, but I regret to say it was covered by a washed glove which smelt strongly of turpentine. Everybody inquired after you. Chorley and I walked home together as far as the corner of Park Lane. He had recently made Holman Hunt's acquaintance at Gad's Hill, and was very much struck by the notion that he paints Christ from his own face. In "The Light of the World" there is certainly some similarity. He quite hugged this discovery, as you know he does everything which he thinks he has found out.'

Of Henry Fothergill Chorley I have a very distinct recollection, though he died thirty-five years ago. He was tall and thin. His eyes blinked and twinkled as he spoke; and his quaint pecking gestures and high staccato voice made an impression which caused one of his friends to describe him as the missing link between the chimpanzee and the

 [*All Rights Reserved.*]

cockatoo. He was a literary critic, a playwright, a writer of novels, all long since forgotten, and of operatic *libretti;* but he was best known as the musical critic of the *Athenæum*, the staff of which he had joined in 1833. In this capacity he for many years waged war against Schumann's music, and against Madame Schumann, who was endeavouring to make it known and appreciated in England. The genius of the dead composer and the noble efforts of his living wife eventually prevailed against Chorley; but for some years at any rate Chorley's campaign was conducted with a certain amount of success. In his private relations Chorley was friendly, affectionate, and sincere, with a strain of whimsical oddity which was the delight of his friends. One testimony, at any rate, to his true goodness of heart I can give in a letter written by him to my father when my mother was lying seriously ill:

'13 Eaton Place, West,
Tuesday, Jany. 26th, '65.

'My dear Lehmann,—I cannot tell you how sorry I am that you should have any anxiety now; but I *can* tell you that should you by any mischance (which may God avert!) want a relief, I am ready. I can sit up in any lower storey, without wanting to go to sleep, I can take directions, and I make no noise. I earnestly hope and believe that I shall not be wanted; *but* you would do me an unkindness if, supposing I could be of any good, you did not remember now how I am your obliged and faithful,

'H. F. Chorley.

'This note requires no answer save in the form of a summons.'

I now come to our dear old friend Sir George Grove—'G.', as he was always known to his intimates. The mere thought of him brings a burst of sunshine into the mind. There never was a man of more delightful humour or of a more abounding gaiety and amiability. Friendliness shone from his eyes and from every line of his face. Cheerfulness entered the room with him, and stayed even after he had left, so infectious were his spirits. He was all his life a very hard worker, but his enthusiasms remained fresh and unimpaired to the end. I was with my mother when he stayed with her at Portobello in 1896. He was my senior by thirty-five years, but I felt in his society as though the essence of youth and good-fellowship had become happily embodied in him for my especial benefit. Here was a man who had begun life as an engineer and had helped to float the tubes of the Menai Bridge; who had been secretary of the Society of Arts for two years and of the Crystal Palace for twenty-one; who had contributed many articles to the *Bible Dictionary*, and had for sixteen years edited *Macmillan's Magazine;* who had organised and edited a monumental *Dictionary of Music*, and had been director of the Royal College of Music—here, as I say, was this learned and versatile man of seventy-six frisking and laughing and chaffing and egging his companions on to laughter like a boy just released from school. It is a memory to be prized through life.

I think it was early in the sixties that my father and mother first came to know Grove, who was then, as he remained until 1873, secretary of the Crystal Palace and one of the presiding spirits of the famous Saturday Concerts. The relation between our two families soon became a very intimate and affectionate one. I have a letter of July 8th, 1867, from Grove to my mother in which he says: 'Thanks, dear friend, for your account of yourself. It is bad enough, but, thank God, not so bad as I had heard, last of all from old Chorley, who came trembling and crying to our gate yesterday morning quite a wreck of a wreck. Can't you keep yourself quiet, and recollect that you are a very weak, fragile creature, and also awfully valuable to all your friends, and put yourself into a big jewel-box and be looked at and aired only occasionally? Don't vote me a bore for preaching. Good-bye, my dear friend. Write to me again, and the sooner the better. I am going to dine with Arthur [Sullivan] to-night, and shall drink your health (to myself) with my first glass of claret.'*

The friendship thus established continued uninterrupted to the end of Grove's life. Here is another letter sixteen years later:

'Lower Sydenham, S.E.,
Oct. 8th, '93.

'My dear old Friend,—I have got an excuse to write to you which is very nice. The other day at Ragatz I met a lady and her husband who knew you and talked familiarly of many of our friends. . . .

'Why did I go to Ragatz? Well, my dear child, I went to cure my rheumatism, which bends me double, and makes me cross, and tires me, and is absurd. I have taken the baths all regular, and been massaged by a powerful Swede with an immense ball to his thumb. With that ball he not only rubbed and dug into the poor muscles of my back, but after each rubbing he slapped me with all his strength and his open hand till I was almost mad. *Souvenirs de jeunesse* he called it, but I never remember anything so cruel or hard to bear at school. When I began my muscles were all in lumps like potatoes. Now they are as tender and nice as a new-born baby's, and *yet* the rheumatic pains continue! What to do I don't know. I live a life of martyrdom. I have "cut off" my sugar, my wine, my beer—everything that makes life desirable, and yet I live in torture and am always on the point of breaking into two across my back.

'However, there are some consolations. I am doing a book on Beethoven's Symphonies, into which I am putting all that I know and feel. I mean it to be lively and readable; there'll be musical hints for those who like 'em, but what I

* I have to thank Lady Grove for permitting me to publish Sir George Grove's letters here.

want is to write a book which will "carry people away." I have done six of them, and have had the proofs read by one or two *test-objects*, and they give very good reports. It's splendid doing it. I get no time, but have to snatch half-an-hour now and an hour then, and so get on with it. I suppose it will be out about Easter. It's hard work, and 7, 8, and 9 are big mouthfuls to digest—and bring up again.

'When I got to Ragatz I went to see the resident doctor, who spoke English fairly well. When he had finished his instructions, I said, "I don't know your ways. What fee am I to give you?" "Oh," said he, "what you usually give." So I forked out a napoleon, and then I said, "You remind me of a story told about Macaulay. He usually shaved himself; but having hurt his hand, he sent for a barber, and at the end of the operation he said, as I did, 'What am I to give?' And the barber replied, as you did, 'What you generally give to the man who shaves you.' '*Then*,' said Macaulay, 'I should give you three great cuts on each cheek.'" The doctor pondered a little while, and then he said, "Ah, Macküläy! He was a historian?" "He was," said I, and fled.

'Love to any of you who are there, and to you.

'G.'

In the summer of 1894, when he was contemplating resignation of the directorship of the Royal College of Music, he wrote to my mother:

'You *are* a brick—nothing short of it—to think of writing to me like that—a regular little soap-bubble of a note, all floating about with prismatic colours of the sweetest and brightest! And it was very *à propos*—a great deal of aproposity about it (that's better); for I am sadly down on my luck—no, not on my *luck*, but overdone and tired and full of pain, and, oh my dear, *so* old! You can't realise it—you, somewhere in the fifties, can't feel with an old hulk, an old seventy-four, the *Téméraire*—that's it exactly.

'But, really and truly, my time's about come, and now that we've got into our new house [that is, the new buildings of the College] I must retire; only, there are two questions: Who's to succeed me? and, How am I to live? I can live on bread and cheese. Well, but even that will be hard to pay for with nothing coming in, for I shall never make anything with my pen. . . . I have not taken the plunge yet, only talked to Arthur Sullivan and Lord Charles Bruce. The last two months has been a bad time, and my factotum Watson (a splendid fellow) has knocked up—all but paralysis—and left everything to me. H.R.H. has been very kind, praised me no end, and spoke quite affectionately. . . . Do you know that, except Christmas Day, I have not had one day's holiday since I came back from Ragatz on October 2. I had planned a little run into Scotland—Kenmore, St Andrews, Portobello, &c., when Watson broke down and stopped it.'

The following letter also refers to his impending retirement at a later stage:

'Lower Sydenham, S.E.,
Nov. 28 [1894].

'My very dear Friend,—I wish I could come to the wedding, but I can't manage it, and I would have no talk to you. I am rather down on my luck. Nothing exactly the matter—rheumatism, of course—but horrible bad spirits and forebodiug, and an uncertain feeling which, I suppose, is inevitable under the circumstances. I do dread the next 3 months with their fogs and east wind and frosts.

'My people have behaved very well to me: have given me a handsome pension (quite enough), have put me on the Council, and have passed the most comforting and appretiative* resolution. I hope to give up at Christmas, and then Parry will succeed at the New Year. I am much comforted about him, and see a new lease of life for the College. Good-bye. We will meet again soon, when I have got my breath again. G.'

The last letter I have from G. to my mother is dated from Lower Sydenham, Nov. 17th, 1896:

'Dearest old Friend,—A 1000 thanks. I answer you at once lest you should be crowded out, though I fear I sha'n't interest or amuse you. I am anything but well: full of pain and of distress and fear. I lay awake from 4 this morning, fighting the devil—all about nothing, but just as bad as if I had disgrace and disaster before me. It's no use complaining, and as a rule I don't talk, but it is dreadful. I am just worn out with letters on mere routine that I have to write myself. . . . I have seen A. S. [Arthur Sullivan] twice. He was thin, but I thought his face very much improved, and *very* nice to look at. We were quite on our old terms, but I had only two words with him. I am sorry about the small houses in Edinburgh, but on the other hand the *Mikado* is doing well here. The fact is that in music now (as there was in painting in pre-Raphaelite times) composers and hearers worship ugliness—that is, directness in any art. There has come a turn or *kink* in the brains and heart-strings of composers: they have no affection, no love for their music. That divine quality which made Mozart, Beethoven, Schubert couch their thoughts in the most beautiful forms they could find, and return to their lovely phrases and subjects over and over again, giving the melodies to one instrument after another, with small appropriate changes, and loving it better every time they came back to it—that is now all dismissed in favour of sound and fury. "Slap into it—the more directly your thought is thrust upon your hearers the better; ugliness and smashing denote strength of feeling. So don't spare abruptness and roughness."

'And so the old school, with our dear Arthur as its latest product, must go, and wait in the back-

* Mr Graves, in his *Life of Sir George Grove*, points out that Grove always spelt this word and the words related to it with a 't,' in accordance with their derivation.

ground till the *fad* has passed and reason comes back. The same thing happened in literature too, Carlyle setting the example. But there's a purer air and a bluer sky behind. These thoughts were forced on me by Schubert's "unfinished" symphony last Saturday. But I've given you enough! . . . There's a nice article on me in the last *Saturday Review*. More anon. G.'

Arthur Sullivan was another of our intimate friends. It was through Chorley, I think, that we became acquainted with him shortly after he had come to London after finishing his musical studies in Leipzig. He was then organist of St Michael's, Chester Square, a post he retained until 1867, when he migrated to St Peter's, Onslow Gardens. Chorley and Grove were his devoted friends, and did all they could to promote the success of the brilliant young man.

The earliest letter I possess from Sullivan was written to me.* This is headed with a drawing of 'Ponsonby Castle, sketched from life and from the street by a distinguished Artist.' The 'castle' possesses no back or sides, but, on the other hand, its front has eleven windows, in addition to a stack of chimneys and a front door. 'The Artist,' in a large top-hat, is shown contemplating it from the left. In real life 'Ponsonby Castle' was 3 Ponsonby Street, S.W. There is no date, but internal evidence goes to prove that it was written on 2nd January 1863, when I was about to complete my seventh year:

'My dear Rudie,—I write to wish you many happy returns of the day—in other words, to tell you how I hope you may live to be a fine old man, honest, upright, and good, always doing what is right, and especially being kind and affectionate to your parents, for think what they do for you.

'Now the Sermon is over, we will proceed to lighter matters. In the first place, I shall be delighted to avail myself of your kind invitation for to-morrow which you did me the honour to send. The prospect of Tea and Buns which you hold out is far too tempting to resist, particularly as Buns are the one great comfort of my life—in fact, the sole object, almost, for which I live. If you could throw in a few biscuits and a pickled onion in red currant jelly my happiness would, indeed, be more than I could well bear. No more of this, however, until we meet.

'Good-bye, my dear boy.—Ever your affectionate friend, Arthur S. Sullivan,
his + mark.

'*P.S.*—[Here follows an assortment of complicated hieroglyphics.] This of course is between ourselves.'

Sullivan's music to *The Tempest* was played for the first time at the Crystal Palace on 5th April 1862. It had a tremendous success, and was repeated at the same place a week later. Here is a description of its production in Manchester in the following year:

'Greenhays, Manchester, *Jan.* 23, 1863.

'My dear Mrs Lehmann,—I shall tell you all about last night's proceedings, but in few words, for I have not ten minutes. First, however, on Wednesday I was received by Miss Hallé most graciously, who entertained me until the return of her parents to dinner. We went to the "Gentlemen's Concert" in the evening: very classical and, *ergo*, very slow—Hallé, Molique, Piatti, Reeves, &c. Then I was taken to a ball and shown about like a stuffed gorilla! Mrs Leister is the name of the hostess. There I met a Mrs Gleig or Greig, a sister of Rathbone's. She was very pleasant, and likes you and Mr Lehmann—wonderful exception to a general rule! I stood about the room in easy and graceful postures, conscious of being gazed upon; walked languidly through the lancers, and then talked a good deal to Mrs Gaskell the authoress; and at half-past 2 was in bed. The next day we went down to the rehearsal, where I met with a most enthusiastic reception by the band on being introduced by Mr Hallé. They played through the whole thing with good-will, and took no end of pains about it. Then I went and got shaved (!), had an Eccles cake, a glass of sherry, and a cigar—looked at a few things of Hecht with him; home to dinner; and then to the concert.

'I sat with the Hallés in the two front rows (I on only one, of course). A splendid hall and well filled—nearly 3000, I am told:

Overture, *Egmont* . . .	Beethoven.
Song	Miss Banks.
Music to *The Tempest* . .	A. S. S.!

'Well, I felt calm and collected, and smiled blandly at the few people that I knew. The "Storm" begins, ends, and is warmly applauded. Things go on. The 3rd Act Prelude, also warmly applauded, at which your correspondent looks gratified, and wishes that a certain friend of his could hear the way in which certain points were taken up and certain passages got through without bungle.

'However, the audience warms up and applauds everything, especially the 4th Act Overture, which your correspondent thought as near perfection as anything he had ever heard. The band was superb—so bright! Well, it is all over, and loud applause follows. The band applauds at me. Hallé leans over and applauds at me. The audience see that something is up, and continue. At last Hallé beckons to me to come up. I wink, I nod, I interrogate with my eyebrows, and at last rush madly from my seat and up the platform. When I show myself my breath is literally taken away by the noise. It is gratifying, though. I bow six times, twice to the orchestra (who throughout have been so kind and friendly), and shake hands with Hallé; then down again, and all is over. I stay

*I have to thank Mr Herbert Sullivan for permission to publish these letters from his uncle.

behind during the 15 minutes interval, and am overwhelmed with—not reproaches—from critics, artists, rich merchants with hooked noses, &c. One gentleman sitting near Mrs Hallé, seeing me rush away, said, "What! is *that* Sullivan, that boy?" (Oh that I had a dagger!) "I thought he was a relation of yours." Others thought I was a contemporary of Beethoven, or at least his immediate successor.

'Hallé won't let me go back to-day. He is teaching all the morning, and says he has much to say to me, and stay I must. Mrs Hallé waits now in the carriage to take me to a sewing-school! My love to the children.—I am, dear Mrs Lehmann, ever yours, ARTHUR S. SULLIVAN.'

In 1866, when Sullivan was only twenty-four, he suffered what he himself describes as the first great shock of his life in the death of his father. In the following letter he pays a beautiful tribute of sorrow and affection to his father's memory:

'47 CLAVERTON TERRACE, S.W.,
Thursday night, 18 *Oct.* 1866.

'I was very glad to get both your letters. . . . In great pain of this kind one holds out one's hands in an agony to see if any one will clutch them and press them even for a moment only, and it would be sad to hold them out in vain. And what agony, what real physical pain it is when the first great shock of one's life comes!

'I was at Sydenham on the Saturday night, asleep; and in the middle of the night was awaked by the servant to say my brother was there. I thought my brother wouldn't come down at 4 o'clock in the morning without some reason, and then he entered himself, looking so pale and odd. He tried to tell me quietly, but broke down at once. I got up and dressed, and then went out into the pitch-dark night, and together we drove home in a hansom which was waiting at the gate, and gave out a little faint glimmering light in the midst of the terrible darkness.

'Oh, that was a dreadful night! My dear father went to bed shortly before midnight, and at twelve he was dead. He slept in the dressing-room next to my mother's bedroom, and was already in bed when she came up. He called her and complained of a pain in his side. . . . She ran for a doctor, but it was too late. She was only away a few minutes, and before she returned he was gone. He never spoke a word, but gave a long sigh and died.

'My dear, dear Father, whom I loved so passionately, and who returned my love a hundredfold if that were possible! Oh, it is so hard—it is so terribly hard—to think that I shall never see his dear face again, or hear his cheery voice saying, "God bless you, my boy." . . . I am able to be strong all day for my poor mother's sake, who is nearly broken-hearted (they have been married thirty years, and known each other intimately nearly fifty!); but at night, when I am alone, then the wound bursts out, and I think of him and his tender love and care for me, and his pride in all I did—and now he is gone for ever. Perhaps he can look upon me and see all I do; and please God I will try and never do anything that will make him turn away his head and regret that he left me alone here. . . .

'Keep me in affectionate remembrance.—Ever yours, A. S. S.'

I give the following letter because it contains a reference to another bright and joyous spirit too soon withdrawn from the affection of his friends. The 'Freddy' mentioned by Sullivan was Frederic Clay, the composer of much beautiful music. His opera *The Golden Ring* was produced at the Alhambra on 3rd December 1883, amidst warm demonstrations of popular approval. As he was walking home from the theatre after the performance he was struck down by paralysis; and, though he afterwards rallied to a certain extent, he never recovered his full powers. He died at Marlow in 1889. I have a letter from him to my mother, undated, but evidently written a few days before the fatal 3rd December, in which he says:

'Will I dine with you on the 13th? *Won't* I, indeed? Yes, with all the pleasure in life, and my only regret is that the date is so far off!! I am ordering some new evening clothes, as I believe I am getting too shabby. I hope they will be ready by the 13th.

'If I make a failure at the Alhambra I don't know what will happen. I shall never have heart to dine at all any more—so let us hope I shall pass muster on the opening night.'

Here is Sullivan's letter to my mother:

'QUEEN'S MANSIONS, VICTORIA STREET, S.W.,
22 *Jan.* [1884].

'Bless you for your kind words and loving thought of me. I am all right again now, but a little bit pulled down, and am off next week somewhere—whither I know not yet. I saw our precious old Freddy on Sunday for the first time. He is bright, cheery, full of appreciation and sympathy; but, alas! speechless still. How awful it is!'

I began my budget of Sullivan letters with a letter about a birthday. I end it with another written to my mother about a birthday thirty-two years later:

'QUEEN'S MANSIONS, VICTORIA STREET, S.W.,
29 *May* '94.

'Yes, I had a birthday about a fortnight ago (13th), but I sha'n't have any more. I am 52, and it is time celebrations should cease. Do you remember that I spent part of my 21st birthday with you, and —— I forget the others; and with every gaiety of London open to us we chose the delirious dullness of Madame Tussaud's! It seems a very short time ago. How many of our own relations and friends have gone off since then!—even Edmund Yates has succumbed.

'I only see Nina about once a year, and when I do see her I always feel as if I never wanted to see any one else—such is real love, isn't it? Am I

never to see *you* again? Is Bourne End to claim you all the time, or shall you be in London, or will you come and stay with me at Walton—also on the Thames?

'Well, in any case let me know when you come south, and I will make (if necessary) herculean efforts to see you. What a lot we shall have to talk about!'

A PAWN IN THE GAME.

CHAPTER XXII.—PLOTS.

THAT night, as Jean lay on his rough bed in the darkness, he went over, with fresh wonder, the events of the day. He was suddenly caught in an eddy of the great underground stream of plots and conspiracies flowing through Paris. And the thought that he might help that sad and queenly figure in the Temple fired his blood. It was the very business which brought him to Paris. But was escape possible? Surely a more hopeless task was never attempted by the wit of man!

There were four to be delivered, three women and a stupid and helpless child. Were they birds, that they could fly? The Temple swarmed with spies and officials. The unhappy prisoners were never left alone, even at night. No one could come into the Temple without a card of entry or go out of it without the closest scrutiny. There was access to the rooms by only one flight of stairs. It passed three floors, and each was full of guards. What art would serve to bring the stumbling feet of that little flying group past all these defences and through the jealously guarded outer gate of the Temple itself?

If by some miracle they were brought out of the Temple, what remained? Paris was fermenting with hate. It was a city of informers and spies. The unhappy captives were well known. Every street through which they passed would be a whispering gallery; the very pavements would cry out against them as they fled. They were friendless. What roof would shelter them?

Yet what is impossible to human wit and courage? Lepitre was hand in glove with Toulan in the scheme. The king, as it happened, had once flattered his pride as a scholar. When in the king's room on one occasion he asked permission to take a Virgil from the shelf.

'Do you know Latin?' asked Louis with surprise.

'Yes, sire,' answered Lepitre; and then, with a scholar's readiness, he quoted the lines:

> Non ego cum Danais Trojanam exscindere gentem
> Aulide juravi!

The king smiled, and from that moment treated Lepitre with a respect which flattered him. No doubt the opportunity of helping to deliver a queen tickled Lepitre's vanity and predisposed him to take part in the scheme which Toulan's more daring brain had framed. The imagination of the old pedagogue had taken fire at the thought of having part in a great conspiracy. He almost believed himself to be one of Plutarch's men!

Jean shook his head when Lepitre's part in the plot was explained. He knew his old teacher too well to imagine him taking a successful part in a scheme which involved tremendous risks. No gleam of courageous fire burned in those goggle eyes. But Toulan was confident.

'He is to have his price, and he is the president of the Passport Committee. He can give us the papers we need, and we cannot do without him. We talk with the queen as often as we like,' he added exultantly.

Jean looked astonished.

'But the trick is simple.' And Toulan went on to explain it.

When the commissioners met in the guardroom they distributed their duties by lot. Discipline was careless, and often three commissioners only made their appearance, two of whom were always Toulan and Lepitre. When this happened, Toulan wrote the word 'day' on all three tickets. The third commissioner was given his choice first, and drew, of course, a card with the word 'day' upon it. Toulan and Lepitre then threw their cards into the fire, as though they necessarily carried the word 'night.' In this way they secured the night duty to themselves almost at pleasure. So there was concert betwixt the prisoners and those who were plotting to deliver them.

Toulan was the heart and brains of the scheme. His fiery Jacobinism had been genuine enough at first. He was a Southerner, vehement and passionate—if fickle—like most Southerners, and in the early stages of the Revolution he had won fame as an orator of the pavement. He had played a daring part in the storming of the Tuileries; he was a member of the Jacobin Club and of the first Commune—one of the fiercest, indeed, of that crowd of fierce spirits. He still lived on the credit of those early exploits.

But his Jacobinism now was only a mask. What miracle had so strangely changed the man who led the assault on the Tuileries on August 10 that he was now plotting to deliver the once-hated queen? No doubt the pathos of the silent group in the Temple—two helpless women and two children—had touched his quick, Southern nature. Disappointed ambition, too, counted for much. Others who had done less than he had risen to high posts; but he was still only a clerk

in the Emigrants' Property Office for the Paris district. He was of a combative nature; and to pit his wit against the comrades of whom he had grown weary, and whom he despised, was in itself a temptation. Then, to be the deliverer of the Queen of France! Yes, Toulan was heart and soul in the great enterprise!

The four conspirators, Toulan, Jarjayes, Lepitre, and Jean, met frequently at the room of one or other of them, and in these brief conferences Jean, somehow, came to play an important part. The look of dullness was only a veil for a keen and daring spirit. His shrewd, practical sense amounted almost to genius; and he knew one section, at least, of Paris—the Paris of alleys and slums—better than even his fellow-conspirators.

The plan that grew into shape was simple and daring—not to say audacious—but seemed likely to succeed. Certain officials could enter the Temple without cards and leave it without close scrutiny. Amongst these was the lamplighter, with his two lads, who came every evening about dusk, went the round of the lamps, and left about nine or ten o'clock. The sentries were familiar with the figures of the man and his lads, and passed them both in and out as a matter of course.

To attempt to buy the lamplighter was perilous. The very offer of a bribe would show that some disloyal design was on foot. But Toulon, a Jacobin of the Jacobins, was beyond suspicion. He could pretend that a friend—a good patriot—wanted to see the Temple and the queen, and without exciting suspicion could ask the lamplighter to give up his office for a single evening.

Public attention, as it happened, had for the moment ceased to be fixed on the Temple. The fierce duel betwixt the Girondists and the Mountain, now moving fast to a climax, turned the Convention itself into a field of battle, on the issue of which all Paris was hanging day by day. As a result, there was just then some laxity in the watch kept in the Temple; and the care of the prisoners, through the clever tactics of Lepitre and Toulan, had fallen almost exclusively into their hands.

There was much careless coming and going of commissioners at the Temple. On a given night Toulan and Lepitre would arrange to be in sole charge of the queen's room. The queen and her sister-in-law were to be disguised as municipal officers, with long cloaks and scarfs conspicuously showing. The broad-brimmed hats would hide their faces. There was no difficulty in procuring for them cards of entry, if by any evil chance they were challenged. The queen's daughter, Madame Royale, was to be disguised as one of the lamplighter's boys, and clad in a dirty pair of trousers and a carmagnole jacket. The little dauphin was to be smuggled out in a basket by Jean himself.

How could a child of eight be packed, it may be asked, into a basket? But the dauphin was little better than an attenuated dwarf. Long afterwards there used to be pointed out on the wall of the room in the Temple a mark showing the height of the boy, with an inscription by Marie Antoinette herself: '27th March 1793: 1 m. 026'—that is, exactly three feet two inches—less than the length of a clothes-basket.

There remained the two personal attendants on the prisoners—a sly and dangerous pair named Tison and his wife, hated and feared as spies by the queen. They were to be drugged, or, if necessary, seized, gagged, and thrown into the little tower-room opening from the queen's chamber.

The escaping party were to leave in pairs, with an interval betwixt each, Jean coming last, with his basket containing the prince. Once outside the gate they were to turn to the left, into the Rue de la Corderie—now the Rue de Bretagne—and Jarjayes had arranged for vehicles and relays of horses to the Normandy coast, whence a boat would take them to England.

Yes, the scheme was plausible, clever, daring. But Jean was no imaginative Frenchman. His stubborn English sense made him uneasy. There was a weak link in every chain. What was the doubtful human link in this? Not Jarjayes—he was a loyal gentleman. Not Toulan—he had nerves of steel and was whole-hearted in the plot. It was Lepitre. Jean, by a sure instinct, felt that behind the dim goggle eyes, the loose mouth, the shallow vanity of his old teacher there was neither courage enough nor loyalty enough to keep him unshaken in the tangle of perils through which the conspirators must pass, where a gesture, a careless word, a suspicious look, must bring arrest and death.

'He will fail you,' he said to Toulan with conviction; and Toulan could only answer with a fierce Southern execration.

The whole scheme stood ready to be put into effect. Each day of waiting increased the chances of failure. Of the four conspirators three were keen for action; but Lepitre doubted, hesitated, and day after day brought excuses instead of passports. Jean could hardly meet the queen's challenging eyes asking dumbly each time he entered her room, 'Is this the moment?' Each member of the little group of conspirators in turn tried to harden that lump of human jelly Lepitre into consistency, but in vain. The queen gave him a lock of her hair; the Princess Elizabeth knitted a cap for him. But the owner of the head beneath that cap had no intention of ever putting it beneath the steel of the guillotine.

And while the conspiracy thus refused to execute itself, the shock of external events changed the whole situation. There was a rising in Vendée. The little, sulky, stupid-looking boy was proclaimed as Louis XVII., and men were killing and being killed in his name. He suddenly became a supreme counter in the game of revolutionary politics, and a new vigilance stirred amongst his jailers. The allies were thundering on the frontiers of France.

Aix-la-Chapelle had surrendered. Dumouriez had played a traitor's part and gone over to the enemy. The sullen boom of the far-off guns on the frontier seemed to shake Paris with their vibrations, and the eyes of the crowd turned with new and gloomy menace on the Temple and its little band of prisoners who, in a sense, were the hostages of the Revolution.

Lepitre came with affrighted face one afternoon to Toulan's room.

'It is useless,' he said, with agitation; 'she is doomed. We shall only share her fate if we go on with our plan.'

He proceeded to explain that on his way to meet his fellow-conspirator that afternoon he had heard the cry, 'Death to the Austrian!' raised amongst the crowds *thirteen* times. He had counted; and though—like many other revolutionaries—Lepitre had emptied his mind of all religious faith, he had not cleansed it of superstition. And the number thirteen to him was fatal.

Toulan saw that to press Lepitre further would be dangerous, and he and Jarjayes began to weave plans which left their former comrade out. But their sole chance of securing the necessary passports rested with Lepitre, and his breakdown practically destroyed all hope of escape.

Such is the satire of history, however, that of this cluster of conspirators, Toulan, who was absolutely loyal, lost his head under the guillotine; and Lepitre, who destroyed all chances of success by his want of nerve, outlived the Revolution, saw the return of the Bourbons, and was made Knight of the Royal Order of the Legion of Honour as a reward for his part in a conspiracy which his cowardice had defeated!

(To be continued.)

AN OCEAN BACKWATER.

THE steamer-route from England to India can be pictured, with no great stretch of imagination, as a six-thousand-mile river running through the sea instead of the land, with London, Marseilles, Port Said, Aden, and Bombay as towns on its banks. This ocean-river is as well defined as any other river as to breadth and boundaries; a veritable highway of commerce, where ships do not leave the beaten track. It is traversed by hundreds of vessels every year, and its familiarity as a traffic-stream may be gauged by the fact that the intermediate P. & O. which runs between Bombay and Aden is generally referred to by Anglo-Indians as 'The Ferry.'

Stretching away to the north and west from the beat of 'The Ferry' lies a great ocean backwater, remote, secluded, and full of interest—the Persian Gulf. Once one of the world's highways—thronged with perhaps more, though smaller, vessels than the great Indian traffic-stream of to-day—it is now a backwater; and how remote it is can best be grasped by following in thought the route of the traveller who would visit it. He must first take the six-thousand-mile trip to Bombay; then tranship into one of the fine British India turbine-steamers and make the run to Karachi—five hundred miles; then, transhipping again into a smaller vessel of the same line, he must go another five hundred miles westward, almost parallel to his eastward route of a week ago, until he comes to Muscat. Even here he has not come to the Gulf itself; but the same steamer will take him on right to the uttermost end of the backwater. And his trouble will be well repaid, for the Persian Gulf is one of the most interesting places in the world.

One reason, possibly, why this region is not much sought after, even by those who have heard of its wonders, is the fear of its hot climate. And certainly during the greater part of the year the Gulf is as hot a place as can be found on this globe. The thermometer does not, it is true, often reach one hundred degrees, and seldom exceeds that point; but, then, the thermometer is no true criterion of heat; and here the heat is so terrific in summer that the men on board the British gunboats which continually patrol these waters do not care about appearing on the upper deck more than they can help during the daytime; and even the nomad Arabs, who make a brief settlement for a few months in the year, and essay a little cultivation, are obliged to quit their valleys and seek the heights where there is a breeze, even though it is a hot one.

But it is not always like this in the Gulf. In the months of March and April the climate is almost ideal—hot enough, certainly, in the sunshine of the daytime, but never too hot for walking ashore or sailing a boat; while the nights are cool enough to require a couple of blankets on the bed. At such a time should the traveller visit the Gulf he would at once feel that he had reached a place which seems hardly to belong to this commonplace world. Even in the bright sunshine there is an eerie appearance about the waters of the Gulf, there is a gleam and a shimmer, mirage and mist. Distant objects appear distorted, the sky and the sea blend imperceptibly, and both appear equally unreal and impalpable. On the oily surface of the pale-blue sea swim venomous water-snakes, banded black and yellow, writhing slowly along; they have been known to climb the cable of a ship at anchor and make their way in through the hawse-pipe. One would scarce feel surprised to see a dragon flying overhead. And on land and sea there is stillness and silence. It is a place of Enchantments, a Land-where-anything-might-happen.

At the very entrance of the Gulf lies an island—

Ormuz—which shows in the distance like a fairy isle. On the seaward side it is composed of a mass of conical hillocks towering one above another, and each of these countless little hills is of a different colour—rose, orange tawny, pale blue, mauve, chocolate, purple, and dazzling white—mineral deposits, of course; but the effect in the sunlight is magical and intensely beautiful.

At the back of this same island, where it is more level, are the ruins of a very large fortification, a relic of the days when those wonderful early empire-builders the Portuguese made themselves masters of most of the coast-line of the Indian Ocean. There are other such ruins at Bushire, where to this day the most casual scratching of the earth will bring to light fragments of Portuguese pottery, coins, and such-like archæological treasures; and at Muscat the little harbour is flanked by two Portuguese forts still in very good preservation. Indeed, the Sultan of Muscat still uses the guns of these forts to return the salutes of men-of-war. But the ruins at Ormuz are the most perfect of them all, and the largest; for this spot commands the entrance to the Gulf, and had to be strongly garrisoned. It once mounted five hundred guns, of which a good number still remain; and the large fresh-water reservoirs are to this day in an almost perfect condition.

At Bahrein, about half-way up the west coast, there are traces of a still older civilisation—the oldest in the world, some think. Here there is a plain covered with innumerable tumuli, the graves of a forgotten race. Only very recently has the work of exploring these been taken in hand, and the result of the investigations points to a likelihood that the men who made these barrows were the forefathers of the human race. It is a curious coincidence that the alleged site of the Garden of Eden lies not so very far away. It has been proved that these ancient inhabitants of Eastern Arabia were akin to the Chinese in natural features and in language, but in both respects of a much earlier and more primitive type. It is, therefore, more than probable that Chinese civilisation, formerly believed to be the oldest in the world, owes its origin to that which is now being investigated at Bahrein. Up to comparatively recent times the Chinese are known to have kept up a regular communication with the Gulf countries in their sailing-junks. What a field for the archæologist lies here, almost untouched, and till lately unsuspected!

The coast below Bahrein is known by an ominous name—the Pirate Coast. In olden days the Gulf waters swarmed with pirate-vessels and slave-dhows. Now that the Gulf has become one of our 'spheres of influence,' and our gunboats patrol its waters with ceaseless vigilance, the state of affairs has vastly improved. Yet it would be a mistake to suppose that piracy and slavery are totally suppressed; and a little gun-running may sometimes take place, solving the problem as to how the hill-tribes of the north-west Indian frontier obtain the weapons wherewith to fight our troops. But detection is difficult, as the most suspicious-looking dhow is always willing to be overhauled and to prove from her absolutely correct papers that she is an innocent trading-vessel, sailing perhaps under the protection of some foreign flag!

Bahrein itself is noteworthy also as being the head-quarters of the pearl-fishery (as well as the piracy) of the Gulf. Hundreds upon hundreds of pearling-dhows assemble here in the season, some of them beautifully built, with high, square sterns carved and windowed like that of the old *Great Harry*. The divers perform wonders in their art, staying under water for an almost incredible time. They work only in summer, for at other times the water becomes too cold.

Koweit—pronounced Kwate—at the head of the Gulf, affords a good example of the patriarchal style of living which prevails everywhere. The sheikh, or his son—for the sheikh himself is an old man—comes daily into the market-place to dispense justice to all comers. He takes his seat upon a stone bench which runs around three sides of a building open to the air in front, and there he listens to rival claimants in civil cases or decides the fate of criminals. His decisions are never questioned, and are carried out immediately. On these occasions, or in the afternoons when there is no judicial business, the sheikh receives his friends in the same place. Coffee is handed round, poured from a huge brass flagon with a long curved spout into small china cups without handles. Only a very few drops are poured out at a time, scarcely a teaspoonful, and the cup is constantly replenished; the idea being that each drink, or rather sip, shall be really hot.

The sheikh is a venerable old man who obtained his rulership a few years ago by killing his brother with his own hand. He ought, according to all precedent, to have proved a cruel and wicked tyrant; but as a matter of fact he is a wise and benevolent ruler, and governs his small dominions in an exceptionally able manner.

Koweit is on the edge of a desert; and just behind the town, at the time when the present writer visited it, was a large encampment of Bedouin Arabs, with their tents and camels. They had come hundreds of miles from the interior to sell the coarse black wool of their desert sheep. The camels lay knee-haltered on the ground or walked about awkwardly, but more quickly than one would imagine possible, on the three unfettered legs; and it was a difficult, not to say dangerous, matter to pick one's way amongst them.

The Bedouins themselves are small, wiry men, markedly Semitic in type, olive-complexioned, with keen hawk-like eyes and black ringlets, and are charmingly polite to a stranger. They have wonderful powers of endurance, and are able to sustain life for four days, or even longer, without water. This faculty stands them in good stead at times; for it occasionally happens on their desert journeys that

they reach a longed-for well only to find it occupied in superior force by a hostile tribe, when they are obliged to go on to the next well, perhaps a hundred miles farther!

Koweit has been mentioned as a possible terminus for the projected Bagdad railway. If ever it becomes so it will be an important place. Then, when the railway winds its way through Asia Minor, Syria, and Mesopotamia, there will be a real overland route to India; and it will be possible to travel from London to the Middle East all the way by land, save for the chops of the Channel and the blue Gulf waters. If ever this comes to pass, the Persian Gulf will once again be one of the world's highways, and no longer an Ocean Backwater.

THE GOLD OF THE 'GUNSIGHT.'

PART II.

THE fresh relay was awaiting him at the proper place; and, dragging his stiffened limbs from one horse on to the other, he galloped on. How that last ten miles was done Langton never knew. He had a confused recollection of urging his horse along the narrow trail and up steep mountain grades, of snow-laden branches hurling their white burden upon him as he passed under, of icy twigs cutting across his face as he dashed through them, of feeling a grateful warmth as he entered some sheltered valley where the sun shone brilliantly, making the white snow a blinding field of diamonds. He remembered flying beneath the great pines, and seeing their blue shadows on the snow race past him, and of plunging into the gloom of the cedars crowding the cañon up which the precious mine lay. It was all dream-like and indistinct; he only knew he was faint with hunger and chilled to the bone. He wondered if he would be able to make his way through the deep snow and put up his notices of location on the trees he had already blazed for that purpose.

The twelve hours had passed, and Rodda and Anderson—the former booted and spurred, and leading a saddle-horse—were waiting at the ferry.

Where in the morning there had been only a narrow trail through the snow was now a broad space, beaten smooth and hard by the feet of hundreds of men and horses who had crossed that day to the opposite shore in their mad rush for gold. Many had already put up their notices, and hurried back, to go galloping away to the county seat, fifteen miles distant, to place them on record.

'Do you think he has played off on us?' queried Anderson, as Rodda stopped for a moment to stamp his feet.

'No,' replied Rodda sharply; 'more likely if he and Palmer got on the ground together one or both of them were shot.'

'Well, there's no use in staying here to freeze. We may as well go up to the hotel, where we can be warm at any rate,' said Anderson; and, with a last look to the opposite shore, they turned away.

As they reached the hotel a rider reined up at the door. The horse stood with drooping head and trembling limbs as the man climbed stiffly down.

Rodda darted forward. 'Why, Langton, how did you'—— he began.

'Came by the upper ferry,' answered Joe laconically. 'Here's copies of your notices; take 'em and ride like fury.'

But Rodda was already in the saddle and galloping away on his night ride to get the precious papers on record.

'The "Gunsight's" ours,' said Langton as he tumbled up the steps. 'Give me a bowl of whisky. I'm dead-beat.'

The mirth at the 'Miners' Rest' was at its height; violins shrieked and groaned, mingled with the shuffling of heavy-booted men and the light slippered feet of women. The sound of shrill laughter blended with the clink of glasses from the gorgeous bar at one side of the room, and at the various small tables sat couples drinking and smoking or watching the flying feet of the dancers.

Suddenly, above the babel, another sound was heard, and a bullet went crashing through the immense mirror which made a background for the bar. Shrieks, no longer of mirth but of terror, arose from the women, mingled with oaths from the men, as all rushed for the nearest places of exit.

At one end of the room, where the light from the chandelier shone full upon him, stood a tall, powerful man, dressed in drab cords; his broad cowboy hat—or sombrero, as it is called out West—was pushed back, exposing his drink-flushed face and gleaming blue eyes. In either hand he held a six-shooter, which was pointed at the fleeing mob before him, pushing, struggling, climbing over each other in frantic efforts to get out of the door or windows before the next shot came.

'Go ahead with the dance! Don't be scared! What's the matter? You all know me, and that I can put a ventilator in your hat and never cut a hair. Come back, my pretty dears, and I'll show you how I can cut the heels off your little slippers and you never know it. What's your hurry? Wait and see me snuff the candle.'

Another report, and one of the lights went out. A fresh chorus of shrieks, and he had

the room to himself, the two bar-tenders having promptly dropped behind the counter at the first shot, and under its shelter worked their way to an exit.

'All gone,' laughed Langton. 'Don't want to see me shoot. I'll empty the guns, anyhow.' And a fusillade of shots extinguished the lights in the chandelier and brought a shower of its glass ornaments tinkling down. Then, shoving his revolvers into his hip-pockets, Langton staggered to a small red velvet sofa, and, stretching himself upon it, elevated his feet to a small table, which overturned with a crash, scattering glasses and decanters in all directions.

'Nothing steady in these yer places,' said Langton as he drew up his feet and settled himself to slumber. 'Ain't very steady myself.'

The lights flared in the breeze from the open door and windows, and shone red on a pool of claret that had poured from a broken decanter, looking like blood as it spread and dripped from the white marble bar. The murmur of the river came gently from without, and Langton slept.

The wind was blowing with terrific force across the high bridge at Forest City; but there was no one to feel its chill, as it was midnight, and the few pedestrians who were out avoided, if possible, that bleak and dreary way.

We said no one to feel it; for it is doubtful if the little, black-clad figure that stood grasping the iron railing with a clasp that instinctively tightened as a sudden wild gust made the bridge sway and quiver under its power gave any heed to the storm. The thin little fingers that clutched the iron bar were so cold that the numbness which was penetrating her chilled frame was unfelt, as she stood gazing down, as if fascinated by the black depths beneath her, where the river surged and tossed up ghostly arms of white spray, as the water of the great falls plunged into the chasm with a terrific roar.

She stood motionless, a shadowy little form, neither child nor woman, just revealed to sight by the rays of the pale winter moon. By the same fitful light a man might have been seen approaching from the other end of the bridge with unsteady steps.

The girl gazed a moment longer at the black waters, and then, putting her foot in an interstice of the ironwork, began with difficulty to climb the railing. She had reached the top, and was putting one foot over the side, when a hand grasped her arm and a voice exclaimed, 'What are you doing?'

She turned and looked at her questioner dumbly, and then began slowly to climb back again.

'What are you doing?' asked Langton—for it was he—when she stood once more on the floor of the bridge.

'Nothing,' was the response, as she leaned against the railing for support.

'Where's yer folks?' queried Langton after a moment's pause.

'Got none.'

'Where's yer home?'

'Got none.'

'Well, where yer staying?'

'Nowhere.'

'Was that why you'—— Langton paused.

The girl nodded.

Langton studied the matter a moment, while the bitter wind tore about them and snapped the thin folds of the girl's frock about his legs.

'Well, come with me. I can do better for you than that,' he said at last, laying his hand gently on her shoulder.

To his surprise, she moved a step away, still clinging to the railing, and struck his hand fiercely from her with all the strength of her small clenched fist.

'Don't you touch me. Leave me alone. You're bad. You're like that Fox woman. All men are bad. I hate you all!'

Her sudden passion exhausted, she dropped her head upon the cold iron rail and began to sob bitterly.

Langton was thoroughly sober now after his sleep in the saloon he had wrecked. He stood staring at her in amazement.

'You've been staying at Mrs Fox's?' he asked at length.

The girl nodded. 'Working for my board; but I sha'n't go back there,' she added. 'She's bad, and she'd make me as bad as herself, and I'd rather'—— She glanced down at the water.

Joe nodded. He knew the lodging-house kept by Mrs Fox.

There was a pause again. The girl rested her face on the iron rail once more, and trembled as an icy gust circled around her.

'See here,' said Joe at length, 'you was about right when you said I was bad. I am a bad lot, and there's a precious sight more like me; but I never was so bad and I never was so drunk that I'd so much as look crossways at a good girl; and if you want to trust me, and come with me, I'll help you, and you needn't be afraid. When did you leave Mrs Fox's?' he added.

'Last night.'

'Where you been since?'

'Nowhere.'

Joe looked at her keenly. 'And you're hungry! I know where you stand; I've been there myself. Well, you come with me and get something to eat. I'll take you to an hotel and get a room for you. To-morrow we'll talk it over and see what we'll do. Will you come?'

The girl raised her head and looked him earnestly in the face. The moon shone out again, lighting up both faces clearly. What Joe saw was a thin, half-starved, childish little face, with great eyes searching him with hope and fear—a face which

aroused in him a feeling he had never experienced before.

The girl saw a face rather bloated by dissipation, with a broad, square jaw, blue eyes somewhat bloodshot, but which looked squarely into hers. There was a look on Langton's face which had never rested there before.

The girl studied for a moment, and then said, 'Yes, I'll go.'

Langton drew her little cold hand through his arm to steady her faltering steps as they walked away, and she made no demur. Straight to a restaurant he took her. The warm air felt grateful as they passed in out of the keen night, but she was too thoroughly exhausted to notice her gorgeous surroundings. It was a typical Western restaurant of the gilded type; the white-and-gold walls set with mirrors, the tessellated floors, the rows of small tables set with silver and glistening with crystal down the centre of the room, and on either side private boxes with hangings of crimson plush screening their openings.

'Bring me some oysters raw, and a hot stew; later, everything you've got hot,' ordered Joe, as a waiter ushered them into a box and drew the curtains. 'A bottle of champagne too, and hurry up,' he added, as the grinning darky disappeared.

And there, after the champagne had given to her chilled frame a new and delicious warmth—there in the soft, subdued light, with the music of a mandoline quartette from the outer room among the palms, and the laughter and snatches of song from a gay theatre-party enjoying a midnight supper rising above the subdued hum of voices and tinkle of glass—Fannie told her pathetic little story: how her parents had died shortly after coming out west, when she was but a baby, and she was placed in an asylum, from which later on she had been engaged by a family to help in taking care of the children. They had moved out to Forest City, where, a short time before, the wife dying, the man had taken his children back east, leaving Fannie to shift for herself. Mrs Fox offered her a place to work for her board, but lately she had tried to force the girl into wrong-doing.

'And I'll die first!' she exclaimed, sinking back in her chair with a look of desperation. 'I'll not go back. I'll jump into the river first,' she sobbed.

Langton was deeply moved, and as he reached his hand across the table to Fannie, said, 'I thought, little girl, we might talk it over in the morning, but it's just as well settled right now. I've no kith or kin that I know of in the world. I was shunted off when a little kid something as you were—sent adrift to shift for myself—and I have been doing so all my life. I know what that means for a boy or man, but I don't like to think of a little weak girl like you being thrown on the world. If you want to go into partnership with me, here's my hand on it; and to-morrow morning my lawyer shall draw up the papers making you my adopted daughter. How old are you?'

'Fifteen,' replied Fannie.

'Well, is it a go?' queried Langton, a rare smile softening his eyes.

Fannie scanned his face earnestly, glanced at the hand which was outstretched before her—a large, broad-fingered hand with pale freckles, showing plainly as it rested on the white-covered table the marks of labour not yet effaced by time. For answer, she placed one little work-roughened hand in his, and as the warm, strong fingers closed about it a feeling of confidence and rest came to the child which she had never known before.

As Langton felt the small, weak fingers clasped in his a throb stirred his heart, and he registered a vow: 'I'll do this one good thing of a lifetime, so that the gold of the "Gunsight" shall not be all a curse, and this poor child shall never have cause to regret this night.'

At the interview with the lawyer next morning it was decided that the best thing to do with Fannie was to place her in a school which he recommended, 'If you persist in the idea of adoption,' he added. 'But don't you think that an adopted daughter would be rather an encumbrance in case you should marry?'

'Marry be hanged!' interrupted Langton. 'I tell you right here, Hardy, I never yet saw the woman I'd marry; or, at least, if I have once or twice, it was a woman who would never think of marrying a man like me. So there you are. Now, I want those papers all made out straight, so that the girl may have everything if I die. I don't want any relations I never heard of coming to gobble my money after I've gone. One thing more. You know I'm apt to be pretty free when I'm having my fling, and there's no telling where I'll stop, so I want to be sure she's all right whatever I do; so you have ten thousand shares of the "Gunsight" made over to her, will you?'

The lawyer gave a low whistle. 'That stock is worth five dollars a share, isn't it?' he asked.

'Yes, and will never be worth a cent less,' replied Langton. 'And now, if you'll give me the address of that school I'll be going;' and, taking the paper Mr Hardy offered, he strode out of the office.

Arrangements had been made to place Fannie in the school, and her room and desk awaited her; but the weeks slid by, and Langton, on the plea that 'her things weren't ready yet,' still kept her with him. He had installed her in rooms in the hotel, and so accustomed had she become to her luxurious surroundings that the past life seemed entirely blotted out. A pleasant state of affairs, but not to last for ever, for Langton was suddenly called up to the mines on business, and Fannie had to be placed in the school before he started.

They were sitting in their cosy parlour this last evening, Langton stretched in an easy-chair before the fire, whose red light illuminated the room and

played over the folds of Fannie's dress—a dress too rich by far for a girl of her age, as a mother would have known. She was nestled on the broad arm of his chair, not minding the big cigar, from which he was puffing clouds of smoke. Evidently she had forgotten or changed her opinion of the badness of men, and her hatred of them, which she had once so vehemently expressed.

'Uncle Joe,' she began, desisting from the operation of patting down his rough hair, which she had reduced to satiny smoothness on the crown, 'I've been thinking of what you said about my name. I think Langton is a nice name, and I'd just as soon take it, if it's truly mine now by your adopting me.'

'Oh, Langton's not so bad,' said Joe cheerfully; 'but your own name Melville is a sight prettier. And then, you see, you might have some relatives—real uncles or something—in the States or the Old Country, and they'd never find you if you changed your name.'

'I don't want them to find me, and I'd rather have your name than my own. Why don't you want me to take it?'

Langton laughed and turned the question; for the real reason—one he did not wish to explain to the girl—was that he knew it had been whispered around that the name of Langton was hers by right, and the adoption only an act of tardy justice on his part—so hard is it for some of us to believe in disinterested generosity; although a few persons believed Joe's story that she was his niece, and, her parents being both dead, he had adopted her.

'And mind you tell them in school that I'm your uncle, and be sure you let them know you're my heiress—not to blow, I mean, but just so that they'll understand you're not a girl they can tread on. That other uncle may be coming some day and taking you away from old Joe.'

The girl looked at him earnestly for a moment, and then flung her arms about his neck. 'I'll never, never leave you, Uncle Joe. If they come, I'll tell them they are nothing to me; and they are not. It's just the same as if I had died there that night on the bridge, and you were my good angel who came and took me to heaven. And there is no one but you and I, Uncle Joe—just you and I;' and she pressed her rosy lips to his.

It was the first time she had ever kissed him; and Joe, with his delicate sense of honour, would never have asked her to do so. He drew her closely to him, as she rubbed her soft cheek up and down against his rough face.

'Just you and I,' she continued to murmur.

After a moment Langton pushed her gently from him, and, getting up, began slowly pacing the room, the child's words, 'just you and I,' ringing in his ears. Langton had had white arms twined about his neck before, and red lips pressed to his, but none had ever stirred his heart as these had. Fannie's loving kiss and gratitude had burned more of the dross from the man's soul in those few moments than perhaps years of preaching could have done. Somehow he felt as he thought he might if he had married one of those whom he had mentioned to lawyer Hardy as so much too good for him; and now, as he could not drag her down, he must raise himself to her level.

'And how the deuce am I going to get there?' queried Langton of himself as he paced back and forth, glancing now and then at Fannie curled up in the big chair, and staring into the fire with wide, unseeing eyes.

(To be continued.)

THE BLACK OFFICER.

By the late ALEX. MACPHERSON, F.S.A.Scot.,
Author of *Church and Social Life in the Highlands in Olden Times*, &c.

OF all the personages living in Highland tradition, ancient or modern, there is no one, surely, who, less deserving it, has had more contumely heaped upon his memory than the long-deceased Captain John Macpherson of the Eighty-second Regiment, known in the vernacular patronymically and from his dark complexion as Iain Dubh MacAlastair, but far more generally as the Black Officer. Perishing as he did by an accident in his seventy-fifth year, while on a hunting expedition in the Forest of Gaick in the central Highlands, during the winter of 1799-1800, the captain's name has since that event—probably owing to the circumstances attending the disaster—been made the theme of the wildest and most improbable fictions, so that now there is no greater bogle in the Highlands than *Othaichear Dubh Bail-a-Chrodhain* (the Black Officer of Ballachroan).

Sir Walter Scott and Hogg the Ettrick Shepherd are amongst the earliest to give highly coloured versions of his life and death. These distorted and imaginative accounts, all apparently derived from superstitious native sources, naturally enough gave great annoyance to Captain Macpherson's family and friends; and the Great Wizard himself, as shown in his *Journal* (vol. ii. p. 150), was in 1828 brought severely to task by Mrs M'Barnet, a daughter of the captain.

The versions of Hogg and Sir Walter Scott, in an abridged form, are given by Mr Andrew Lang in his *Angling Sketches*. In these sketches Mr Lang also gives a still more curious version of the story from the lips of a Highland boatman at Loch Awe. According to the boatman, while the captain was

engaged with a British force in India fighting the French, 'he volunteered to make a tunnel under the walls' to enable our soldiers to enter 'a town they couldn't get into. There was no man alive on our side but the Black Officer, and he had a wall of corpses built up in front of him, and was fighting across it!' The French, it would appear, were on the alert, and, realising the object in view, blew up the tunnel in which, with such gruesome surroundings, the daring officer was the solitary worker. His body was afterwards found 'all black with smoke;' but by some supernatural agency he was miraculously brought to life again. It is added that the party accompanying the Black Officer to Gaick consisted, including himself, of the ominous number of thirteen, 'and they were never seen again, and their bodies not found indeed till this day.' It will come as a surprise to many of his countrymen to learn that the body of the Black Officer, and that of at least one—his namesake, John Macpherson—of the four attendants who perished with him, have, for the last hundred years, peacefully rested with their kindred dust in the old churchyard of St Columba at Kingussie.

By other romancers Captain Macpherson has been accused of living in a house built, of course, in the old baronial style, with the usual and proper adjuncts of gloomy dungeons and underground passages miles in length—requisites that would seem to have been peculiar to Highland farmhouses in the eighteenth century; of serving in the Black Watch as perhaps better suiting his character than the Eighty-second Regiment; of making profitable contracts with a sable gentleman of doubtful reputation; of forcibly enlisting well-proportioned parsons who might possibly fight better than they preached; of taking part in several engagements in the West Indies; of several times meeting suspicious-looking he-goats with horns and eyes; of wearing strange attire—to wit, homespun breeches on his legs, a cap of fur on his head, and shoes made of hide on his feet; of dying because he couldn't help it; and, when dead, of refusing to move unless he were lifted!

Though the original of the following story is given by Dr Dasent in his *Norse Tales*, and a similar tale is told by Rabelais, it would be doing injustice to the researches of one of the Black Officer's accusers to omit quoting the terms of the contract with the Prince of Darkness, which we give in the writer's own words: 'In a contract with the Evil One, who had agreed to give the captain whatever he might desire, the latter, as his first request, wished that the lands of Ballachroan should for their extraordinary fruitfulness be a wonder to all who saw them. To this Clooty agreed, provided he would get the *roots*. That year the captain laid down a grain crop only. He reaped his fields in the usual way, and when Clooty came for his share of the crop the captain coolly told him to take the *roots* according to agreement. Satan complained of this treatment, and insisted that he had been cheated. "Well, then," said the captain, "I'll give you the *crop* next, and I'll take the roots myself." To this Hornie readily agreed, and the following year the captain planted a green crop—potatoes, turnips, &c. At the proper time Satan again appeared and demanded his share. The captain mockingly pointed to the *shaws*. Clooty grinned with rage,' &c. Alas for human credulity and the wiles of the arch-deceiver! Clooty must have grinned in quite another fashion when our adventurous historian, after payment of the customary honorarium, and being thoroughly duped, took his leave of the nether kingdom with a vamped-up version of an old and time-worn story, told there oftentimes by Odin to his friend Nicholas, carefully secured in his singed wallet.

Let us now endeavour to vindicate the memory of this long-dead Highland gentleman, who, if the testimony of his neighbours and contemporaries is to be believed, ought to be revered for his great-hearted kindliness to friends and foes alike, rather than reviled as he was, and is, for attributes that might well make Goethe's Mephistopheles look to his laurels.

Captain John Macpherson, the second son of Alexander Macpherson of Phoness, was born at Glentruim, in Inverness-shire, in 1724. Contrary to popular belief, he was the offspring of mortal parents, and there is no record of any portentous omens heralding his birth or of second-sighted seers predicting his future wickedness. His mother was one of the famous Sliochd Iain Duibh Macdonalds of Lochaber.

Sprung as he was from these houses, it may be said of him, in Highland fashion, that the best blood of Badenoch and Lochaber ran in his veins. Both houses furnished the British army with many distinguished officers; and, inheriting all their military ardour, Iain Dubh MacAlastair, as he was then called, in course of time also obtained a commission. His military exploits have not come down to us, nor have we heard that he saw much service abroad; but be this as it may, certain it is that he attained to the rank of captain, and was employed for several years in his native district on recruiting service. This duty, often a disagreeable, always an unpopular one, Captain Macpherson discharged with so much judgment and success that no less than seventy of his recruits became commissioned officers. No doubt he had the less difficulty in the matter of selection from the fact that 'the genius of the Highland people was ever more inclined to martial enterprise than to the arts of civil life.' But fond mothers always will lament pet sons, albeit otherwise useless, who don the 'red coat,' and the Black Officer—the first recruiting officer they had seen other than the chief—reaped more than the usual measure of opprobrium. He has been accused of atrocities in this respect that are as incredible as they are unvouched.

An example of his heartlessness was given in a

Highland magazine some years ago, to the effect that one Sunday morning the captain found himself walking behind the reverend gentleman who was to preach that day—a typical Highlander of splendid proportions. 'You are too fine a figure,' muttered the captain, 'to be dressed in black clothes. A red coat would set you off to better advantage.' The captain went to church, but every time the preacher turned his massive chest in the Black Officer's direction the determination to enlist him at whatever cost increased. Although the young man was the 'only son of a poor widow,' the Black Officer, notwithstanding her piteous entreaties, never rested until he had attained his object by throwing 'a shilling into the minister's bosom.' The parson was then marched off to Edinburgh, where the Black Watch—a regiment, be it remembered, with which Captain Macpherson never had any connection—was then stationed. Being an intellectual and pleasant young man, the minister soon rose to the rank of lieutenant, and he was enabled—though a soldier—to keep his mother in easy circumstances all her days. The result in the long-run of the alleged forcible enlistment of the well-proportioned parson under pathetic circumstances did not turn out so unfortunate for himself and his mother after all, and rather fails as an illustration of the havoc wrought upon peaceful Highland homes by the ruthless Black Officer.

Eventually retiring from the army, Captain Macpherson betook himself to agricultural pursuits, and so successful were his improvements on the primitive modes of tillage then prevalent that the more unsophisticated of the peasants attributed the surprising results to nothing less than supernatural agency. Spreading sand on an adhesive soil, and so reaping an abundant crop, was looked upon as a feat worthy of Michael Scott himself, so often in their mouths.

More congenial, however, to the captain was the pursuit of the chase, a recreation in which he often indulged, and in which he had no rival. In his old age his passion for it cost him his life; and this brings us down to 1800, the date of the Gaick catastrophe, an epoch in Highland chronology.

The Forest of Gaick lies about a dozen miles south of the river Spey at Kingussie. One of the wildest glens in Scotland, its hills are bare and rugged, and such sheer declivities that in great snowstorms it has not been uncommon for herds of deer to be overwhelmed by avalanches. On the night of a terrific hurricane in the first week of January 1800, Captain Macpherson, who was on a shooting expedition, perished there with the four attendants who had accompanied him. Several other persons were to have gone on the fatal expedition, but various causes had prevented them; and on the morning preceding the disaster the rest had set out for the forest without them, and, intending to stay for some days, had taken up their abode in a stone-built hut which stood immediately under a long, bare slope. The night upon which the event happened was terrifically stormy even for that wild and mountainous district; yet, as the hut was known to be substantially built, their friends felt no anxiety until the third day after the tempest, when, as they did not appear, alarm began to be felt in the strath. Several people set out in search of the party, and upon reaching the glen they discovered that the house had disappeared, a vast volume of snow where it had stood sufficiently explaining what had happened. Next day all the active men in the country proceeded to Gaick, and upon digging into the snow the dead bodies of four of the party were found—Captain Macpherson, lying in bed upon his face; two of the attendants, also in bed; and another in a sitting posture. The body of the fourth attendant was not found until after the snow had disappeared, some distance from the house, having apparently been carried away in the general wreck of the building. The beds of the rest, having been simply heather spread on the floor, were protected by the base line of wall. The stones of the house had been carried a distance of several hundred yards, and part of the thatched roof was found nearly a mile away. The guns of the party were bent, broken, and twisted in every possible way.

The sad disaster gave rise to no end of awed speculation, and now it was that the Black Officer received his fame. Gaick, wild and remote, had an evil reputation of old as demon-haunted, for was it not here that the profligate Walter Comyn, centuries before, was torn limb from limb by two infuriated witches in the shape of eagles; here that a deluded hunter, sheltering in his bothy when mist and darkness encompassed the hills, met a similar fate at the hands of his unearthly paramour; and here, coming down to more recent times, that the more familiar Muireach Mac-Iain first met the famous Witch of Laggan, a single hair of whose head could shear the strongest beam of oaken timber asunder like cheese? Need we wonder, then, that at a place in the people's minds always so associated, the circumstances of Captain Macpherson's death should be ascribed to supernatural causes? The occurrence was discussed at every fireside in Lochaber, Strathdearn, Strathspey, and Badenoch—all sharers in the tragedy—and at each telling gained in horror. 'A judgment!—yea, a judgment!' was now the cry of the bereaved mothers and sweethearts of the captain's least fortunate recruits, in which they were joined by a chorus of superstitious Highlanders. The detention of those who had not accompanied the lost party was ascribed to warning dreams and other omens 'to save them from the wrath to come.' Even at the present day none but a Sassenach, or a rarely-met unimaginative Highlander, would dare to walk alone after nightfall through that awesome, eerie Glen of Gaick.

Having recapitulated the captain's reputed misdeeds, we shall now draw on more reliable sources

for materials to enable us to form a juster estimate of his character.

The celebrated Mrs Grant of Laggan lived only a few miles from Ballachroan, and the respective families were on intimate terms. This lady, a few months after the Gaick catastrophe, writes thus to a friend: 'I will not distress you with particulars of the death of your acquaintance. . . . He took a romantic fancy of going to hunt deer in the desert hills for a Christmas feast which he had projected. He and three or four attendants, sheltering in a hut, were surprised at night by something like a whirlwind or avalanche; in short, they were buried in the ruins of the house. You can have no idea what a gloom has overspread us. *Mr Grant was always partial to him.*' Mr Grant's pronounced partiality for Captain Macpherson would lose half its value without the following delightful glimpse the gifted wife has given of that husband's character. She says of him: 'He kept aloof from a world for which the delicacy of his feelings, the purity of his integrity, and the intuitive discernment with which he saw into character in a manner disqualified him—that is, from enjoying it; for who can enjoy the world deceiving or being deceived?'

Judge, then, if this good parson, this refined and cultured gentleman, living on terms of the greatest intimacy with him for a quarter of a century, could have been partial to Captain Macpherson had he been the wicked person he is in popular tradition said to have been. Another tribute to the memory of the Black Officer is from the pen of his erudite and much-respected clansman, 'Old Biallid,' whose name is ever mentioned with pride by every native of Badenoch. He speaks of the captain from personal knowledge; he was intimately conversant with all details, current opinions, traditions, and actual occurrences in which that much-misrepresented person figured, and this is what he writes of him in 1847: 'The memory of the Captain Dubh is still retained with deep regret and regard. By the few yet living intimates of his friendship he is esteemed as a man who in mental and bodily qualities had few equals; kind, generous, brave, and charitable; full of noble patriotism, and if a formidable opponent, none ever sought his aid or conciliated his enmity without receiving prompt assistance and immediate reconciliation. His purse as well as his talents was ever at the service of the poor and oppressed, and often he suffered considerable losses in supporting the rights of those who were unable to maintain their own. Active, intelligent, and superior in all things, his mind was full of generosity and kindness. In his latter days his liberality in assisting others embarrassed his own affairs; but in every trial his conduct was distinguished by honour and integrity. Amidst his misfortunes he was deprived of his wife, after which he went little into society, but in his old age spent many of his days, like the ancient hunters, alone on the hills of Gaick, with no other companion than his *cuilbheir* and his gray dogs. Such was one of the last true deer-stalkers of the old race of gentlemen.'

The Gaelic bard Malcolm Macintyre gave expression to his poignant grief for the death of Captain Macpherson in an elegy unsurpassed by any in the Gaelic language. Pity it is that so noble an ode has not attracted a competent translator! He speaks of Death as cutting down 'the very flower—the choicest corn-ear—of his clan,' and elsewhere says: 'Strongest pinion in the wing of thy clan, never didst thou set store by the sordid things of earth.' Does not the following stanza, bald and literal though the translation may be, testify to the real character of the much-maligned Black Officer?

> Fosterer and father of the needy!
> Succourer of the hungry and distressed!
> Thy leech, if I could I'd make me;
> I'd find thee the healing-cup of Feinne
> That mighty Fingal brought from Eirinn;
> From death I'd then reclaim thee;
> In Ballachroan gladness should reign then,
> Thy peers drinking thy welcome-cup!

A SONG OF GLADNESS.

> Bliss was in that dawn to be alive;
> But to be young was very Heaven!
> WORDSWORTH.

HARK, for the wind is calling—calling over the sea!
Hark, where the lark is trilling away on the heathery lea!
The skies are sapphire above us, and the sands are gold at our feet.
Better the wind-swept moorland than the dull, dim, crowded street;
Better the grassy hillside, where the browsing oxen stand;
The long, clear, clean-cut furrows, the warm, rich brown of the land.
And beyond lie the spring-clad thickets aglow with their earliest green,
The lance of the purple orchis, and the milkwort starred between,
The buds on the hawthorn breaking, the gorse with its spikes of gold,
The sight of the hazy uplands, the smell of the thyme-swept wold.
There's joy in the breath of the morning when the gossamer's hung with dew,
When the gray sky pales to saffron, the saffron deepens to blue;
And in the flaming midday, when never a cloud is seen,
But the whole broad landscape stretches ablaze with its gold and green;
There's joy in the dusky evening, when the long black shadows fall,
And the glamour of mist and twilight is sweeping over all.
Joy in the light and splendour, the sunshine and the flowers,
In the glory, the glow, and the rapture, the strength and the youth that are ours!

CANADA'S SUNSET CITY.

By JAMES KERR.

'ALL this wonderful province needs,' said Earl Grey, Governor-General of Canada, in a recent address at Vancouver, 'is population, for I understand there is abundant capital ready for investment in British Columbia as soon as there is an available supply of labour. This seems to be the only difficulty which prevents your province from becoming not only one of the most prosperous parts of the British Empire, but also the finest orchard in the world. It is also an ideal dairy-country, and it seems to me that it will be your fault if you are not able, when you have cleared sufficient ground, to export to Japan all the jam, butter, and cheese she may require. No other part of the world should be able to take more profitable advantage of the increasing foreign trade of China and Japan than British Columbia, both from the quality of its climate and its land and from its comparative proximity to Japan. The foreign trade of the Orient would then appear to be a natural asset of British Columbia, always available, like a balance at the bank, whenever you may desire to realise it.'

While the great North-west of Canada has been attracting for years past—and rightly, too—a large proportion of the muscle and manhood of our British population, British Columbia is at the same time calling earnestly for thousands of the sons and daughters of the Old Country, to whom the particular conditions and rigorous climate of the North-west Provinces may not appeal.

The climate here is undoubtedly attractive, sunshine predominating in summer; and, while the rainfall in winter is somewhat heavy, there are no severe frosts or snowstorms, the atmosphere is always mild, the grass green, and flowers can be seen blooming all the year round. Consequently, it naturally follows that in this genial and temperate climate fruit-growing and market-gardening should be conspicuous industries; and although these are yet in their infancy, the results already secured prove beyond doubt their future importance, and the man who is able and willing to take up these branches of labour to-day will assuredly in the near future reap substantial returns. Dairying, cheese-making, grain-growing, hop-culture, root and fodder crops, and all the wonderful possibilities of the fishing and mining industries are here in abundance, and the standard of what has already been done is of the highest.

One naturally asks what is the chief commercial centre—the main business city—of such a richly dowered province? Victoria, on Vancouver Island, is the Government capital, but the financial and commercial capital is Vancouver, the terminal city of the Canadian Pacific Railway. Little over a score of years ago there were only a few houses which went under the name of Granville on the site of what is now the well-known Hastings Sawmill; that little collection of buildings has now blossomed into one of the most important cities in the Dominion, and is increasing in population at the rate of ten thousand per annum.

Possessed of one of the most magnificent land-locked harbours in the world, Vancouver literally stands as the 'Gateway to the Orient.' The Orient is awakening, too, with a suddenness that even the most astute statesmen can hardly comprehend; the East is drawing aside the curtains of centuries, and looking out to new lands. Japan, a country already awakened, is building ships and harbours, and canvassing China, India, and other Oriental countries for purchasers of her goods, and if we are to get our share of the trade we must wake up and advance much farther than we have yet gone.

We already have the Atlantic well looked after, and the important strategic position of Vancouver gives us the key to our share of the Pacific trade. Every part of the globe is already—and must increasingly become—Vancouver's market. Her steamers carry the product of her lumber-mills to Australasia, South America, Great Britain, the continent of Europe, China, and Japan; shingles are sent by rail to eastern Canada, and lumber from the mills of the coast is to be found in every city

 [*All Rights Reserved.*]

of the prairie; salmon is shipped in immense quantities to the British Isles, and halibut to the eastern states. There is a large merchandise trade with the Yukon Territory, as well as with many of the cities of Alberta and Saskatchewan. The Canadian Pacific Railway has a service of steamers running to Chinese and Japanese ports; the Union Steamship Company of New Zealand has a line to Australia, the Alley Line runs to New Zealand, and there is also the Canadian-Mexican service, as well as the Blue Funnel Line from Liverpool and Glasgow *vid* the Orient.

The trade to the Orient has developed enormously, and the awakening in China which has just begun will cause the commerce between Vancouver and Oriental ports to increase beyond all bounds in the next few years. The shipments of wheat which have just started will, it is predicted, grow until the stream flowing west from the golden fields of the prairie will be as large as that which now goes east to Europe. Canadian agents in the Orient are already prompting manufacturers in Canada as to the character of the goods that will be wanted, and all the products of the busy cities of eastern Canada will find their way to Vancouver to be shipped. There will also be branch factories established in the terminal city when the volume of Canada's trade with China and Japan demands them.

The steamers from Australia and New Zealand are now regularly arriving with full cargoes, a large part of which is composed of raw sugar from the Fijis, consigned to the British Columbia Sugar-Refinery Company. The great development of the coasting trade of British Columbia should also be mentioned—to which a decided impetus has been given by the selection of Prince Rupert as the Pacific terminus of the Grand Trunk Pacific Railway and the commencement of the construction of the section of the line from the Rockies to the coast.

Although for a considerable number of years now it has generally been conceded by eastern Canadians that this 'Liverpool of the Pacific' would grow in importance as a shipping centre, it was not until recently that the great possibilities of Vancouver as a manufacturing city were thoroughly grasped. The West has grown so rapidly that no one—whether eastern Canadian or Britisher—realises the potentialities of this section of the Pacific coast until he actually visits it. Then the facts of the situation stand out clearly—namely, Vancouver's ideal situation as an industrial centre, with markets in the north, the Orient, and the British colonies in the Southern Hemisphere. The city is already well served by railways, and every transcontinental line that is projected will build—even when Vancouver is not made the terminal port on the Pacific—branch lines to British Columbia's commercial capital.

The British Columbia Electric Railway has a fine system of cars running through the city and suburbs of Vancouver, and also owns and operates a system between the city and New Westminster, as well as the systems at North Vancouver, Victoria, and other places. The company has also a lighting and power business, and is altogether in a thoroughly prosperous condition, considerable extensions of the tramway system being at present planned.

The number of banks and financial institutions in a city may generally be accepted as indicative of its prosperity or the reverse. Vancouver can successfully stand this test. Rather over a score of years ago it was a small village with nothing so dignified in the way of an architectural structure as a bank building, and now there are twelve of the chartered banks of Canada doing business in the city, and a number of them have several branches within the city limits. Another of the large banks—the Dominion Bank—has just opened an office in Vancouver, and there is on hand at present a project to establish a purely western bank, with head-office here. The aggregate of the bank clearings in the city is going up by leaps and bounds, this year's total being expected almost to double that of last year.

All the leading trust and loan companies of the Dominion have branches established in the city, and there are also a number of important financial corporations that have their headquarters here. The financial standing of the city is excellent, and capital can always be obtained when wanted for its enterprises or legitimate development; and even at the present time, when the stringency of the money-market is keenly felt in other parts of Canada, the financial pulse of British Columbia as a whole is comparatively steady. A Stock Exchange was established in the city in August last, and, as business men of standing and experience are connected with it, it should do much to further the buying and selling of legitimate mining and other stocks, and at the same time serve to discountenance 'wild-cat' schemes, many of which have been issued in recent years under the category of British Columbia ventures.

Twenty years ago Vancouver possessed one little red schoolhouse; to-day, besides its well-equipped public schools, the city has the finest high school in British Columbia, and has also Vancouver College, in affiliation with McGill University, Montreal. The city is also well represented by churches of all denominations.

In concluding this necessarily condensed sketch of 'The Sunset City' of the Dominion, its future cannot be better depicted than in the words of Rudyard Kipling, who recently revisited the Pacific coast: 'This is not the former Vancouver I saw on my previous visit eighteen years ago; and yet, beautiful as it appears to-day, luxuriant and commanding, lying by your still waters and under your placid skies, I can hardly look at it as it is now for beholding your city as it is going to be.' The question of Asiatic labour is assuming some importance at present; but if white labour could only be brought here in sufficient abundance the problem as it exists now would soon be a thing of the past.

A PAWN IN THE GAME.

CHAPTER XXIII.—THE DAUPHIN.

JEAN still clung to his post in the Temple; and one night, a little later than usual, he was summoned to carry the lamp up the stairs for the officials of the Commune. There were some new figures in the group, the chief being Ducreux, who belonged to the inner circle of the Commune. He had the eyes of a fanatic; the ghastly pallor of his face, his restless, twitching eyes, filled Jean with a vague sense of disquiet. Here was a man plainly bent on some cruel errand. The ex-priest Bernard, with eyelids redder than ever, was with him. Simon, an ex-cobbler, with horrible blear lip, malformed hands, and cruel eyes, strutted with an air of unusual importance in the little group.

As the door of the queen's room opened, the two hapless women were sitting at the table mending a boy's dress. The dim light of the candle on the table fell on the sad and downward-bent faces. At the tread of so many feet the queen lifted her head. Jean saw her countenance was drawn and thin; the old look of pride had quite gone.

She made a gesture towards the bed. 'My child sleeps,' she said gently.

'He must wake,' replied Ducreux in accents of authority. 'He is being brought up as an enemy of the people, and the Republic must take charge of him.' And he held out a paper in his hand.

As the astonished queen showed no signs of taking it, he began to read it. It was an order of the Committee of Public Safety directing the son of Louis Capet to be removed from his mother and placed under a good patriot as tutor.

"Here,' said the ex-priest with a grin of cruel humour, 'is the tutor;' and he thrust forward the ex-cobbler, who stood awkwardly twisting his malformed fingers.

The queen listened with a bewildered air, while Ducreux repeated in still louder tones his tidings.

'My son!' said the queen in a wondering voice. 'My son! You cannot take him from me. He is ill. He will die if taken away.'

Then her eyes ran over the evil faces that looked at her with stony indifference. She started up.

'You shall kill me before you take the child away.'

Her movement was so sudden and wild that it struck silence for a moment through the group of commissioners. Presently Ducreux commenced an address to 'the widow Capet' in rebuking accents; but the unheeding queen turned and snatched the wondering child, his eyes still drowsy with sleep, from the bed, and clasped him passionately to her breast. The ring of gloomy faces had no pity. Simon's bleared lips were twisted into a cruel grin.

'What!' said the queen in an undertone, as if to herself; 'give my child to *you!*'

Then she looked round. Against those pitiless wills the distracted woman felt that her passion and grief beat in vain. It was like the wings of an affrighted dove beating against a wall of granite. Ducreux presented his order again and again, at regular intervals, like a pistol, and repeated the phrase 'the decree of the Committee of Public Safety,' as though it were a charm. The ex-priest Bernard broke into jeers. He laughed with evil delight at the scene.

'The tutor of Louis XVII.!' he said, clapping the ex-cobbler on the shoulder. 'The tutor of a prince of the blood!' and he laughed afresh, as though at an exquisite jest.

The queen's eyes ran wildly round the room. They rested for a moment on Jean's face. There might be pity there, but there was no help; and her gaze turned afresh to the harsh and evil countenances of the commissioners.

For two frantic hours this strange conflict betwixt unpitying authority and a broken-hearted woman's grief lasted. The queen at last fell on her knees, with outstretched hands and streaming eyes—the last humiliation of that proud spirit—to beg, and to beg from such a group, her child. Madame Elizabeth and the girl-princess fell beside her.

The ex-priest, beyond even the other figures in the group, seemed to enjoy the evil triumph of the spectacle. He dwelt on it with dreadful relish. The Queen of France and two 'daughters of France' bowed in that sad humiliation!

'Come,' at last said Ducreux abruptly, 'the boy must be given up;' and he caught the child's arm. 'Better have Citizen Simon for a tutor than ride in the tumbrils.'

'Both your children will ride in the tumbrils,' whispered the ex-priest with a grin, 'if you resist. The girl would look well there;' and he turned his red eyes menacingly on the queen's daughter, who shrank back as if she were struck in the face.

Suddenly the queen grew strangely calm. She ceased to weep. Grief seemed frozen in her.

'He must go,' she said to Madame Elizabeth. She began to gather up with trembling fingers the boy's little garments. She brushed his hair, kissed him passionately again and again, and tried to speak. Then, with a shuddering gesture, she released him. The little figure of the boy was led away, Simon's crooked fingers holding his hand, the commissioners with their tricoloured scarfs grouped about him. He gave one backward look; it was a child's look, questioning and terrified, a look of uncomprehending reproach. The queen's eyes dwelt on him with an

expression of broken-hearted and wordless anguish—a figure so pathetically little and lonely set in a ring of mocking and pitiless faces. Then the mother's hands were suddenly extended to him with a gesture of despair.

As Jean closed the door he saw the unhappy queen, an image of speechless grief, turn slowly and look at the little empty bed, still warm from her child's body. So might Rachel have looked when Herod's sword had done its work.

Unhappy queen and mother! Here was grief more bitter than a lost crown or a dead husband.

Simon's quarters were on the floor above the queen's room, and every morning a group of commissioners went up to satisfy themselves that the dauphin was in safe custody. Great armies were threatening France in his name as Louis XVII., and the Revolutionists were not unwilling to revenge themselves for the terror these gathering hosts caused by mocking the unhappy boy who carried that title.

Some of the boy's jailers, however, had not the excuse of aggrieved patriotism for their ill-will towards the child; they were moved by nothing more than the luxury of cruelty. The ex-priest Bernard was always in the group that visited the little captive, and with two or three others he usually stayed for a long time in the room. Some dreadful fascination drew Jean to the door of the room at these times, and he could hear the crying of the little fellow and the loud laughter of the commissioners. They were baiting 'the little Capet,' and they came from the room each morning with a look of satisfied malice on their faces which made Jean clench his fists with honest anger.

The queen at first asked many questions about the boy, but they were never answered. It was as though he had been dropped into some gulf of darkness, or as if the silence of death had shut about him.

Repeatedly when he went on some duty to the queen's room Jean found her sitting in a listening attitude which puzzled him. What sounds from the outer world was she trying to catch? He presently found the key to her strange attitude. The room in which the little prince was confined was above that of the queen. At times the sound of a heavy foot could be heard—that of Simon, the boy's tutor; and the mother was listening to catch—or imagine—a lighter step following it.

The promenade at the summit of the tower was divided in two by a close balustrade. On one side the little prince walked for exercise, on the other the queen and Madame Elizabeth, but always at different hours. One day, however, when Marie Antoinette was walking listlessly to and fro, she caught the sound of feet and voices on the other side of the wooden barrier. It was the little dauphin and his tutor. The queen ran to the barrier and crouched, peering through a crevice through which she could see the group on the other side.

Yes, it was her son—her son, but how tragically changed! The black garments the little fellow had worn, signs of mourning for his dead father, were gone. His dress was ragged; his face was unwashed; he wore a cap of liberty. Simon, with a stick, walked behind him, shouting, 'Sing, little Capet!' and enforcing the admonition now and again with a blow. He was trying to make the unhappy lad sing 'Ça ira;' and the thin, wavering voice at last rose, a thread of tremulous sound, on the air. Then it broke in sobs.

'Sing, thou wolf-cub!' cried Simon with a blow.

Madame Elizabeth ran and stooped over the queen. The blood was trickling down the fence from her hand. She had pressed it into the splintered wood in her anguish till the flesh was pierced and the red, warm blood ran like water.

'You are hurt!' cried Madame Elizabeth.

'Nothing can hurt me now,' said the broken-hearted queen.

Two months afterwards, when taken to the Conciergerie, in passing the low door that led to her cell she struck her too proudly erect head against the lintel, and was asked if she were hurt. She gave the same answer, 'Nothing can hurt me now.' And it seemed as if, with that vision of her unhappy child, the capacity for suffering in her had exhausted itself. Pain has its merciful limits; and when the unhappy queen touched this dreadful height of suffering, some compassionate nepenthe seemed to steal through her brain and drug it into insensibility.

But the unhappy boy still suffered. When some of the commissioners were visiting him one afternoon a pitying curiosity drew Jean up the stairs. The door that led into the room stood half-open, and he saw what was taking place. The little prince stood, a white-faced, terrified child, with dazed eyes, in the middle of the floor. His skin was dirty, his hair uncombed; his feet were naked. His little wrists and knees were swollen.

'Dance, little Capet!' Simon was saying; and, stooping, he struck with his stick the tiny bare feet. 'Dance, you cub-wolf!' he repeated with an oath; and the little feet, under the argument of the threatening stick, lifted themselves tremblingly up in turn, while the group around laughed.

'Nay,' said the ex-priest, 'the descendant of St Louis must go through his devotions.'

He began to recite a blasphemous travesty of the Litany, and to compel the trembling lips of the boy to repeat the dreadful words after him, while the circle around exploded with laughter. The boy seemed to Jean like a little palpitating rabbit in the clutch of dogs. But the ex-priest, with a touch of malice beyond his fellows, wanted to taint the little fellow's mind.

'Sing!' called another of the group; but the boy, with his frightened eyes, was past singing. One of the men pulled a bottle from his pocket and made the boy drink, and drink again. Then the little white face flushed, and, following the thick voice

of Simon, his tutor, he began to falter out the 'Marseillaise.'

Jean stole away with flaming eyes, whispering execrations softly under his breath. The scene kindled him to a passion of rage.

Sometimes Simon went by himself to the room where the boy was confined, and then Jean feared for the lad more even than when all the commissionnaires joined in the sport. One day, as Simon went up to the boy's room, Jean, obeying a resistless impulse of pity and anger, followed him. He listened at the door, and could hear the gruff voice of the ex-cobbler and the whimpering of the boy.

He pushed the door back softly, slipped into the room, and closed it. The boy was crouched in a corner of the room. He had been set to clean the boots of the ex-cobbler's wife, and the helpless hands had failed in the task. The poor lad had fallen by this time, indeed, into a state of semi-idiocy. He was crouched in a corner of the room, Simon standing over him with uplifted stick in hand. He had not heard Jean enter.

Jean turned the key in the lock gently and stole across the room. But the ex-cobbler's ears were quick. He turned, and as his eyes fell on Jean his brow grew black with anger. He lifted his stick with a curse. Before he could strike, Jean leaped on him, caught the uplifted stick, and, tripping the Frenchman up, rolled him with one energetic push on to his face. Wrath was running, a wave of fire, through every drop of blood in his body. He put his foot on the cobbler's neck, grinding his face into the floor, and rained a torrent of blows on the broad expanse of his body. So silent was the approach, so swift the leap, so fierce the hurricane of blows, that Simon lay half-strangled under Jean's foot. Presently Jean stopped and plucked his victim to his feet.

'You brute,' he whispered, with white face and flaming eyes, 'to torment a child! You shall feel what you have made him feel.'

Simon opened his mouth as if to shout.

'Silence, or I will kill you!' and the look on Jean's face was so dark that Simon's voice died away behind his chattering teeth. Jean's eyes, on fire with anger, ran over the face and body of the ex-cobbler. His feet were bare.

'Dance!' he suddenly said. 'Dance, you slave!' and, stooping, he smote the sprawling feet so furiously that, with a whimper, the ex-cobbler lifted one of his stricken feet and then the other. 'Dance!' urged Jean, recalling the scene he had witnessed a few days before.

Presently he stopped. The tempest of anger in him was dying out, and he felt ashamed of his own performance.

'If you torture the boy again,' he said, 'you shall be massacred. Nothing can save you. Do you hear? Every blow you give with the stick shall be repaid with the knife.'

Jean's look was so fierce, his whisper so terrifying, that Simon's teeth began to chatter again. Jean flung him, battered and shaken, into a corner of the room.

'Lie still!' he said, standing over him for a moment with menacing gesture. Then he passed swiftly out of the room, went coolly down the stairs, reached the gate, slipped through without challenge, and disappeared in the network of dark alleys beyond.

(To be continued.)

SOME JACKS THAT BUILT HOUSES.

By ROSALINE MASSON, Author of *Edinburgh Described.*

HEN you enter old Greyfriars Churchyard in Edinburgh, directly to the left you will find a large sculptured monument, crowned by a coat-of-arms, supported by pillars, standing all by itself within railings against the wall, or rather against the backs of the houses of Greyfriars Place, which at this point form the churchyard wall. The little windows of the houses are to right and left of it; probably a washing is hanging out above it; and certainly a gray tabby-cat—old Greyfriars Churchyard simply swarms with cats—lies like a bit of gray sculpture inside the rails on the steps of the imposing tomb. Some of the inscription is in Latin; but the rest reads thus:

'Sacred to the memorie of Robert Mylne of Balfargie, Master Mason to severall Kings of Scotland; and Survieor to this Citie, who, duringe ane active life of honest fame, Builded amonge manie extensive warks Mylne's Court, Mylne's Square, and the Abbie of Halierud house, Leaving by ane Worthie Wife Eight Sonnes and Six Daughters, all placed in the World with Credit to himself, and consecrated this monument, To the Honour of his Ancestrie. Died Dec. 10th, 1710; aged 77.'

Robert Mylne of Balfarg is not the only Mylne commemorated on the tomb. On the pillar occur the names of his son and of his grandson, and below are four suggestive lines:

Reader, John Mylne, who maketh the fourth John,
And, by descent, from father unto son,
Sixth master mason to a royal race
Of seven successive Kings, sleeps in this place.

They were a marvellous family, the Mylnes. They were all, from father to son—once or twice from uncle to nephew also—architects, 'masons,' as they called themselves in those days of plain speaking as well as plain thinking. Moreover, they were Master-Masons to the Kings of Scotland, from James III. all down the Stewart dynasty: James IV.,

James V., Queen Mary, James VI., Charles I., Charles II., James VII., and then, when there were no longer any Kings of Scotland, to the last survivors of the Stewart dynasty—William and Mary and Queen Anne. The first Master-Mason, John Mylne, was appointed in 1482: in 1890 there died a Robert Mylne, architect and engineer. Twelve generations in direct descent—four centuries—all architects. A wonderful record!

James III. of Scotland, of most unhappy memory, was a patron of the arts and crafts. It was not in those days considered proper for the king to be interested in any craft or any art except the art of war, and the anger of the Scottish barons boiled over when James created Cochrane the mason Earl of Mar. However, it is an ill wind that blows nobody good. If somebody is hanged it leaves a vacancy. Cochrane dangled over Lauder Bridge on a summer day in 1482, and Stirling Castle and other royal palaces and strongholds were thereby left unfinished; and so John Mylne was appointed Master-Mason to the Crown that same year: and he was the first of the Jacks who built houses.

The fifteenth century was the age of building, and the masons and wrights of Edinburgh were a very important body, duly incorporated, with the Aisle and Altar of St John the Evangelist in St Giles's Church assigned to them by the Edinburgh Town Council. As far back as the twelfth century we hear of masons, for it was in 1190, in the reign of William the Lion, that a Brotherhood of Masons was founded by Bishop Jocelyn. And right on through the early centuries skilled masons travelled in companies, like troupes of actors. These companies traversed all northern Europe, going from one great building, cathedral or abbey, to another, superintending its completion. In the thirteenth and fourteenth centuries it was the Church that was the patron of architecture; all was inspired by religious fervour. But later on the idea of Monarchy crept in, and national enthusiasm became an active force; and then a body of Masons, presided over by a Royal Master-Mason, was attached to the Court. It was to this post of Royal Master-Mason that John Mylne was appointed by James III., and he held it on into James IV.'s reign, that golden time of Scottish history, when the country was prosperous, and the towns and Court were glorious, and Scotland was held in high honour among the nations, and was ruled over by a king whose 'step was first in peaceful' ha', his sword in battle keen'—James IV., the chivalrous knight-errant and the royal lover and patron of literature and art and of every kind of craft—of building, of shipping, of armament, of printing. And suddenly Flodden stopped everything; and what Flodden stopped above all was the noise of the masons throughout the land. For we know how much building was going on just before Flodden: was not the Palace of Holyrood begun by 'Maister Leonard Logy' about the year 1500?

John Mylne, the first Master-Mason of the name, died before Flodden. He left two sons, Alexander and Robert; the elder, Alexander, is perhaps the most noteworthy of all the Mylnes. He was prominent both in Church and State: an ecclesiastic, a statesman, a lawyer, an author—and of course an architect. He was educated at St Andrews, where he graduated in 1504. He took Holy Orders, became Canon of Aberdeen Cathedral, Prebendary of Monifieth in the Cathedral of Dunkeld, Scribe of the Chapter and Official of the Bishop there, and then Dean of Angus. But the family talent was his, and he was master of the works for building the Bridge of Dunkeld, one arch of which was completed in 1513, the year of Flodden. In 1515 he wrote a Latin history of the Bishops of Dunkeld, which has lately been published by the Bannatyne Club, and the illuminated manuscript of which is now in the Advocates' Library in Edinburgh. This history was dedicated to Gavin Douglas, who was made Bishop of Dunkeld in 1516—and who was the son, by the way, of 'Archie Bell-the-Cat,' whose prompt judgment on Cochrane had prepared the way for the promotion of John Mylne. A year later, in 1517, Alexander Mylne was appointed Abbot of Cambuskenneth and Master-Mason to James V.; but from this day he seems to have been a statesman rather than an architect. It was he that was sent on the embassy to Henry VIII. to negotiate a marriage between young James V. and Mary, daughter of Henry VIII. This marriage James V. fought shy of, preferring to wed little Princess Magdalene of France.

Perhaps the most interesting fact about Alexander Mylne was that when James founded the Court of Session he appointed him its first President. The abbot was in all ways suited for the post, for it was necessary then that a President should be an ecclesiastic, as a large part of the revenues came from the Church; and also, incidentally, because the clergy were the only class thoroughly trained in law. There is a rich stained-glass window in Parliament Hall which has cast its coloured lights on the wigs of successive generations of Edinburgh advocates. It represents James V. seated on the Scottish throne, handing the Papal Bull to Alexander Mylne, Abbot of Cambuskenneth.

With the old ecclesiastic the family of Mylne would have ended; but he had a brother, Robert Mylne, Provost of Dundee, who, when he died a year after his brother, left four sons, Robert, James, Andrew, and Thomas; and Thomas was Master-Mason to Mary Queen of Scots. But in the time of the Reformation men's minds were occupied with other matters than the erection of beautiful buildings, and so Thomas Mylne was unemployed. He was succeeded by his son, another John, who must have been Master-Mason to James VI. and I. before 1584, for he is spoken of in the Somerville *Memoirs* as being in that year the King's 'Mr Meassone' and 'one of the greatest builders

of that age.' He seems to have built a good deal at Dundee, which was his native town and of which his grandfather had been provost, and where no doubt he had 'local influence.' In 1586 he erected the Market Cross of Dundee, and was made burgess and guild brother of the town. Afterwards he went to Perth to build a bridge over the Tay; but this bridge, begun in 1605, was destroyed by flood in 1621. Evidently the shock of that flood also destroyed John Mylne, for he died in 1621—the same year—and was buried at Perth.

His son, another John Mylne, helped his father with that bridge, and married Isobel Wilson, a fair maid of Perth, in the year 1610. Six years later he left Perth and settled in Edinburgh, where the first thing he did was to complete a statue of James VI. and I., to be set in the Nether Bow Port to greet His Majesty when it should please His Majesty to tear himself away from the fleshpots of Egypt—that is, to leave London and revisit, according to his promise, his royal and ancient capital of Scotland.

A little daughter, born in Edinburgh and christened Barbara, was afterwards, we are calmly told, 'from time to time accused of witchcraft.' However, as James VI. had a peculiar frenzy about witches, probably the royal interest made witchcraft an elegant accomplishment among idle ladies. But it may have been because of Mistress Barbara's tendency to get her name into the Canongate and Burgh records that John Mylne migrated again to Perth and to Dundee and to Aberdeen—always building—Drummond Castle, among other places. Ten years later he returned to Edinburgh, this time to serve Charles I. and not the Corporation, and his first task was to make a new water-pond beside Holyrood Palace. Soon after, he was appointed Master-Mason to Charles I., with ten pounds fee monthly 'and livery.' He had two sons who both carried on the family tradition, for the elder, John, was Master-Mason to Charles I. and to Charles II., and the younger, Alexander, was a mason and a sculptor.

The story of this younger brother, Alexander Mylne, was one of tragedy. He must have been singularly gifted, and in the more artistic branch of his profession, for he was an elegant sculptor rather than a solid mason. Both brothers helped their father and worked for King Charles; but it was Alexander who made the richly carved sun-dial (a familiar object now in the gardens of Holyrood Palace), sculptured the King's arms over the entrance door of Parliament House, and carved the two stone statues and the lion over the Royal Arms. His work must have been well thought of, for the sun-dial cost four hundred and eight pounds fifteen shillings and sixpence (Scots); for the King's arms over Parliament House door he was paid two hundred pounds; and for the statues and the carved lion he received two hundred and sixty-six pounds thirteen shillings and fourpence. He married Anna Vegilman when he was about nineteen, and he evidently bore no ill-will to his sister the witch, for he called his little daughter Barbara. It all must have seemed happy and prosperous; but then the plague came. The poor young sculptor, only thirty years of age, fell a victim. He was buried in God's Acre within Holyrood, when it was a private burying-place, before it became the parish burial-ground. But the ghastly part of the story came to light more than two hundred years after, in 1857, when Holyrood was being prepared for the reception of Queen Victoria. The Chief Commissioner of Works was going to destroy the tomb of Alexander Mylne, and William Mylne, F.R.S., his great-great-grandson (also an architect—we are coming to him), protested against the desecration, and Queen Victoria expressed her desire that his feelings should be respected. So the tomb was not destroyed, but was removed and fixed against the north-east buttress of the Abbey Church, a horizontal slab with the family arms and inscription being placed on the original site. In the doing of this the skeleton of Alexander Mylne was exposed, and found to be in remarkably perfect condition; but the skeleton was 'completely twisted, with the face downwards,' betraying the horrible fact that, in all the hurry and fear of the plague-scare, the young sculptor had been prematurely buried. It is a comfort to think that the wife and children and the successful brother had never known of that wrench of agonised awakening. For two hundred and fourteen years the carved sun-dial had met the rain and the sun in the gay pleasure-garden above, and the twisted skeleton of the young sculptor had lain below.

It is John, the elder brother, who is spoken of on the Greyfriars tomb as 'John Mylne, who maketh the fourth John.' He is known as John Mylne of Edinburgh, to distinguish him from his father, who was called John Mylne of Perth. He was born at Perth, for he was the eldest son, and must have been only five years old when brought to Edinburgh; but when he was two-and-twenty he was made burgess of Edinburgh 'by right of descent,' and the same day admitted fellow of craft in the Edinburgh Masonic Lodge. When twenty-five he succeeded his father as Master-Mason (that was fifteen years after his father's death in 1633), and the same year was made Deacon of Masons in Edinburgh and a member of the Edinburgh Town Council. About a year later he was appointed Master-Mason to the town of Edinburgh. All this was in the troublous years of the Civil War, and John Mylne was a loyal servant and adherent of Charles I. His portrait shows him as a Cavalier, with parted hair falling in long curls, a long-bridged nose, a still longer cleft chin, and one taper hand resting on the shoulder of a subdued feminine figure, presumably that of one of his three wives.

In spite of his loyalty, it is recorded that he was present 'on a stage of timber' at Perth on the occasion of the proclamation of Oliver Cromwell

as Protector. He continued as member of the Edinburgh Town Council during the Protectorate; but he evidently got into trouble for his habits of costly building, acquired in the happy days of beauty-loving royalty; 'ane Maisonne callit Johnne Mylne,' it is indignantly recorded, 'being persone of the Commoun Town Counsill, did misleid the rest and did hold the town in continnuale alteration and chaynges to the havy chairges, wrak, and expensis of the inhabitantes.' The old cry — the sacrificing of efficiency to economy!

It is true that John Mylne built much in Edinburgh. He built the old Tron Kirk. He repaired portions of St Giles's—first, most likely, in Charles I.'s time, when much money was spent on it to prepare the church for becoming a Cathedral when Edinburgh became an Episcopal See. Later on he had his hands on the famous crown-steeple of St Giles's, for in 1648 he was paid two thousand seven hundred merks for renovating 'the dangerous and ruinous estait of the stane wark of the Crowne of the great steiple.' In 1642 he visited and reported on Jedburgh; he worked on the pier and fortifications of Leith; and he was appointed master-mason to the unfinished Heriot's Hospital, on the death of a former master-mason to that work.

His wives were almost as numerous, and came in as quick succession, as his works. In 1645 his first wife, Agnes Fraser, died, and he married the following year Janet Primrose—probably one of the family of Primrose to which Lord Rosebery belongs. She died within the year, and the following spring he married a third wife. The Primroses apparently did not resent this haste, for later, at the christening of his only daughter, two of the witnesses were a Sir Archibald Primrose and a James Primrose.

But it was after the Restoration that John Mylne was given the work for which he ought to be best remembered in Edinburgh. Immediately he was restored to his throne, Charles II. thought of his father's intention toward Holyrood, the ancient home of their race. A plan for the magnificent extension and restoration of the palace was drawn up by John Mylne in 1663. This plan is now in the Bodleian Library at Oxford—it ought to be in our Advocates' Library — endorsed 'The Survayes and plat mead by Johnne Myllne His Majestie's Mr Messone.' A small scrap of paper is attached to the plan by sealing-wax, and on it is written: 'This was His Majestie's blessed fatheres intentione in anno 1633.' Better times these under Charles for John Mylne than the grumbling of the Town Council during the Protectorate, when he was so roughly alluded to as 'ane Maisonne callit Johnne Mylne'!

John Mylne seems to have turned his attention to politics, and in 1662 he was elected Member of Parliament for Edinburgh in the Parliament of Scotland, and attended the second and third sessions of Charles II.'s first Parliament in Edinburgh. Five years later he died, on Christmas Eve 1667, a wealthy and important citizen of the city for which he had done so much; and he was buried in old Greyfriars Churchyard.

If Charles I.'s kingly and artistic ideas had been carried out, our Holyrood would indeed have been a worthy royal palace. And it is pathetic that poor Charles I. had chosen as the text to head his 'intentione,' 'He shall build ane house for My name, and I will stablish the throne of his kingdom for ever.' When our present King Edward, who is the great-great-great-great-great-great-great-great-nephew of Charles I. (eight greats), visits Edinburgh, he is obliged to stay at Dalkeith Palace.

John Mylne, however—in spite of his riches, and his three wives, and his royal honours, and his property in the Canongate, and his tomb in Greyfriars—was not the one to build Holyrood or to hand on the family traditions.

Poor young gifted Alexander the sculptor, who had been buried alive at Holyrood, had left a son Robert, who afterwards became Master-Mason—perhaps the most famous of all the line. For this Robert Mylne was Robert Mylne of Balfarg, Master-Mason to Charles II., and the builder of Holyrood. He had been ten years old when his father died, and he was afterwards apprenticed to his uncle John, who had no son of his own, and whom, in 1668, when he was thirty-five, he succeeded as Master-Mason to Charles II. He assisted in the designs from which the foundation-stone of Holyrood was laid by himself on July 15, 1671, and he directed the rebuilding of the palace for eight years, till its completion in 1679; and his name and the date 1671 are cut on a pillar just inside the big courtyard, to the left as you enter. The six original drawings done by him for Charles II. have remained in the Mylne family, and show how the modern Holyrood grew, with the tower to the right of the entrance matching the older tower to the left sacred to the memory of Queen Mary; and the quadrangle behind; and the Doric columns; and the great picture gallery where Prince Charlie gave his ball, and where, since the Union of 1707, the representative Peers of Scotland are elected, and the Commissioner of the Church of Scotland holds his levees.

After Holyrood was complete Robert Mylne was busy all over Scotland, but chiefly in Edinburgh streets and closes. He built Mylne Square in 1689: he assisted in the repairing of Edinburgh Castle, (one of the bastions is called Mylne's Mount after him); he built Mylne's Court in 1690, and many buildings in Edinburgh under the new regulations which prescribed stone instead of timber for building material; and he carved the statue of Heriot over the archway within the court of Heriot's Hospital.

Two years after he had completed Holyrood he acquired the estate of Balfarg, in Fifeshire, from 'David Weems.' The 'ane worthie wife' spoken of on the tombstone was Elizabeth Meikle;

and, as they had eight sons and six daughters, it is little wonder that in 1708 Robert Mylne petitioned for twenty years' arrears of salary due to him as Master-Mason—which means, if we come to think of it, that he had not been paid since James VII. was dethroned, although he had been Royal Master-Mason to William and Mary and to Queen Anne. It is to be hoped his petition was answered promptly, for he died two years later, in 1710; but, anyhow, we have the authority of the tombstone for saying that his eight sons and six daughters were all 'placed in the world with credit to himself.' The eldest of the eight sons, William, was an architect and Master-Mason; he died in 1728. And one of *his* sons, Thomas, was an architect—a Master-Mason; he died in 1763. And two of *his* sons, Robert and William, were both architects—Master-Masons. This Robert, who brings us to the tenth generation of Mylnes, was born in Edinburgh in 1734, and began his studies under his father, and was admitted 'Prentice or honourable member' to the Grand Lodge in January 1754, and made Master-Mason the same year. So far he trod in the footsteps of his forebears, and then he suddenly made a stride for himself. He left Edinburgh in April 1754, went to Rome, studied there for four years, and gained the gold and silver medals for architecture in St Luke's Academy in Rome—never before bestowed on a British subject—and was elected a member of St Luke's Academy and a member of the Academies of Florence and Boulogne. He visited Naples and Sicily and Switzerland and Holland, and reached London, on his way home, in 1759, just when designs for Blackfriars Bridge over the Thames were invited. He, a stranger in London, submitted one; and, out of sixty-nine sent in, it was chosen. The English jealousy of the successful Scot was immediately shown in a thunderstorm of criticism. Articles, and even ballads, scoffing at Mylne's design were circulated, and the great Dr Samuel Johnson took his share, for he growled like a lion, and wrote three letters to the *Daily Gazetteer* full of abuse of Mylne's elliptical arches, and stating that he preferred arches to be semicircular. Nevertheless, Mylne's elliptical arches slowly formed themselves until they gracefully spanned the Thames, and the sole result of Dr Johnson's letters was that they began an acquaintance between him and Robert Mylne which grew into a warm friendship. The much-criticised bridge was afterwards greatly praised and often engraved, and it stood till 1868. Mylne built it at less than his estimate (one hundred and fifty thousand pounds)—an extraordinary achievement for an architect; but, in spite of that, he had to go to law before he could get his pay.

Afterwards Mylne returned to Edinburgh, and built St Cecilia's Hall there on the model of the Opera House at Parma—St Cecilia's Hall, that beautiful oval concert hall where the music-loving élite of Edinburgh society in the eighteenth century—that famous Edinburgh society of the eighteenth century!—gathered to listen and criticise, and where Lord Cockburn reports he saw 'most of our literary and fashionable gentlemen predominating, with their side-curls and frills and ruffles and silver buckles, and our stately matrons stiffened in hoops and gorgeous satin, and our beauties with high-heeled shoes, powdered and pomatumed hair, and lofty and composite head-dresses.' St Cecilia's Hall still stands; you will find it, if you look for it, down in the Cowgate.

Robert Mylne built over the length and breadth of Britain. He built the bridge of Welbeck for the Duke of Portland, the wings of Northumberland House in the Strand, and 'Almacks,' the famous club in St James's, and a house for Dr John Hunter the great Scotch surgeon (who was his brother-in-law; Mrs John Hunter, author of 'My Mother bids me Bind my Hair,' being Mrs Robert Mylne's sister). He built Blaise Castle in Bristol, a manor-house in Herts, a bridge in Glasgow, and he altered Roseneath Castle and Ardincaple House, and produced a hundred other works. In October 1766 he was appointed surveyor of St Paul's, and in 1767 he was made a Fellow of the Royal Society. With his death in 1811 the family's ancient connection with the Edinburgh Masonic Lodge, maintained for five generations, ceased. He was buried in the crypt of St Paul's, near to his hero and predecessor, Christopher Wren. He left two sons, one of whom was a soldier and the other an architect and engineer; and the eldest son of this architect was again an architect and engineer, and died only eighteen years ago, in 1890. A wonderful record, surely! And, curiously, it exactly coincides with the records of the Royal House of Stewart, for each can show twelve generations from father to son of one name and one trade. The Stewarts come down from Robert II., son of Marjorie Bruce and Walter the High Steward of Scotland—right down through the five Jameses, Queen Mary, James VI., the two Charleses, James VII.—down to his children, William and Mary and Queen Anne—one name and one trade—that of Monarchy. And the Mylnes come down from John Mylne, Master-Mason to James III., right down—Dundee, Perth, Edinburgh, London—to Robert Mylne, the grandson of the Robert who succeeded Christopher Wren, and the great-great-great-grandson of the builder of Holyrood—one name and one trade—Jacks that built houses.

THE GOLD OF THE 'GUNSIGHT.'

PART III.

FIVE years have passed since Langton was pacing Fannie's parlour; they had been short years, as happy ones always are. Fannie had left school, and was installed in the beautiful home Langton had built for her, and incidentally for himself. The wan, desperate little girl had bloomed into a beautiful woman, the pride and joy of Langton's heart.

He had just been talking of her to his partner, Philip Rodda, as they rode along the rough trail—the same trail over which he had made his terrible ride to win the 'Gunsight.' In and out the shadows of the pines they cantered slowly on their return from looking at a mining property a few miles from the little town where they had first met. Langton stopped in what he was saying, exclaiming, 'Hurry up. There is the ferry on this side, so we can catch it.' And, putting spurs to their horses, they galloped down to the water's edge.

'River's rising pretty fast?' queried Langton of the ferryman, as they rode on to the boat, sprang from their horses, and proceeded to tie them to the rail.

''Bout two foot a day, and lots of drift coming down,' answered the man as he walked back to cast loose the line, which was fastened to a stump some distance up the bank. The boat swung slowly round to the current as the rope slackened. The man came leisurely down, dragging the loop after him, when the boat suddenly felt the current and began to move out. 'Wait! Hold on!' shouted the ferryman, beginning to run, as some people do although they see it is too late. At the same instant, as the boat reached the full current, a snapping sound was heard, and the heavy steel cable suspended above them fell with a splash into the river.

Fortunately they were so near the broken end that the pulleys and guy-ropes cleared themselves from the broken cable; but the boat began rapidly to drift down-stream.

'Well, here's a go!' exclaimed Langton as he scanned the wide, rushing river, swollen to a yellow flood by the spring rains and melting snows of the mountains. Huge logs and trees, with masses of débris, were shooting rapidly down in the current. 'Not even a paddle!' said Joe, looking around. 'May as well do what we can, though. Here, break off this railing, and we'll see if we can make oars of it.'

Suiting the action to the word, the two men tore off pieces of the light boards, and set to work vigorously with their impromptu paddles.

'No use,' said Joe after a few moments' work; 'a straw would as soon stop a flywheel, an' it'll only use us up. This is getting serious,' he added. 'It's only two miles to the falls, and nothing ever went over them and lived.'

He leaned up against the railing, meditatively biting his moustache, while Rodda gazed over the rushing waters in despair.

'Rodda,' said Langton as the boat continued to move rapidly down the river—turned by an eddy now this way, now that, but always moving down—'Rodda, I've a notion that you'll come out of this all right, but I sha'n't; and I've been thinking perhaps it's as well if I don't. I know I've been making a fool of myself for the last few years. I've seen how you tried to hold me up; but it's no use. I'm breaking Fannie's heart, and I know it. I've tried to brace up, but the drink is too much for me; whisky is too much for me. Perhaps it's the early training. The first thing I remember is the taste of gin, so I guess it's in the blood. I'm not strong enough to fight against it, and I go on disgracing Fannie and all my friends; so I think it's just as well that it ends right here. I ain't afraid. The Lord knows I've tried to be the man Fannie's father ought to be, but it ain't in me. Otherwise, I've always played a fair game and given every man a square deal. And someway I've a fancy the Lord ain't so hard as some of the preachers make out; and if a man ain't a hull hog here, and keeps a little good agoing in him, He'll give him a chance in the next world. I ain't expecting much, but I may just get a chance, and I'll work it up; and whatever good is in me is all owing to Fannie. You tell her so—won't you?—and she'll not feel so bad.'

Rodda reached out and wrung his hand. 'Don't belittle yourself, old boy. I know you for what you are—one of the best-hearted men that ever lived.'

'I believe you think so, lad,' said Langton, a pleased look passing over his face. 'I wish I knew Fannie thought so.'

'She does,' said Rodda. 'We have often spoken of it, and she loves you with her whole heart.'

'Yes, she loves me,' murmured Langton, a tender light shining in his eyes; 'but she'd do that anyway, her heart is so big with gratitude. But it's the being unworthy of her love, and a disgrace as her father—it's that that cuts.'

'If it's the liquor you mean, there's time enough yet,' said Rodda cheerfully. 'Why give up so, old boy? The boat's under us yet, and you have a hundred chances to my one to get out, for I am a poor swimmer.'

Langton shook his head. 'No; I'm right. I feel it,' he said. 'But, as you say, there's no use giving in.'

Rodda grasped his arm and pointed silently over the side of the boat. Langton's face paled as he

saw a huge log bearing directly down upon them, and coming with the speed of a racehorse. Without a word, the two men grasped the side of the boat and awaited the shock.

It came. The heavily built flat boat quivered through every timber and surged through the water at a tangent to its former course, for the log had struck the upper rear corner as they drifted sideways with the current.

'A close shave,' said Langton, leaning against the railing; 'but, see! it has sent us clean through the main current. You are right, my boy; there is a chance yet.'

It was true; the boat had left the current, and was moving more slowly in the water of the eastern shore.

'The water is like ice; but when we reach as near shore as we are likely to get we'll have to take to it,' he added. 'And here comes help.'

A score of horsemen, giving shouts of encouragement, appeared on the bank, one of the riders holding a lariat loosely coiled in his hand, ready to throw if they should draw near enough to make it of any use. The accident to the ferry had been seen at the town, and the riders started to be of help if possible.

The boat swung slowly toward the bank until only about a hundred yards intervened, then began to move out again on the smooth, oily-looking eddy.

Langton began to untie the horses. 'We must start them out,' he said; 'they'll make the shore at this distance, and if you cling to the saddle he'll float you all right.'

Rodda and Langton led the animals down to the end of the boat; but there an unforeseen difficulty arose, for neither coaxing nor blows could drive the brutes off the solid floor. They snorted and drew back, planting their legs firmly as they saw the swift-moving flood into which they were expected to plunge.

'It's no use,' said Langton at length. 'They won't take it, and we're only losing time,' as the boat had drifted farther out. 'Throw off your coat.'

'I never swam a stroke in my life,' said Rodda quietly.

Langton gazed on him for an instant. Then, 'Help me to pull up this plank,' he ordered.

'Go on; save yourself, Langton; never mind me,' said Rodda.

'Help me, I say,' said Langton sharply; and with a mighty effort the two men managed to tear up a plank from the floor of the boat.

'Go on. Don't wait,' urged Rodda again.

'Off with your coat,' commanded Langton, 'and remember what I said. You're coming out of this all right. And one thing more, old boy: be good to Fannie. She loves you. It's no harm to tell you so now; but she can't say so before you speak. And I'd rather know her to be your wife than that of any other man living.'

Rodda's pale face flushed. 'If that is the truth, Joe, you've given me new life, and I'll fight to the last breath now I know life means Fannie.'

They had drifted so far down that the roar of the falls thundered all about them. The two men clasped hands, then Langton shoved off the plank, and in an instant more they plunged into the rushing water.

Langton struck out bravely for shore, and pushed the plank before him. Rodda, clinging to the board, did what he could to help, but the plunge into the ice-cold water had been a greater shock than his frame could bear, and in a few moments he felt his arms growing numb and the plank slipping from his grasp. In an instant more his head sank beneath the water; but Langton had seen, and with a powerful grip caught the young man as he went under, and drew him to the surface. As with a gasp he breathed again he heard Langton's voice saying, 'Don't give up, lad. It's the cramp, but for God's sake don't give up! We're nearing shore, and they're there with the lariat ready to throw.'

With an effort Langton raised himself and his helpless companion higher on the plank. As he did so the lasso came circling out, and the loop settled directly over his shoulders. With a quick jerk, before it could be drawn tight, he drew it off, and placed it about his helpless friend. 'Pull, lads; pull!' he cried.

And pull they did with a will. As they did so, and Rodda's senseless body was drawn slowly through the water to safety, the plank, being caught in another eddy, turned out again toward the current.

'Hold on!' shouted the men; 'we'll take you in a minute.'

Langton heard, and, resting on the plank, paddled bravely toward the shore. But the end of the board touched the current, and in an instant that resistless force drew it out and on with a swift, smooth glide toward the falls.

Those on the bank saw Langton leave the plank for a moment, and strike for shore, then turn again and make for the plank.

'Come on! come on!' they shouted.

'It was the cramp he felt; that was why he did it,' they said later. But Rodda, in after-years—remembering Langton's words: 'Perhaps it was as well to end here'—sometimes wondered if it was the cramp.

Reaching the board again, Langton drew himself up on it till his head and shoulders were out of the water. They saw him raise one arm and wave a farewell; then the board with its living freight disappeared behind a small rocky islet that divided the main stream from the eastern shore.

Leaving some of the party to attend to Rodda, the others put spurs to their horses, and rode to the rocky point beside the falls, and a moment after reaching there they saw the plank tossed high in the air at the bottom.

For hours they waited along the shore to see if Langton's lifeless form might not appear; but the icy waters of the Columbia hide well their dead, and it was not until days after that he was found in that gruesome spot called Dead Man's Basin, where the waters, shut in by a rocky escarpment on one side and straight walls of crumbling sand on the other two, move endlessly round, bearing on their dark bosom the flotsam from the outer current which drifts in.

Above Langton's resting-place a slender white column points to the blue sky, bearing only his name and the inscription: 'Greater love hath no man than this, that he lay down his life for his friend.'

THE END.

PISTOL-MAKING: A LOST SCOTTISH ART.

THERE are, of course, lost arts as well as lost causes, but perhaps none the loss of which can be looked on with more equanimity than that of pistol-making. For over a century and a half this industrial art seems to have flourished in Scotland with great vigour, and, judging from the specimens that remain, appears to have reached a high degree of perfection. It was probably originally brought from France, our ancient ally; but the Scottish artificers appear to have taken so kindly to the work as soon to have rivalled, if not outshone, their Continental competitors. The chief centres of their operations appear to have been Doune, Perth, Stirling, and Dundee; and it is not without significance that these places are all contiguous to the Highlands. No doubt the principal demand would be from the Highland clans, as, in addition to their use as weapons of defence and offence among these turbulent bodies, pistols were also largely used as articles of adornment by the kilted Highlander. The law of supply and demand would, therefore, naturally lead to the armourers having their depôts conveniently situated when the Highland drover brought his cattle to the southern market. Money, too, for this purpose must have been plentiful, for there is evidence that the weapons in many cases bore a high price.

These reflections arise from the perusal of a small brochure now before me, entitled '*Notes sur un Pistolet Écossais, suivis d'une Liste de Noms et Marques de Fabricants Écossais de Pistolets de 1515 à 1835*, par M. Georges Stalin, Beauvais, 1907.' This consists of a paper communicated to a historical society in Beauvais early last year. What the author does not know about pistols is not worth knowing. After a few preliminary remarks on French pistol-making—there were at one time as many as one hundred makers in Beauvais, and examples remain as old as the fourteenth century—and some general remarks on the Scottish variety, of which examples exist in the museum at Dresden dated 1598, he proceeds to describe a very fine example now in his possession. This beautiful arm, of which M. Stalin gives an excellent engraving (obverse and reverse), bears on it evidence not only of its place of origin, but also of its date, its maker's name, and that of the first owner. Its maker was Thomas Caddell, Doune, whose date was 1646, and the arms engraved on one side are those of the Drummonds, Earls of Perth. From a close study of the weapon, M. Stalin has arrived at the conclusion that the first possessor of the pistol was probably James Drummond, sixth Earl and titular Duke of Perth, who followed the fortunes of Prince Charles Edward in 1745, and commanded the left wing of the Prince's army at Culloden, where he was wounded, but, escaping to the coast, set sail for France in *La Bellone*, which was lost at sea with all hands. M. Stalin passes a high eulogium on the work of Thomas Caddell as exhibited on this weapon, which he calls a *chef d'œuvre* of the art, at once an efficient weapon and an object of the finest *vertu*. It cost probably twelve hundred francs.

With laborious research M. Stalin has compiled a list of no less than seventy-eight Scottish armourers, dating from 1585 to 1833, of whose work examples exist either in museums or public or private armouries. Of these fifteen were in Doune, eight in Perth (shades of Hal o' the Wynd!), five in Dundee, and three in Stirling. The remainder were singly in places like Aberdeen, St Andrews, and Edinburgh. It is a curious reflection that the sequestered village of Doune, now quite out of the way of everybody but the ubiquitous motorist, must once have resounded merrily to the sound of hammer and anvil under the hands of Thomas Caddell and his successors. There is little doubt that the legislation regarding the wearing of the tartan and the carrying of firearms which followed the rebellion of 1745 gave the *coup de grâce* to this industry, and sent whatever remained across the border to the congenial neighbourhoods of Sheffield and Birmingham, and the products of the Scottish armourers to museums and the collections of antiquaries. *Sic transit gloria mundi!* J. D.

VILLAGE CRICKET A QUARTER OF A CENTURY AGO.

By CATHOGUE.

IT happened to me during the course of last summer to revisit that particular nook of England where I had spent the happiest days of my boyhood. Twenty-five years ago I knew every face in the village by heart just as well as I knew every corner of the place itself. Happy memories crowded into my mind. In spite of the lapse of years, I could have pointed out the place where I received a black eye or that other spot where I shot my first rocketing pheasant. It was, indeed, the old village that I had known. Every scene in it was familiar and pleasant to the eye. Changes, no doubt, there were, but they seemed to me few and insignificant.

Thus musing, I came upon the cricket-field, and here familiarity gave way to astonishment. I found a ground where the wicket was 'plumb,' where umpires wore white coats and signalled correctly to the scorers, where there was a telegraph with legible numbers, and a capital pavilion. And a professional cricketer was in charge of the whole thing! They still talked of the 'village cricket;' but this was not the village cricket as I knew it—yes, and loved it too—twenty-five years before. The ground was in the same place certainly, but that was the sole thing that remained; everything else was new. But I wondered if the cricket was keener or more amusing.

The ground at X. was on the top of a hill, a mile and a half from the village proper. We used, therefore, to have great difficulty in sparing time for the preparation of the wicket. There was no groundman, as the word is understood nowadays; but two or three of the players would go up the evening before the matches and do what they could in the way of preparing for the next day. This preparation generally consisted of a somewhat sketchy mowing with a scythe, and then a certain amount of rolling with an ancient stone roller which was not strictly round. Water was never provided. Rain or shine, the procedure was identical. And yet, odd as it may seem, the wickets were seldom really bad. The ground was on old down-land, with sound, good turf; and, though it was never fast in the modern sense, it played at a nice easy pace, and a ball that really got up dangerously was quite the exception.

All our matches were half-day, seldom beginning before 2.30 P.M. Shortly before that hour a few members of the home-team would arrive and proceed to erect the pavilion. This was an exceedingly disreputable old bell-tent; but it served to keep the coats, &c., of the fielding side more or less dry during rain, and to shelter the scorer. The crease was marked in very primitive fashion, and was invariably some six inches wide. Occasions are on record when the chain was forgotten and the pitch measured by pacing. 'Plenty near enough,' they would say.

And now for the players. They varied very little from match to match, practically the same side often turning out, with few exceptions. The vicar was captain, a grizzled old gentleman who, although no great performer at the game, yet by his keenness and example did much to win our matches. Moreover, by the exercise of his tactful powers, he often prevented unduly heated arguments between the opposing teams, and soothed the injured feelings of a bowler who considered that he had been unjustly taken off—for our men liked bowling, and there was often considerable jealousy on this point.

It was easy for the opposing teams to fall out with one another. On one occasion an eleven arrived, bringing with them a man from a neighbouring village who was a fairly good bowler but did not belong to their club. It soon became clear that something was amiss. The home-side were seen to be collected in an agitated and murmuring group, and finally one of the oldest members approached the vicar and said that his team would not turn out if the opponents played the 'foreign' bowler. Argument was of no avail. Their minds were absolutely made up on the subject, and the unfortunate foreigner spent the afternoon as a spectator, a small boy being requisitioned as a substitute for him. The joke of the whole thing was that, in spite of taking these somewhat strong measures for the simplification of the attack, the home-side lost the match.

Our side was made up of the various village tradesmen and their sons, of boys home from school during the holiday-time, and almost invariably the butler from a neighbouring house. The trades represented were fairly numerous. There was a baker, there were two blacksmiths, a stonemason, a plumber, a carpenter; and, in fact, as the mason—who was a great local character rejoicing in the name of Daniel, always abbreviated to Dan'l—once remarked, 'Our little lot could build an 'ouse 'tween 'em as well or better'n they can play cricket.'

These excellent fellows did not boast many pairs of white flannels between them; in fact, the plumber, one blacksmith, and the butler were the sole possessors of the orthodox garments—of course, in addition to the boys and the vicar. The remainder of the side always appeared garbed in decent black or something very near it—in short, in their Sunday best.

The blacksmith above referred to, who was known by the name of Guy, somewhat discounted his

otherwise immaculate appearance by invariably wearing a shirt of the same tint as the brownest form of Jaeger, which was innocent of a collar; and although no doubt it was exceedingly healthy in the wearing, it had a most comical effect. This man was our wicket-keeper, and for absolute gallantry in that position he could have had few equals. It should be mentioned that one large cricket-bag contained the whole outfit of the club. These men had no bats of their own, and there were only some two pairs of pads—which were, of course, always greatly in request. But it mattered little to the blacksmith if all the pads were in use: he was prepared to keep wicket with or without such aids to comfort. His voice would be heard saying, 'Where be they gloves?' but never a word about pads. Indeed, some said that he considered their use a sign of weakness, or even cowardly! Be that as it may, he would stop the fastest bowling, standing in the most difficult position a wicket-keeper can select—that is to say, not quite 'up' and not quite 'back'—and occasionally (the assistance of our umpire, of whom more anon, not being always denied him) he would bring off a most brilliant piece of work. He did not take the ball very clean, but allowed hardly any byes, and his absolute indifference to physical pain was marvellous to see. I have known him to receive the fastest ball on the shin or the knee, and occasionally on his chest, without giving any further sign than a bland smile. He seemed to be made of the metal in which he was accustomed to work. On one occasion he made a really brilliant catch, low down on the leg side; the umpire—not ours—gave the batsman not out. Old Guy smiled perhaps a shade more sadly than his wont, and said, 'Dang it, if I 'ouldn't sooner stop six running with my 'ead than 'ave that catch *refused*.' I have no doubt this was true, for he dearly loved getting a wicket.

Of the others, the plumber was a dashing hitter and a fair field; the baker could be relied upon to appeal whenever the ball hit a batsman's leg, but unfortunately for little else, except to drop every catch that came his way. The other blacksmith was quite a good bowler, above medium pace, and a very useful batsman; and the butler, though slow in the field, often made twenty or thirty runs in very fairly good, though somewhat dignified, style. Guy always accompanied the butler to the wicket first, and between them they frequently gave the side a good start, until Guy, owing to his delight in the shortest possible run, was run out. This disaster invariably happened sooner or later.

The vicar was a good judge of the game, though his best days were past, and a master of diplomacy; whilst the boys, who completed the side, often did a great deal towards winning the matches both with bat and ball.

But I am forgetting Dan'l! He was a bowler pure and simple; sad though it may be, more simple than pure. He bowled underhand, at a terrific pace, and was left-handed—a combination that is rarely met with. He had no idea of length. One ball would be a full toss at the batsman's body; the next would take the ground at his own feet. He relied entirely on his pace and extraordinary straightness. Whether his daily work as a mason with plumb-line, &c., gave him the knowledge of direction, or whatever other reason there may have been, the fact remained that he very rarely bowled a ball more than an inch or two off the wicket. His jealousy of our other bowlers was great, and the vicar often had an anxious minute when it was necessary to take him off. He had two marked tricks. One was the habit of expectorating freely before beginning an over, and the other the art of putting on an expression of extreme ferocity as he took his run, or rather walk, of five steps up to the wicket. If he was being severely hit his face would relax into a grim, sardonic leer as each stroke was made, and he always tried to convey the impression that he intended the ball to be hit. On one occasion a public-schoolboy hit three consecutive full pitches off Dan'l for four apiece; the fourth ball bowled him neck and heels. 'There now,' observed Dan'l, 'I bowled 'e they three full-dap to get 'is 'ead up, an' sort o' tempt un, an' *then* I puts one 'andy to the carpet, an' 'e 'ad to go.' One reckless youth ventured to suggest that two, or even one, of the 'tempters' would perhaps have answered the purpose, and proved less expensive to our side. Dan'l looked at him gravely for a second, and remarked, 'I don't 'old wi' nippers playin' in matches.' In his day he was sometimes very successful, and would hit the wicket continually; but he always avoided the display of surprise or elation whatever success, or otherwise, he might meet with. He never smiled unless the batsman hit him, and then merely the smile of superior knowledge. Poor Guy found him very difficult to take at the wicket, as may easily be imagined. Dan'l always batted last, except on one memorable occasion, when his son was playing. He watched the vicar uneasily whilst the latter was writing down the order of going in, and finally said, 'Sur, I'd be glad to go in number ten to-day, if it doan't make no odds, an' let my nipper bat last. *Rats afore mice*, you know, sur.'

Our umpire, who was known as George, was a man of about sixty years of age. He had a fair knowledge of the rules, and generally gave more or less satisfactory decisions. At times, however, either the exceeding closeness of the match, or his sympathy with the individual appealed against, would prove too much for him, and his morals would fail him. He gave guard in broad Gloucestershire, and would say, 'A little nigher to 'e,' or 'You do want to get furder away for middle,' and so on. He was a delightful old man, and paid the closest attention to the game, which is more than can be said of many modern umpires. He always carried five large 'smooth stones,' by which to count the

over, which corresponded to the description of those with which David slew Goliath, except that they were too big for any sling. And he would drop one of these from his right-hand coat-pocket into the left-hand one after each ball. After about two had been so transferred, the remainder would make a clatter that could be heard in the slips.

George once gave a celebrated decision in a case of stumping. Our side was batting, and the son of the owner of the big house (who supplied the butler also) came in. He jumped out at his first ball, missed it, and was palpably stumped. 'How's that?' shrieked the wicket-keeper. George shook his head gloomily, but said nothing. 'What!' said the unhappy stumper; 'not out?' George took no notice. At the end of the over the wicket-keeper went up to the old man and said, 'George, you *know* that young gentleman was out.' George replied 'Well, sur, *'twas as much as ever.*' This cryptic utterance was subsequently translated to mean that 'it was a very near thing,' and consequently George had given the batsman the benefit of the doubt.

There were many tales told of the old fellow's doings as umpire; but, taken all round, he made wonderfully few mistakes, and the visiting side was always glad to see him. He never missed a match for years, until a final and glaring lapse from the paths of fairness caused such a rumpus that he retired from the post. We were playing a desperately keen match—our test-match, in fact—against the neighbouring village of A. We had won the toss and collected 103. A. went in, and the hundred went up for the loss of nine wickets. George, seeing the telegraph show—very faintly, for our numbers were villainous—100, became manifestly uneasy. Dan'l was the bowler, and having expectorated with even more violence than usual owing to the excitement of the moment, he scowled at the batsman as if he were going to cut his throat instead of bowl at him, and proceeded to deliver one of his very fastest, an absolute daisy-cutter from start to finish. Now, as I have already said, Dan'l was generally wonderfully straight; but on this occasion, possibly recollecting that one four would lose us the match, and consequently being a trifle anxious, he bowled a ball that should certainly have been well outside the batsman's legs. The latter, however, jumped in front of it, and it hit him on the outside of the pad, although it would have missed the wicket, as Guy told me privately afterwards, by quite two feet. Even the baker would not have had the face to appeal; but before any one had the chance, 'Hout!' roared George. 'Leg afore wicket!' So saying, he pulled up the stumps and shambled off to the bell-tent. There was terrible trouble, and the vicar gave the old man such a dressing down that he refused to 'stand umpire' again; but for years he came and looked on at the cricket, and supported the club by cheering a good hit or a catch instead of by immoral decisions in times of stress.

. . . . . .

Yes, the old village match was immensely amusing; and although I must admit that the class of cricket has greatly improved, and that what has been done is in the best interests of the best of all games, yet I doubt whether the present players at X. get more enjoyment from their game or are keener than we were in the days when our cricket was so primitive.

TOYS AT THE BRITISH MUSEUM.

By Edith L. Elias.

ome few months ago the authorities of the British Museum decided to collect together their specimens of ancient toys. The work was accordingly done, and now the toys are to be seen grouped together in a large glass case in one of the Egyptian rooms. It is a small but wonderful collection, at once interesting and pathetic. Looking at it, one is most forcibly reminded of the perennial sameness of children's playthings. These battered remnants of the nurseries of long ago may be very different from the gorgeous possessions of the modern child, yet their essence is the same. Here are the self-same jointed dolls, the identical tops, the rattles, the ornamental figures, the countera. To-day we elders play diabolo; yesterday it was ping-pong; to-morrow it may be hop-scotch. But whatever it be, it will be something different. That which pleased but a year or two ago will not please now. The fancy of children is happily not so fickle. The jointed doll, the top, the rattle, have all come down in unbroken succession; but their favour has not grown dimmer because of their long lineage.

Judged by the specimens in the British Museum, the earliest instinct in toys was for dolls. These are not only of the stiff, immovable sort, but there are others that are jointed, and even one made of rags dating back to the second century. There is naturally a wide difference in appearance between modern Parisian beauties and these old, carved bone other-day favourites, but the class is the same. The early dolls are very small and more or less featureless, but they have at least endured; the dynasty of wax and sawdust is of a more ephemeral kind, whilst the dignity of having belonged to the second century puts to blush more passing charms. Many of these toys have been found in the tombs of children; and there is a touch of pathos in the sight of a dismembered doll or

battered rattle, poignantly expressing the taste and age of the child to whom it was once a treasure.

> Golden lads and lassies must,
> Like chimney-sweepers, come to dust.

Next in interest to the dolls is the dolls' furniture. These substantial little tables, chairs, and sofas have still the power to charm a youthful gazer; and who can doubt the wisdom of employing a material so much more durable than wood? Their painted wooden descendants of to-day, with their glued-on legs and rickety backs, may make a braver show at the first, but not at the last.

Next to the little group of what are purely toys are the games. Here boys are better represented. The first collection, with the exception of a top and a good many ornamental figures, is characteristically feminine; the games are as characteristically masculine. In this division are draughtsmen, knuckle-bones, dice. Counters, too—some of crystal, some of bone, and evidently used for games such as our modern ludo—are there; whilst the tesseræ or long rectangular blocks are covered with hieroglyphics standing for—so runs the card—epithets, 'usually of an insulting nature.' Can these have been used in something the same way as our old-fashioned reading sweets? The epithets on these latter, it is true, were as a rule of a flattering, not an insulting, nature; but it is not impossible that between the two may be some subtle link. The boys of the Roman Empire, at any rate, were little different from the boys of modern England. Slang is no recent upstart, but of very ancient family. A curious dice with fourteen sides lies amongst others of the ordinary six-faced square type; but its use is left a matter for speculation.

In the same glass case, but judiciously placed apart from the toys and games, are things for school use. A slate amongst these is startlingly modern. Blackened and stained with years since its youth in the second century, its wax surface has all the appearance of slate. It is made in that now obsolete double shape, in which two slates framed in wood were fastened together by hinges, and, being shut up, formed a sort of book. One half of the Roman slate is gone; but the other, with wooden frame complete, is there, and the hinges remain. Its date is the second century, though the caricatures and rough figures scratched on its surface give it a much more modern appearance. Lying near to the slate are reed-pens, long and narrow in shape, and not dissimilar from our quills; inkpots, too, very much like those in present use, are represented.

A collection of this kind has a twofold interest. Apart from a significance merely curious is one that is purely human. If it is interesting to be able to contrast toys of so ancient a date with those of to-day, how much more interesting is the evidence of the unchangeableness of childish taste! Little fingers were stretched out as eagerly then as now for a rattle; dolls were as tenderly fondled; tops were as vigorously spun. Moreover, that strain of humour which perennially marks the juvenile mind was as strong in the days of Nero as now, and insulting epithets were already a joy—the 'bally fat-head' and the 'beastly rotten' of to-day are only survivals.

A RIVER SONG.

Down among the river mosses,
By the willowed tide,
Stands a giant oak, and tosses
Branches far and wide,
Where the bridge of ivy crosses
And the shadows glide.

Underneath, the water passes
With a gentle flow,
Washing through the slender grasses
And the lilies low;
While the weed in verdant masses
Swayeth to and fro.

Rushy coves and sandy shallows
Tempt the lingering tide,
Where at morn the early swallows
Twitter by the side,
And the fish in deeper hollows
Dart and glance and glide.

Blue forget-me-nots are braiding
In a garland sweet,
Where, in flush of summer wading
With uncovered feet,
Children tend the merry lading
Of a tiny fleet.

Be the future joy or sorrow,
Seek they not to know—
Innocent of thoughts that borrow
Shade of coming woe;
Only meeting every morrow,
Like the river's flow.

River washing through the rushes,
Bring them joy to-day;
Bring a fount of love that gushes
Round their gladsome way;
Bring them mothers' love that hushes
Slumber after play.

THE HEART OF THINGS.

By Henry Leach.

LONDON, *Yesterday.*

SOME grumble to the effect that there is not enough 'magnetism' in the personality of Mr Asquith, not as much as they would like in a man who has risen to his eminence. Able and brilliant he is admitted by all to be; but some of them qualify their admiration by saying that, like the times, he is a little drab, and that he will too seldom stir emotions in the breasts of followers or opponents. But are the magnetic personalities tolerated in these days as they used to be, or indeed are they even possible? In this overcrowded, highly cautious, and very jealous age we do everything to kill individuality and personality, and then when we see them less frequently we complain of the lack of them, and are occasionally inclined to attribute their absence to a certain decadence of the race. You had the 'magnetism' in Palmerston, in Disraeli, and in Gladstone; but would quite that kind of thing be possible again? We sometimes find ourselves scarcely admiring it now. In the general policy of suppressing individuality because there are so many more people now than there used to be who need and demand a little celebrity, we find ourselves giving what is colloquially termed 'too little rope' to our statesmen—too little at all events for the propagation of bold and active genius. Only the other day in these pages we were discussing the times of some former Prime Ministers, and showing how the young man might finish his schooling, and very shortly thereafter solve the great problem as to what was to become of him by achieving the premiership still in his early twenties. No doubt it is an excellent thing that, despite the most abnormal sagacity and genius, we do not make men into Prime Ministers at the present time until they are on the farther side of forty, and we are fully content in a placid disregard of what Disraeli himself said, that almost everything that is great has been done by youth. What we ask for is experience and great sobriety and stolidity. We do not admire it rapturously when we get it, but we think it is quite a safe thing in these tense times of extreme international rivalry and desperation through taxes. In an earlier age Mr Asquith might have won a place in the gallery of the greatest statesmen; as it is he is the natural political concomitant of the age, developed in its highest form. He has great impulses if they were permitted to play freely instead of being half-stifled. We remember that a few years ago, before either Mr Balfour or he had any definite ideas about premiership, the two went down one day to the Earl's Court Exhibition; and Mr Balfour, who had been there before, introduced his friend and rival to the delights of the water-chute, to the end that they both got thoroughly wet by a wave from the artificial lake breaking over the bows of their plunging craft. Both of these eminent statesmen enjoyed this immensely, and then they went off to the switchback railway. Some people of this age will say at once that of course this was very ridiculous on the part of statesmen; but there are others who will put it to their credit for individuality, strength, bewitching irresponsibility, and something approaching to a mark of genius, seeing who they were; the fact being they betrayed, despite their eminence, that they were simple humans, and that is everything in times when Governments and worlds go by machinery. In his early youth Mr Asquith scintillated not less than did the men whose careers have dazzled most when they were young. Indeed, he gave full promise of greatness. When he went to the City of London School he took a leading part in the school debating society, of which Dr Abbott, the headmaster, was president. The Doctor used to correct exercises while the boys debated; but he said himself that he always ceased and listened when young Asquith was up. 'Whenever he entered the lists of orators,' he said, 'I resigned myself to a willing attention, and was content to take my exercises away with me uncorrected.' Even in those days Mr Asquith was a coiner of arresting phrases, which by some is taken to be a hall-mark of genius. Probably no living statesmen has invented

 [*All Rights Reserved.*]

more that have lived than he has done. Some people entertain a curious notion that Lord Rosebery made the phrase about ploughing the sands of the sea-shore, probably by way of complement to his famous 'lonely furrow.' As a matter of fact, the phrase is nothing but a revival, Ovid having the credit of addressing misguided folks who 'vainly plough the shores of the sea with your oxen,' and Mr Asquith was certainly first with the revival. But apart from his *bons mots*, his wit is constantly quick and sparkling. Every day in the newspapers we see the perpetual '(Laughter)' affixed to the quotation of some crude piece of judicial humour; but was ever a neater thing said in the courts than what Mr Asquith said to Mr Justice Wright when the Anti-Gambling League case was being argued there? 'Now, Mr Asquith,' said his lordship, 'suppose I were to give you an area marked by the meridians of the longitude, would that constitute "a place" in your opinion?' Instantly came the answer, 'That, my lord, would be a matter of degree.' Politics apart, one must feel that Mr Asquith is one of the best possible products of the time.

* * *

The Franco-British Exhibition, which comes to be opened in London in the month of May, is, no doubt, to be considered as a perfect consummation of the *entente* between two nations happy in each other's friendship and goodwill, and a pretty touch is to be given to it by the spectacle of King and President going hand-in-hand to the opening ceremony. The Metropolis will be a little more Gallic this coming summer than it has ever been, and the number of French ladies and gentlemen who will be in evidence at the hotels and elsewhere will only be exceeded by the Britishers on the *boulevards* and in the *bois*. The week-end in Paris may soon come to be a popular diversion of the Londoner. Though Presidents wear no crowns, the general British interest in the chief of such a state as France is not less than it is in a foreign king or emperor, as was amply demonstrated when M. Loubet crossed the Channel on a visit to us; and there seems constantly to be such a touch of natural homeliness about these French Presidents as appeals with force to the strong domestic instincts of our people. British folk who had grown up with the curious fancy that in the half-unfriendly France home-life was generally a poor thing, and that there was less marriage and giving in marriage than there ought to be, found a great delight when Loubet came, in contemplation of the stories of his great devotion to his aged mother and of the simple life that he loved most to lead on his country farm. If you set a young person in this country without previous preparation to write a Life of Loubet, this would be the central and quite likely the only point of the story. It must be the same with President Fallières when he comes; and, viewed in this manner, it happens most happily that there is a side to his life which will appeal strongly to the multitude, and which we may expect to hear much talked about when he comes. The grandfather of this M. Fallières who will walk round the exhibition with King Edward was a humble blacksmith, and he was a typical Gascon, living in the village of Mezin. He was thrifty, and, as such hand-workers went, he became well-to-do, and had a praiseworthy desire that his children should live a point higher in the social scale than he did. So he arranged that his son was made clerk to the magistrates at Mezin, though that did not mean quite so much as the office of such a name in this country would do. Then this younger Fallières married the daughter of another magistrate's clerk, and so became associated with a whole family of officials. The young couple lived with the blacksmith, whose home was above his forge, and it was here in 1841 that the present President of the French Republic was born. In due course he was sent to Paris to study for the law; but in those early days there was nothing that was bookish, scarcely anything whatever that was serious, about this young man, and he plunged somewhat recklessly into the gay life of Paris. Such casual thoughts as he gave to other matters than those of pleasure led him somewhat towards agnosticism and the whole way towards Republicanism, and it happened sadly for his parents that the end of this era was that he went back to his village-home a failure at his examinations, an advocate of theories which were detestable to his family, and a very anxious problem for them to consider. It was then, to his credit, that he realised to the full that this was a crisis in his life, very likely the most serious he would ever have to encounter, and he grappled with it. Suddenly there was a complete transformation! All the old, idle ways were given up, and he applied himself with the utmost earnestness to the study of his law-books. Working with feverish anxiety, he passed his examinations and became a lawyer, married, and settled down to a simple and careful life, and speedily rose in his profession until he was regarded as the chief lawyer in a considerable provincial centre. In 1876 he became a deputy; and, rising on the flood-tide of Republicanism, he soon achieved office, and so came at last to the presidency. In the times of his great success he still abides by the simplest life; indeed, the President of the French Republic now, as was the case with his predecessor, sets an example to the industrious classes of his people in his mode of life. His happiest retreat is to his little country farm at Loupillon, in the department of Lot-et-Garonne, where he has a little pasture-land and a vineyard whence comes the wine that is laid on his own table. When he was a youth he was a dandy; now the malicious sometimes say that he has worn the same cravat for eight years. Certainly he has an abiding affection for an old umbrella with a crook handle that has seen many winters' campaigns. He rises at seven, takes a light breakfast, does a little work, and then goes for a walk lasting an hour and a half. Then it is hard toil all day, and he goes to bed at ten o'clock every night. He has a son and

a daughter—the son a lawyer and the daughter a deeply religious lady. There is so much in common between him and M. Loubet, his predecessor, that an account of a conversation when the change of Presidents was made two years ago is interesting. M. Fallières, the first day after his election, rose at seven as usual, and after breakfast and a glance at the newspapers strolled out, dressed in the simplest clothes, with a small hat on his head and his old umbrella under his arm. First of all he walked across to the Palace to see M. Loubet, and for a little while they chatted in the library. 'In four weeks' time from to-day,' said Loubet, 'I will give up the house to you.' 'I am sure it will not want doing up,' responded Fallières. 'Ha!' observed Loubet, with an eye-twinkle, 'the repairs are at the charge of the outgoing tenant.' 'There will be nothing I shall want to replace,' pursued the new President; 'our tastes are the same.' 'What pleasure it will be to me,' went on Loubet, 'to be the first citizen to congratulate you when I retire from office!' And so the talk went on. The necessary strenuousness of presidency was not altogether agreeable to M. Fallières at the outset, even if it is so now. Despite all his displayed energies and achievements, he still likes a slippered ease, and has a *penchant* for putting off until to-morrow what need not necessarily be done to-day. Once when he held a ministerial portfolio four thousand private letters were found unopened in one of his drawers, and he shuddered at the story that Loubet had accustomed himself to reading sixty letters an hour, had established a record of eighty-four, and had signed two hundred and forty in an equal space of time! Certainly we shall be glad to have this M. Fallières in England for a day or two.

* * *

Quite likely it is a grossly unfair exaggeration; but somehow, when the anti-Socialist begins to ponder on the possibilities of the idea which is plainly making such headway, his thoughts often drift on easily into anarchic waters, and then, with the bursting of an imaginary bomb an ugly scene in his mind is blown up, and he gets back to the comparatively pleasant contemplation of Licensing and Education Bills. A party of men sitting round a table in the smoke-room of a celebrated club the other evening moved a little uneasily in their chairs when a man of some authority in affairs gravely said that there were people in very high places in this country who had strongly anarchic tendencies, and were not always afraid of admitting the fact. Listeners began to think of the *camorra* of Naples and of the famous *mafia* in Italy, secret societies numbering almost the highest as well as the lowest and most desperate among their members. An imaginative young man suggested that by anarchism or out of it there might arise in happy Britain a secret society which would have its ramifications everywhere, and which would result in the sure and certain advantage and advancement of the members, each according to his deserts! A pretty idea, indeed, was this for a world of strife and unreward; but such imaginers leave out of consideration that knives and dynamite are not merely accessories to such societies and schemes, but are quite essential adjuncts, without which such organisations would be inept and meaningless. Cultivated to the point of the *mafia*, the secret society is undoubtedly a wonderful and most terrible thing. They say that the secret of the success of Crispi himself was that he also was one of the *mafia*, and that he too, like all the others, had gone through the awful initiation ceremony when blood was drawn from his body, and with it he smeared an image of his favourite saint, which image was then set on fire the while the candidate repeated the words of the oath that he had to take: 'As this saint and the drops of my blood are destroyed, so will I shed all the blood I have for the fraternity.' The candidate draws a revolver, shoots at a crucifix, and is then a *mafiosi*, and he is soon known to all others, despite that his name is not entered on any books but is simply told by word of mouth to district superintendents and by them repeated to the brotherhood. The *mafia* has no books, and its headquarters are constantly changed. We can have no *mafia* in Britain, and we trust that our statesmen may be free of anarchic ways of thought; but it is declared boldly, with the name spoken in conversation, that a popular author is a thorough anarchist though he does not write of it. The fact of the matter is that there are many more of this brotherhood in the country than readers may think, and the number is fast increasing. A year ago there were six thousand eight hundred of them, and now we learn upon a reliable authority that there are over eight thousand. It is understood that there are three thousand eight hundred in London alone. In the various centres the propaganda is carried on by means of weekly lectures and discussions, circulating libraries of standard works on anarchism, and the publication of pamphlets and books. As a body, the British anarchists are believed to have in the front of their policy the ousting of the Socialists from their present position of trade-union leaders, and, to apply the words of a once popular song, to a certain extent no doubt it is true that they are not particular what they do. This may be a light way of treating a serious and gloomy subject; but this eight-thousand-man-power British anarchy is not quite so dreadful as facts and figures might make it appear to be. We have seen anarchists who make the most delightful companions, who would not under the greatest provocation harm a queen-bee or beat a dog called 'Prince.' They are merely anarchists searching for an ideal, and find their search more engrossing than that for other ideals because they have not come to an exact determination as to its character, and so do not know what they are looking for.

* * *

Are these hard and strenuous times—the hurry, the noise, and the motor-cars—resulting in a gradual and certain change in the facial appearance of the

people who live in towns? A few days since the men of an old-established society in London met for their annual assembly, and were photographed together. Afterwards there was produced the photograph of a group of their predecessors who had assembled some thirty or forty years previously, and it occurred to certain curious minds to bring out magnifying-glasses and make close comparisons between the visages of the middle-aged men of the sixties and those of corresponding years engaged in exactly the same walk of life—one that needs much hurrying about the town and through the streets—to-day. And it certainly did seem that the look of care and anxiety was more plainly written on the face of the present-day man. He was shrivelled more, and his nerves seemed on the surface. When you come to think of it, is not the townsman as you see him in the street a very different kind of person from his predecessor of one or two generations back, or of even more recent times than that? Watch the average man walking down the Strand, and you perceive that he has a highly nervous gait; that his head is momentarily turning from side to side, obviously on the lookout for motor-cars; and that his eyes are screwed up until the pupils seem to protrude from out of them to assist his efforts to find a road through the mass for himself and to prevent anybody or anything from bearing down upon him. You may even notice how he commonly holds his hands waist-high as if on guard. All this is only natural, inevitable. It is merely man at the beginning of the petrol age of evolution. Think of the millions of times that London streets have to be crossed daily by Londoners, of the ordeal that each single passage now is, and of the instincts and energies that have to be brought to the acutest activity, and reflect on the impossibility of this not having a permanent effect upon the characteristics of the people, both physical and mental. Environments much less forceful are making their marks on people all over the world. The likeness of the white American to the Indian whom he has supplanted is certainly increasing, and our colonial types in Canada, Australia, and South Africa are quite distinguishable, although they came so recently from the common stock at home. But it might not be pleasant to speculate upon the appearance of the overworked middle-class English townsman a few ages hence, when petrol and electricity will themselves have receded into a past of comparative barbarity, and no insurance company will accept the life of a man who undertakes his journeys by any other means than subterranean roads and passages.

* * *

Is it not something of an anomaly that for once in a way, as a most agreeable diversion, the gentle American should come to lead us back to the archaic simplicity of coaching along our lovely country roads? Of all the roads of Britain there is none that the thin blue haze of exploded petrol more constantly hangs over than the famous Brighton road, which has associated with it a rare wealth of romance. Old tales of the roads are fine things to read of, and everybody from princes downwards has aspired to make records on the Brighton road. In 1784 the Prince of Wales rode from Brighton to London and back in ten hours; that is to say, he was that length of time on the road, taking four and a half hours on the up-journey, and an hour longer to return. A month later his Royal Highness drove from Carlton House to the Brighton Pavilion in four and a half hours with a phaeton drawn by three horses harnessed tandem fashion. And since that time dozens of other records, scores of them, have been made by horse, by rail, on foot, by bicycle; and at last there came a new fever for making records by motor, and the Brighton road became busier, but not more beautiful, than it had ever been. And now we come to a throw-back, and it is an American Vanderbilt that is doing it for us, for in the May of this year the most sporting member of that wealthy house, Mr Alfred, will himself be holding the ribbons and driving along that road perhaps the finest coach with the best horses that have ever been tooled along it. Coach and horses, enormously valuable, have been brought over from America for this special purpose, and it is to be said for this American gentleman that it is the pure love of sport, and the love for the good horse and the desire to see him exercising his best functions in the most appropriate circumstances, that prompt him to these doings.

A PAWN IN THE GAME.

CHAPTER XXIV.—IN LONDON.

JEAN had not intended to interfere when he followed the ex-cobbler to the dauphin's room, still less to interfere in a fashion so dramatic; but anger had leaped up in him full-grown at the sight he witnessed. It ran like a flame along every nerve in his body. It mastered him. It crystallised into avenging purpose as with a breath, and without the consent of his brain. It was clear he could not return to the Temple, and whether he had helped the unhappy lad or harmed him he could not tell. Perhaps he had made his fate worse. But at least he had frightened Simon, and he had certainly thrashed him; and at that delicious recollection Jean smiled softly to himself with a tingling sense of delight.

As a matter of fact, after an experience so terrifying, Simon felt as if some invisible power watched

over the little dauphin. The unhappy lad was no longer tormented, though the neglect into which he fell was almost as cruel as the more active torment of previous days. For nine months he was at the ex-cobbler's mercy—a neglected, unwashed, unpitied drudge. For six months after Simon gave up his charge the boy-prince was practically a forgotten child. He was shut into a room the outer door of which was built up, with only a square hole left, covered by a grating lifted by his jailer two or three times a day to thrust in a little food and water. This heir of all the Bourbons, sitting muttering in the darkness for months, grew blind and semi-idiotic. His room was foul as the den of a wild beast.

Something of the ape and of the tiger survives in human nature, and the cruelty shown to the little dauphin was compounded in about an equal degree of the filthiness of the one and the cruelty of the other.

Jack felt that Paris had now grown too dangerous. He had been many weeks in the city, and had become known to too many people. His reports to London had been valuable, but with the breakdown of the plot for the queen's escape a new situation was created. This was realised by the British Foreign Office, and, to his own relief, he was peremptorily recalled.

'You have done well, Lawrence,' said the Permanent Secretary when, after he had reached London, he reported himself to the Foreign Office. 'But it is clear that nothing more can be done at present, and it would be hardly fair to ask you to risk your life without some clear purpose to be served.'

Jack was welcomed as a hero with loud beating of metaphorical timbrels by his aunt; his uncle received him with a warm grasp of the hand which was more gratifying than even his aunt's admiring exclamations. But, to Jack's astonishment, there was no Denise in Portman Square. Mrs Robert Lawrence explained that she was now teaching French and music and painting to the children of several good families. She had a room of her own in the house of a widow lady in Duke Street, and was shaping her own life.

Jack had heard nothing of M. Duclos's reappearance, of Denise's discovery of the truth about the elder Lawrence's will, and of her resolve to earn her own bread; and when it was all explained to him he stormed furiously at the whole story.

'My future wife,' he cried, 'has no need to earn her own bread!'

'She is not your wife yet,' replied Mrs Lawrence; 'and if you do not show some common-sense and some intelligent sympathy she never will be your wife.'

'Sympathy!' cried Jack with astonishment.

'Yes, sympathy. You must try to see things from her point of view. The poor girl is fighting for her own self-respect. Her mother's history makes her sensitive; and do you wonder at it? Be patient with her.'

'I will be as patient as she wants me to be. Patient!' he went on with rising voice; 'of course. Who would not be patient with the brave girl? But hang that five thousand pounds!'

Jack's first interview with Denise left him furious. She wanted to talk about his experiences in Paris, but he refused to discuss anything except her reasons for leaving the home circle in Portman Square; and Denise, since the subject had to be discussed, spoke with a decision that took her lover's breath away. She had, she declared, the most tender sense of the goodness of Robert Lawrence and his wife, and her eyes filled with grateful tears as she spoke of them; but she was resolutely angry with poor Jack.

'You deceived me,' she said; 'you shamed me by the gift of money. Was it frank not to tell me that it was a gift? You ought to have known I could never take it. I had no legal claim to it. It was charity.'

'It was not charity; it was justice. The money was meant for you by my father. It is yours morally.'

'Yes, but not legally. Would you have done the same with an English girl?'

'Yes, if she had been *you*.'

'How,' asked Denise, ignoring Jack's qualification, 'could a self-respecting girl take five thousand pounds as a gift from one who'—here she hesitated, and the colour stole into her cheeks—'who pretended to love her?'

'Pretended!'

'Well, who claimed to be her lover. It was kind, but,' she went on relentlessly, 'it was clumsy. It was unfair. It put me in a cruel position.'

Jack looked at her with wondering eyes. This was a new Denise, no longer a docile, sweet-natured maiden, with nothing but tenderness on her lips. Here was a woman with chivalry in her ideals and a very human fire in her blood. Just then, too, the fire was scorching Jack badly. There was, he admitted, no ignoble element in it. It gave Denise herself, indeed, a fresh charm. There was a new glow in her cheeks, a keener decision in the curve of her lips, a deeper gravity on her brow. This angel of gentleness, shaken with anger, strangely moved him. Never before had he felt so tingling a desire to take her into his arms. Yet her unrelenting eyes wounded him.

'I did not think,' he said at last sadly, 'you would have been so unfair.'

'I am not unfair,' she replied as she turned away; 'but you have been unfair to me.'

When Jack told the story of his interview to his aunt and uncle that night he was met with only doubtful sympathy.

'She is absurd,' said Robert Lawrence with masculine impatience.

'But what makes her so sensitive,' contended his wife, on fire to defend Denise, 'is the knowledge that there *was* some attempt at fraud with regard to your father's money. The fraud, besides, was in her mother's interests, and you would have been its

victim. She is, at bottom, angry on your behalf. Some of the stain of the business, too, she thinks, clings to her. Do you wonder that she is so sensitive? She wants to keep her hands clean.'

'Yes; but I wonder that she can be so unjust to me,' persisted Jack.

'Well,' said his uncle philosophically, 'justice is not a woman's strong point. She has not the legal mind. She is a first-class partisan, but a very bad judge. A woman has no neutral tints; she knows nothing of suspended judgments.'

'Women,' said his wife indignantly, 'feel more than men, and they see things that men are too blind to see.—I warned you,' she went on to her nephew, 'that you would have to be patient with the poor girl, and you are quarrelling with her already.'

'Quarrelling!' cried Jack in astonished tones.

'Yes, quarrelling. You will have to see things from her point of view. You must win her by sympathy; and if she is worth having she is worth winning.'

'She is worth all the winning in the world, but I thought I had won her. And now to lose her by what was meant to be an act of justice is hard.'

Denise wept passionately after the interview with her lover, and she wept afresh on her aunt's shoulder as she told the story. Jack, on his side, had the capacity for slowly kindled but long-enduring anger characteristic of his race; and Mrs Lawrence grew anxious as she realised into what unhappy relations the two were drifting.

(To be continued.)

BEHIND THE SCENES IN PRINTING-HOUSE SQUARE.

By T. H. S. Escott.

KNUTSFORD in Cheshire no doubt supplied Mrs Gaskell with the original for her Cranford; but about the middle of the nineteenth century other localities in provincial England could have advanced some title to a real identity with the spot in which the scene of the story was laid. Amongst these claimants something might have been said in favour of a Devonshire village that, amid the changes of more than fifty years, still preserves the particular features which quietly impressed a shrewdly humorous literary observer who visited it about the period of the Crimean war. The social traits of Budleigh Salterton that amused and interested A. W. Kinglake may probably be found there still. The prim little coteries of maiden-ladies, rather proud than otherwise of personal circumstances enforcing a close regard to economy in daily expenditure, flourished formerly in the soil of the south-coast watering-place as much as in the pages of *Cranford*. Their successors may be found there still. The latter-day representatives of the race are not less quick than the earlier to resent as ill-bred the intrusion of any appearance of wealth into the little community. At Budleigh Salterton it undoubtedly was that sometime in the last fifties, while the guest of his aunt, then a resident in the village, Kinglake discovered the typical small shareholders in the great newspaper which of late has been going through a whole series of transformation-scenes. Kinglake lived long enough to see the Walters buy up most, if not all, the 'widows and gentlemen' to whom 'deeds and testaments, births, deaths, and marriages,' had given a diminutive interest in the great journalistic estate. Here, quietly living amid the myrtles and violets of the Devonshire shore, were the spinsters who, with some male friends or relatives, were destined to exercise 'a great sway over the conduct of the Crimean war.' They had become, through no act of theirs, members of an ancient firm or company whose business it was to collect and disseminate news; they were wise enough to engage active and gifted men to manage the concern for them in London. How the company got into the way of issuing a paper 'daily containing an account of what was going on in the world, together with letters from men of all sorts and conditions who were seeking to bring their favourite subjects under the eye of the public, also with a few short essays upon the topics of the day,' may, with much more delightful drollery of the same kind, be read in the fourteenth chapter of *The Invasion of the Crimea*.

The great diurnal product of the Printing-House Square, now controlled by strangers, made its mark during the wars following the French Revolution. Its Continental despatches reached it so early as to enable the paper to forestall the Government of the day. In this way and from this time it became the foremost journal of the world and the oracle not only of the English people but of the civilised globe. In his gentle and stately manner complimenting the Devonshire maiden-ladies on the world-wide authority really vested in them, 'your creatures,' Kinglake would say, 'are the great and clever men who preside over the London tribunal before which come appellants from every portion of the planet, from the statesman out of office to the page out of place. When,' he added, 'I was on my *Eöthen* travels the Sultan called himself the asylum of the world. With far more colour of truth,' he would continue to the puzzled spinster, 'that style belongs to your journal.' Gradually it dawned upon the administrators of Printing-House Square that, in addition to the letters from correspondents abroad and at home, the public would welcome some indication

of the lines on which popular opinion was shaping itself. This, it was said, would make the newspaper at once the mirror and the embodiment of national thought. It was, no doubt, merely a chance coincidence; but the Devonian possessors of an infinitesimal interest in the *Times* took a parental pride in the fact of one who had been a South of England resident being chosen to keep the editor in London in close touch with the irresponsible critics of policies and events at the remotest places where English men and women most did congregate. Fraser had at some time held a living not far from Budleigh Salterton. Now unbeneficed, a 'shrewd, idle clergyman,' he was to make it his duty to loiter about in centres of common resort and to find out what people thought on current topics. Obvious and extreme foolishness he was to disregard. Cleverness was also too little representative to be of much importance. His instructions were to wait until he found some common idea repeated in various phrases and localities by numbers of persons who probably knew nothing of each other. So soon as he had lighted upon the same notion pervading the talk of widely different companies or individuals, he stalked down his quarry. The spoils of his chase became what 'stock' is to soup; in other words, it formed the foundation on which leading articles were built. Clever pens were employed to illustrate and enforce by arguments of fact and appeals to common prejudice or common-sense the propositions based upon the substratum of Fraserian facts. Those who read the comments thus produced, if they happened to agree with the writer, were gratified and confirmed in their opinion when they found that opinion stated with such ability. If, on the other hand, they had their place in a different class or had not yet made up their minds on the matter, they were gradually persuaded to take the same side as the newspaper, which, as has been seen, was sure to be the side also of average Englishmen. As long as the mind and the entire being of the nation were interrogated and noted down by this process the newspaper seldom went wrong.

Meanwhile had appeared upon the stage of Printing-House Square the greatest newspaper editor of the nineteenth century. In 1841 there were living in the same house in the St James precinct of London two particularly intimate friends. One of these was the late John Blackwood, the other John Thadeus Delane. Young Delane's father, himself connected with the great newspaper, had a Berkshire country house which made him the neighbour of the chief proprietor, in the Ascot district. 'Congratulate me,' exclaimed Delane, radiantly entering his comrade's room; 'I am the new editor of the *Times*.' 'On that,' as Mr Blackwood used to tell the story, 'we danced, in our delight, a saraband.' The man who thus filled the chair left vacant by the death of the famous Barnes was in no sense learned; he could scarcely be called, apart from his associations, a literary man. He was, however, already even in his youth, and became increasingly afterwards, a shrewd, genial, open-minded man of the world, naturally honest, impartial, and fair, with a matchless knowledge of human nature and an insight nearly infallible into political motives at work on the Continent as well as in England. One of the most famous men on the *Times* under Barnes had been Edward Sterling. His were the slashing articles which won for the paper the name of 'Thunderer,' but which, compared with the leaders introduced by Delane, were very poor stuff indeed. The veteran publicist and diarist Crabb Robinson had worked for Barnes; he devoutly congratulated Walter on the better literary tone at once secured by Delane. The most historic among the earlier achievements of the editor of 1841 was not, however, literary or political; but the paper's services to finance and commerce impressed the business classes throughout the world. A gang of knaves, led by a certain Bogle, had concerted a scheme for a gigantic swindle which, if successful, would have defrauded every bank in Europe. Within a few months of Delane's having entered on the editorship every branch of the paper's business department had been put into the highest efficiency. Sure of his facts down to the smallest detail, the editor in his correspondence and leading columns had laid bare all the ramifications of the vast and complicated fraud. The incriminated persons brought a libel action against the newspaper; the jury returned a verdict of a farthing damages. The Judges refused costs. Not only at the Mansion House but upon every Stock Exchange in the world subscriptions were started to indemnify the costs incurred by the *Times* in this business. The proprietors rejected the money-gifts for themselves, but founded with it a *Times* scholarship at Christ's Hospital, the school of its first editor of fame, Thomas Barnes. An incidental consequence of this episode was that thereafter, abroad and at home, the *Times* became known as 'the organ of the City.'

Another decade, or a little more, passed; the *Times* had now become the force in international affairs that caused the Crimean historian Kinglake to pen the lively and entertaining account of the paper's inner life already glanced at. The first of war-correspondents was assuredly that disciple of Socrates, Xenophon, who wrote 'The Retreat of the Ten Thousand;' till 1851–54 he was without any English successor. Then the *Times* sent forth W. H. Russell, the famous prototype of all latter-day 'specials' to the seat of war in the Tauric Chersonese. In its general outlines and results the work done by this Napier of newspaper writers is too familiar to need recapitulation now. Out of his labours grew not only the mission of Florence Nightingale, the founder of modern nursing, but the *Times* fund for the relief of all sufferers in body or estate from the war at home as well as abroad. The vivid military narratives of the *Times* stirred as with a bugle-note the collective heart of the nation, as

Captain Marryat's and Charles Lever's novels made many boys sailors and soldiers. Conned in playground or schoolroom, the despatches from the seat of war published in Blackfriars sent up the applications for direct commissions by thousands daily. Especially did the *Times'* accounts of the hard, close, hand-to-hand fighting at Inkermann swell the list of the recruits. Recalling this period, his voice tremulous with emotion and a tear glistening in his eye, Kinglake said to the present writer, 'Forward came these brave boys, each life in hand, in more ample number than when fortune's smile was all sunshine.'

Some words may be given to the methods as well as personality of the great editors who for more than a generation not only ruled the *Times* but were themselves the *Times*, in the sense in which a great political leader like Disraeli or Gladstone is the party which he commands. Delane had no special gift of personal magnetism; his genius for editorship showed itself in giving his writers the work each was suited to do, and so getting their very best out of them. Every day at 10 A.M. he began his duties, generally at his office, sometimes at his 'dingy, shabby little house,' to quote his own words to me, in Serjeant's Inn hard by. With a few short breaks, he continued at work till 4 A.M. on the day following. In this way breakfast and lunch often were united in a single meal; afterwards came a ride in the Park and business interviews. The next day's paper had to a great extent been arranged for before the editor had left Printing-House Square in the small hours. The best notion of Delane as an editor would be gained from a collection of his six-line notes to his writers, suggesting subjects and a line of treatment. These letters, when he could see clearly at the time his way so far ahead, might be written after the paper had gone to press, before he got back to his abode in Serjeant's Inn; in that case they were posted. More frequently the instructions were delivered at the residence of the selected writer by hansom-cab in the forenoon.

Of the men who received these communications something may now be said. Though the *Times* had not become really a national force before the Delanian epoch, there were famous writers for it under Delane's predecessors, and its conductors were among the intimates of great men in Church, State, and Society. In 1811 S. T. Coleridge left the *Courier* in consequence of some unpleasantness arising out of an article he had written on the Duke of York. The poet-philosopher's friends wished to secure him a place on the *Times;* its then editor, Dr Stoddart, replied that Fraser's infinite powers of productiveness left no room then for a new-comer. This Fraser was the divine originally deputed to collect evidences of popular feeling in the manner described above; he had been lately promoted to the position of article-writer. Of Barnes, who followed Stoddart, and whose assistant J. T. Delane himself began by being, countless anecdotes—the most familiar being, perhaps, the most apocryphal—are told. So far as could be done in those days, he organised for the first time the reporting department of the newspaper. In doing this he occasionally had reason to give his employés a bad quarter of an hour. Barnes had wished to have a leading article written on a certain charitable society whose report was to be read at the anniversary dinner. A stenographer sent to report the proceedings returned to the office very late at night. 'Let me,' impatiently exclaimed the editor, 'have the facts and figures at once.' 'I am very sorry, sir,' stammered out the unhappy man, 'but I have been able to bring back nothing. The fact is, the whole company became so drunk that no business could be done.' 'Surely,' rejoined Barnes, 'the secretary gave you some details?' 'Alas, sir!' was the reply, 'the secretary was quite the most tipsy of the lot.' The other member of his staff of whom the editor fell particularly foul was a parliamentary reporter who had 'taken down' one of Daniel O'Connell's most impassioned speeches; it contained a famous peroration in which occurred the expression, 'Then the Genius of Ireland uplifted her bloody hand.' The speech, as copied out and published next day, printed the epithet as if it had been a profane word. The connection with the *Times* of both these editorial subordinates came to an abrupt end. The greatest as well as the last passage of arms between the newspaper and a public man of the first eminence took place also under the Barnes régime, in 1830–31. Commenting on the absence of the Duchess of York from the coronation of William IV., the *Times* with spiteful minuteness attributed it to pure pique. Lord Brougham sent his secretary to Barnes with a peremptory demand that he would at once disclose the authorship of the article. The editor point-blank refused; on the secretary's remarking that his chief would probably call himself on the subject, Barnes sent back a message to the effect that such an invasion would, if necessary, be repelled with force.

The great feature in the newspaper's management during its prime under Delane was the mystery that shrouded all the details of its daily production. To quote a phrase then current in Fleet Street and Pall Mall, the editor 'kept his beasts in different cages.' In other words, when late leaders had to be written on the premises the different contributors did their work each in his own room, rarely seeing and never recognising one another in Printing-House Square. When an article attracted special attention, speculation may have been busy out of doors as to the pen from which it came. From the *Times* men themselves never did a word of suggestion, still less of revelation, leak out. This dispensation of judicious reserve immensely enhanced the importance and the effect of what was published; it continued to be the rule of the place under all those successors who had been personally trained by Delane. That the secrets of Printing-House

Square should have been kept with absolute inviolability during so many years is the more surprising because its literary controllers mingled unreservedly with every section of contemporary social life. Of course there never existed much doubt as to the connection of a few prominent public personages with the newspaper. Such was the Permanent Under-Secretary of State for the Colonies, the intimate and confidant of Newman and Pusey, Frederick Rogers, the Oxford Anglican who died Lord Blackford. To him may be added a man still better known in his day, Robert Lowe, Lord Sherbrooke, who in private life never seemed to show to such advantage as at Delane's little dinner-parties in Serjeant's Inn; the other most notable guest on the occasion now recalled being Gallenga, the Italian refugee, who was indebted for his first introduction at Printing-House Square to Bulwer Lytton himself. Charles Dickens and Anthony Trollope were the two other novelists of the time who represented literature at Delane's dinners. There was a special propriety in each of these being a guest. It was a correspondence in the *Times* about an absentee clergyman that suggested to Trollope the earliest of his fictions, *The Warden*, which first made him famous. In 1838 the *Times* had published some paragraphs about the cheap Yorkshire schools; one especially, near Barnard Castle, was mentioned. In those newspaper passages Dickens first saw the germs of *Nicholas Nickleby;* the particular establishment to which attention was specially drawn appeared in the book as 'Dotheboys' Hall.' Twelve years later Robert Lowe was enrolled as one of Delane's men. His earliest articles were on the subject of Chancery reform. By none were these leaders pondered more carefully than by Dickens. The articles were yet appearing in the *Times* when Dickens issued the numbers of *Bleak House* dealing with the case of 'Jarndyce *v.* Jarndyce.' Yet another popular novelist found inspiration from the *Times*. Robert Lowe by his writings in the newspaper sought to direct English fortune-seekers from the overcrowded goldfields of California to the more profitable and comparatively unworked treasure-centres of Australia. Lowe also it was who in the *Times* drew the picture of the evil effect of the convict element in the colonies which suggested to Charles Reade his attack upon the transportation system in *It's Never too Late to Mend*.

It was not merely by its editorials that, during the years now looked back on, the *Times* maintained in perpetual freshness its sympathy with all the interests of the day, political, social, material, and intellectual. It was then habitually supplied with occasional articles from writers who combined an expert's intimacy regarding some particular aspects of questions 'in the air' with a capacity of popular treatment. This knowledge was seldom clothed with the leader form, but appeared in the headed article or in the leaded or even double-leaded letters. With a delicate humour for which, among his contemporaries, he stood alone, Kinglake, on the occasion already referred to, would compare the English habit of recourse to the correspondence columns of the *Times* on all difficult or pressing subjects with the periodic consultations at critical conjunctures by the old Greeks of the Delphic oracle. Long before it dreamed of connecting itself with the literature of the day, the *Times* constituted a sort of finishing school for readers in all parts of the world. One instance of this within the experience of the present writer may be mentioned. Some years ago, when staying in the north of Italy, I accidentally encountered, and afterwards visited at his house near Pallanza, an English gentleman who had settled on Maggiore. It would have been impossible to find a host more extensively or accurately informed on the science, letters, and politics of the time or of the 'day before yesterday.' Some words of surprised compliment from me drew from him this reply, 'The secret of it lies on that table;' and he pointed to an enormous pile of the *Times*. 'Since I left the university I have read very few books of any kind. I receive the *Times* every morning. I go through it thoroughly, from the opening advertisement to the printer's name on the last page—getting it up, in fact, as one might get up one's books before going into the schools, and I never find it so useful or readable as when, at this moment' (for the month happened to be September), 'the Long Vacation opens its columns to miscellaneous articles.' Delane was beyond doubt the modern founder of journalism. Nor did he only place his paper at the head of the daily press. He made it, in respect of variety of contents, early and first-hand authenticity of intelligence, a pattern, on their degree of practical fidelity to which has depended the capacity of other newspaper editors to convert their journals from speculations into properties. The success of Printing-House Square must ever, one would think, inextricably associate itself with loyalty to unique and national traditions.

A regular biography of Delane has never been published. It never will be. But the narrative now given may supplement the *Life and Letters of John Thadeus Delane* (1817–79), arranged by his nephew, Mr Arthur Irwin Dasent, and published by John Murray.

AN ADVENTURE WITH 'GRAY NURSES.'

By Louis Becke.

THE man who thinks that he knows everything is very widely dispersed. One such I knew in Samoa. He was a rich young Englishman who came to the South Seas to buy land for cotton-growing. He so irritated the natives by his gross disregard of their manners and customs that he not only got himself badly mauled about, but involved a number of the white residents in serious trouble as well. He was continually making blunders, some of them of a highly diverting character, and yet nothing could convince him that he had done anything wrong or absurd. He was enwrapped, not in a mantle, but in a sheet of chilled-steel self-conceit and arrogance. But one day, through an act of unparalleled folly, he received such injuries that for some time there were but faint hopes of his surviving them. Briefly, it was this: he pestered me into lending him my whaleboat and crew to board a trading-vessel hove-to outside the reef in bad weather. Knowing him to be inexperienced, I at first flatly refused; then he blustered and cajoled in turn, and finally I told him to take the boat and 'go hang.' My crew of natives managed to get the boat safely alongside the vessel, though the 'man who knew everything' twice let her broach-to through his inability to handle the long steer-oar, although he had the physique of a working bullock. Then, in coming back, he stormed and bullied them into letting him discard the steer-oar and ship the rudder. And then, under her lug-sail, the boat spun over the seas for the reef, on which a very heavy and dangerous surf was breaking. Result: the boat (worth fifty pounds) capsized and was smashed, and so was 'the man who knew everything.' He was very repentant after this, and ended up by becoming a general favourite in Samoa, for at heart he was a good fellow.

But for crass pig-headedness and self-conceit I never met a man whose exploits in idiocy could rival those of the subject of this story; and the particular incident which I relate, though I can now recall it with amusement, at the time quite unnerved me and filled me with terror, for I was only a boy of twelve years of age.

Between the mouth of the Hastings River (New South Wales) and the little port of Camden Haven there are several conical-shaped hills, or rather miniature mountains, which start sheer upward from the sea, and are connected with the mainland by narrow necks of dense scrub-covered land. Two of these hills are locally known as Big Nobby and Little Nobby, and in fine weather my brothers and I frequently went there to catch that most beautiful of all Australian sea-fish, the schnapper. The sea-face of Big Nobby was noted for a great cave which penetrated some hundreds of feet into the interior of the hill. Access to it could be gained by a boat, which in fine weather could be taken between two walls of rock which extended some distance seaward; and on exceptionally fine days, when the tide was low and no sea was running, we boys had several times swum into the cave, lit a fire with the driftwood we found wedged in among the crevices, and imagined ourselves pirates or smugglers. But we never attempted this without leaving one of our number behind on the northern side to look out for sharks, for in the summer months the coast was infested by the most ferocious of all—the dreaded 'gray nurse.' In fishing from the wall of rock either for schnapper or the monstrous brown groper we took every precaution against slipping or being dragged over by a powerful fish; for whenever the bright-hued schnapper were plentiful in the narrow passage the sharks were sure to follow, and one required to be very quick indeed in hauling up a fighting schnapper of ten or fifteen pounds to prevent it from being seized either by a 'gray nurse' or its equally active companion in sin, a 'blue pointer.' To be dragged over meant death, for the sides of the rock overhung the water, and to climb up even on a calm day was a matter of time and difficulty. Sometimes, without wishing it, we would hook a groper, and then there was nothing to be done but to cut the line or make it fast and let the fish break it, for it would have been impossible for our united strength to have hauled up a monster of perhaps over three hundred pounds. Occasionally, when we got fast to a groper, and had made the line secure to a knob of rock, a shark, or several, would come along and relieve us of all trouble by biting the huge fish in halves, or carrying it off bodily, with part of the line as well.

The place was seldom visited by any one but ourselves and a few wandering blacks. The people of the town—Port Macquarie—believed it to be haunted by the ghost of a poor convict who in 1841 escaped from his guards, secreted himself in the cave, and perished miserably of starvation; for bad weather came on, and he was unable to leave his retreat. I well remember how, years afterwards, his skeleton was one day found, and the mouldy bones brought into the little township for burial.

My brothers and I used to call the spot 'The Death Hole,' and it now well deserves the name, for a terrible tragedy occurred there in 1886, on New Year's Day. The annual school-treat was given at a little sandy beach near by, and one of the school-teachers foolishly attempted to swim into the cave in the presence of some scores of his pupils and his own wife and children. The back-wash carried him out, and a fellow-teacher jumped

in to his rescue. Both were drowned, and their bodies were never recovered.

Now to my story.

A few hundred yards from the peninsula that connected Big Nobby with the mainland a landslip had occurred, which had revealed the presence of a supposedly valuable copper-lode. It was on the face of a lofty, well-wooded spur which terminated almost at the water's edge. My father and a gentleman named Rudder decided to work the lode. A party of miners came from Sydney, and operations were begun by driving into the face of the spur, and the drive had been timbered for about one hundred feet, when operations were suspended on account of the Christmas holidays, the Cornish miners emphatically insisting on their right to have a 'spree.'

The manager of the mine was a big Prussian named Zaabe. He was no doubt a good manager, and knew all about copper and copper-mining, but in other respects he was not a success. The rough Cornish miners detested him for his haughty, domineering manner; but in a way they respected him, for he was always ready to fight, although he had no more idea of how to use his hands than has a cow of playing the flute. Consequently he was generally knocked out in the first round, and I really believe that the 'Cousin Jacks' purposely gave him impudence so as to make him assault one of their number for the mere pleasure of 'layin' un out.' He had never before been placed in charge of British miners, and soon found out that the hot-tempered Cornishmen were a very different class of beings from those he had formerly 'bossed' in his native Prussia. Another reason why he was disliked by the local people was for his brutal treatment of horses and animals generally. He was a heavy man, and never showed the horse he rode any mercy. A poor rider, he would start off at a gallop, and always brought his mount back to the camp in a state of exhaustion; and when I add that he had a most irritating and bullying manner of speaking even in ordinary conversation, the reader will readily conceive that he was the wrong sort of man to come to Australia and be placed in a position of authority over men who were not used to dictation even from their employers.

The miners, of whom there were fourteen, had made their camp of four tents on the beach just above high-water mark. My brothers and I were great favourites with them, for we would sometimes, after a day's fishing, spend the night at the mine, and we not only gave the miners all the fish they wanted, but used to provide them with game as well, and every Saturday some of them would come fishing or shooting with us. I shall always remember how, one day when three of the Cornishmen and one of my brothers hooked and almost landed with a bowline a groper of over three hundred pounds on the rocks above the 'Death Hole,' a 'blue pointer' shark leapt at the struggling fish, seized it across the back, and hung on. The weight of the shark added to that of the groper was too much, so the three "Cousin Jacks" and my brother all tumbled in together off the slippery rocks, and away went the shark with the groper, the bowline, and a hand-made fishing-line and hook worth over two pounds. None of the Cornishmen could swim, and it was a marvel that they were not all drowned.

Before daylight on the day before Christmas my brother and I were sent by my father—who was the resident police magistrate for the district—to the copper-mine to see if any of the miners were at the camp. Two days previously the whole fourteen had come into town and proceeded to enjoy themselves at the low public-houses by assaulting the mounted police or any one else who tried to restrain them. Eight of them, with the assistance of the townspeople, had been locked up, two others had been shut up in the priest's stable to sleep off the effects of the poison they had swallowed, and the other four were missing; and so, fearing that they might have met with a serious accident on the dangerous track to the copper-mine, my father was anxious about them.

On arriving at the mine we discovered the four men in one of the tents—all in a semi-stupefied condition and almost unable to rise. We made them some tea, and hid away several bottles of rum we found in one of the bunks, and were putting the tent in order when Mr Zaabe appeared. He swore freely at the men in German for some minutes, and then sat down and had some tea and damper with us—it was not yet seven o'clock. He asked us how we were going to spend the day, and we told him that we intended to wait for low-tide to catch some crayfish, then fish for schnapper in the 'Death Hole,' and spend the rest of the day shooting wallabies in the scrub, returning home in the evening. He said he should like to join us, and suggested that it would give us all more time for shooting if he went and caught some schnapper whilst we got the crayfish. Now, he had never caught a schnapper in his life; but we did not know it, and so we cheerfully lent him one of our best heavy lines, strong enough to hold a porpoise, told him where to fish from, and warned him of the danger of hooking a groper, especially if sharks were about.

Lighting his huge meerschaum, off he went round the north side of Big Nobby, and we set out for the crayfish rocks, which were quite half a mile distant along the coast to the south.

It was a glorious morning. The blue Pacific was sparkling in the bright sunshine, and a gentle breeze was rustling the leaves of the trees that clothed the mountain spurs from their summits to the water's edge. The tide was low when we began operations, and in two hours we had all the crayfish we wanted—six big fellows weighing from eight pounds to twelve pounds each. Then we went back to the camp, had another drink of tea, and waited

for Zaabe. An hour passed, and then my eldest brother began to feel slightly anxious.

'We had better go and see how he is getting on. He is such a great, clumsy bullock, and is wearing hobnailed boots—just the thing he should not wear when fishing off smooth, slippery rocks. Anyway, he must have caught quite enough schnapper by now, unless he is a rank duffer.'

The 'Death Hole' could be reached in less than ten minutes from the camp, and we were soon clambering over the rocks on the north side of Big Nobby. Although there the sea was fairly smooth, the cave was making its usual rumbling as the swelling seas rolled in between the walls of rock. Suddenly we heard a cry—unmistakably the call of a person in distress. In a few seconds we were round the side. Zaabe was not in sight!

But again we heard a cry: 'For God's sake come here and save me!'

Rushing to the edge of the wall, we looked over into the Hole, and there, on the opposite side, halfway up the rocks, was Zaabe, his feet planted on a small, square surface of rock which stood about a foot out of the water, and his body bent almost double. His face, chest, and hands were streaming with blood from a terrible wound on the right side of his face, which from the eye down to the jaw was cut through to the bone. But what filled us with horror was the presence of three huge 'gray nurse' sharks which were swimming to and fro in the clear water of the Hole, passing every now and then so close to the wretched Zaabe that he could quite easily have touched them with his foot. Wiping the blood from his mouth, the agonised man huskily begged us to save him, and pointed with a shaking hand to the terrors at his feet.

Shouting to him to keep quiet, we hurriedly consulted as to what was to be done. To drive the sharks away with stones was impossible; there was not a loose stone anywhere near, and every moment Zaabe's piteous appeals for help served to distract us. We knew that if he fell in he would be devoured instantly, for the sharks could not only see him but were literally tasting the stream of blood that ran down the rocks and tinged the water at their base.

All this we saw in a few seconds, or at most a minute, and then a happy inspiration came to my eldest brother.

'Run to the camp and get the guns,' he cried to my brother Will and me, 'and tell the men to bring a rope. For God's sake, make haste!' and then, as we rushed off, we heard him shouting encouragement to poor Zaabe.

Tearing over the rocks, falling and cutting ourselves, but taking no heed of such things, we gained the camp, and panted out our news to the miners, who were now sufficiently sober to be of some help. Fortunately our three guns were loaded, and, seizing them and our shot-belts and powder-flasks, we tore pantingly back to the 'Death Hole,' followed by the four miners, one of them carrying a coil of windlass rope, and the others buckets which they filled with heavy stones as they staggered after us.

When we returned Zaabe was in the same position, but had somewhat recovered his nerve, and had managed partly to stay the flow of blood from his cheek by holding one hand against it.

The sharks were still there, and the excited miners were about to begin to pelt them with the stones, when my eldest brother implored them to wait; he feared that stoning would only cause the brutes to sheer off temporarily, and Zaabe would be no better situated. Zaabe himself was not forty feet away from us; the sharks, as they passed to and fro beneath us, were still nearer—so near, in fact, that we could have struck them with a sixteen-foot oar.

Our guns were muzzle-loaders, and were charged with heavy shot No. 1, for wallaby-shooting.

Waiting till one of the brutes came within ten feet of us, we all fired together—we all knew how to shoot fish—and one charge at least struck it, for the 'gray nurse' gave a mighty splash, turned completely over, and then made a bee-line seaward, followed by the other two. A few seconds later there was a tremendous commotion in the water about a hundred yards distant—the wounded shark was being 'wolfed' and devoured by its mates.

No time was to be lost. Zaabe could not swim, and none of us had courage enough to go to him with the rope, and every time we cast it he failed to catch it. But at last he succeeded, passed the loop over his shoulders and under his arms, and let himself fall. In less than two minutes we had dragged him across and up over the rocks. He was a heavy man, and it took our united efforts to haul him up with such a slippery and dangerous foothold. Almost as soon as we had him in safety he fainted, and I nearly followed suit.

When he had recovered we all returned to the camp, and I showed the miners where I had planted their bottles of rum. Zaabe, who was glad of a large dose, told us that he had slipped over into the Hole in trying to haul up 'a fish as big as a cow' (a groper), and that he got tangled with the line, and was dashed against a rock, his face being cut open and his thumb dislocated. He managed to climb up to where we found him, and then for the first time noticed the 'gray nurses.'

THE MONTH: SCIENCE AND ARTS.

THE EVILS OF CHEMICAL PRESERVATIVES IN FOOD.

THE investigations that have been carried out by Dr H. W. Wiley concerning the actions of various food-preservatives have recently been supplemented by another voluminous report issued by the United States Bureau of Chemistry of the Department of Agriculture. It is a tome of some three hundred pages, and deals exclusively with the effects produced upon the human body by the preservation of food-stuffs with sulphurous acid and sulphites. The value of this investigator's researches is that they are the outcome of practical experiments upon an elaborate scale, there being a small corps of volunteers at what has been facetiously termed 'Wiley's Poison Factory,' who submit to the ordeal in the interests of science and the general welfare of the community. Formerly the most common mediums utilised for food-preserving purposes were boron compounds and salicylic acid and its salts, but these have now been almost entirely abandoned in favour of the sulphurous and sulphite substances. Consequently this latest report is very welcome, owing to the extensive resort that is made to these materials. Dr Wiley states very firmly that the sulphurous acid and sulphites exercise a distinctly harmful tendency upon the human frame, more especially as they possess no nutritious value in themselves. While refraining from advancing the decisive opinion that the materials are responsible for the propagation of disease, he strongly deprecates their utilisation for any purposes whatever where articles of food are concerned. In his experiments the subjects were supplied with the sulphurous acid in the form of gas dissolved in water, while the sulphites were administered in the form of capsules. The publication of this report comes at an opportune moment, and no doubt will strengthen the hands of those who are deputed to superintend the preparation of our comestibles in a preserved form.

NEW PROCESS FOR BLEACHING LINEN YARN.

An important invention which is of great interest to the textile industry has recently been patented by an Irish inventor. This relates to the bleaching of linen yarn in hank, a process which is already being widely adopted for both dry and wet spun yarns. In this process large quantities of one or more numbers up to twenty-two hundredweight are immersed, after boiling, in a large tank, and treated with the usual chemic sour soap and size, then washed and thoroughly dried without any handling whatever. The result of this system is that work which formerly occupied several weeks can now be accomplished in a few days, and without broken ends. The material winds easily and with better weight after bleaching, the colour throughout being uniform and free from spots. Not only is the process a rapid and safe one, involving a great economy in labour, with a greatly reduced risk of damage, but it can be carried out without any stoppage of the works owing to frost. Under these circumstances the method should be extensively adopted, the experience in the Irish mills where it is in operation having emphasised its value.

A NOVEL ELECTRICAL WIND-INDICATOR.

An ingenious device which should prove eminently useful for hotels, clubs, and similar institutions has recently been placed on the market. It is electrically operated, and the direction of the wind can be instantly detected any time of the day or night within the building. On the roof of the premises or some other convenient point is placed a weather-vane of the usual pattern mounted on a short pedestal. At the base of the pedestal sixteen electrical contacts are spaced equidistantly in a circle. The lower end of the axis, upon which the vane itself is carried, has a small contact-piece which revolves synchronously with the vane, and establishes connection with one or other of the contacts. From this pedestal extend seventeen wires—one the return-wire for completing the electrical circuit—to the wind-indicator placed in the most convenient point within the building, such as the entrance-hall or public-rooms. This indicator resembles a compass boxed at sixteen points around its periphery with small incandescent lamps, each of which corresponds to one of the contact-pieces in the weather-vane pedestal on the roof. If the wind is blowing from the north-west, for instance, the vane assumes that position, and the electrical contact in the pedestal corresponding thereto is established, lighting up the lamp indicating north-west on the compass within the premises. Directly the wind changes its direction the fact is immediately communicated to the indicator-board. The device is small, compact, strongly made, so that liability of breakdown is very remote, and is withal inexpensive. It can be operated either by means of a two-volt accumulator or primary cells giving two volts, so that the consumption of current is very low.

NEW RAILWAY SHUNTING-POLE.

The dangers attending the coupling and uncoupling of railway trucks in the marshalling and shunting yards are well known, since it is in this particular phase of work that the greatest number of injuries and fatalities among railway servants occurs. The hazardous nature of the work is especially increased at night. To overcome these dangers a new type of shunting-pole, which only weighs one pound more than that now in use, has

been devised, the feature of which is that it carries a small electric-lighting device to assist the shunter in his work, and at the same time enables him to dispense with the hand-lamp he usually carries. This light, which is of the flash-type, is carried in the extremity of the coupling-hook, the latter being recessed for the purpose. Consequently, at the moment of coupling or uncoupling the trucks, the man has the light thrown directly upon his work. At the butt-end of the pole is carried a small battery with a contact-spring to establish and break electrical circuit with the lamp at the opposite end, the shunter having only to depress this spring slightly, which is done as he grips the butt of the pole. For signalling to the driver of the engine, the lamp is also fitted with two signalling-lights, red and green respectively, having two small oval bull's-eye projectors. The battery carries sufficient energy for ten thousand electric flashes at one charge, and can be easily recharged when desired.

FIGHTING CONSUMPTION AMONG THE POOR.

Though extensive efforts are being made to combat the 'white man's scourge' among those classes of the community who are in the fortunate position to assist financially in their cure, the attempts to extend the same facilities to the poorest members of the social scale are somewhat spasmodic. Yet one of our greatest authorities, Dr Bulstrode, of the Local Government Board, has strikingly pointed out the remarkable relation between poverty and tuberculosis. Under these circumstances it is surely incumbent upon our Poor-Law authorities to undertake measures to arrest the ravages of this disease among the inmates of the establishments under their control. That this beneficial work can be carried out inexpensively and efficaciously is shown by the results of the erection by three or four unions in the country of special phthisis hospitals as an adjunct to their ordinary premises. In this way much valuable work can be accomplished, as the Kettering Union has conclusively demonstrated. Here the sanatorium was erected at an outlay of a few hundred pounds, and yet is a model of its kind. The hospital is divided into two sections, for men and women respectively, and is essentially used for the cure of the malady when in its incipient stage. The hospital has a southern aspect, and is quite open on that side, though sliding panels are provided to secure protection in inclement weather. Here the inmates live and sleep in the open air, and are able to participate in open-air work of a light nature by attending to the flower-gardens laid out in front of the hospital. The hospital, together with its staff and their accommodation, is completely isolated from the remainder of the union buildings, only the food being prepared in the latter, so that the sufferers are not brought into contact with the healthy members of the community. In view of the fact that much useful work has been accomplished in curing or relieving paupers afflicted with the malady, and the slight expenditure that such a hospital entails in regard to its maintenance, there would be a far-reaching effect if other establishments followed the example, and thus rendered the fight against consumption complete. It is of no material benefit to an afflicted tree if only the smaller affected twigs are treated while the disease is allowed to flourish unchecked in the larger and more extensive branches. And it is the same with the treatment of consumption.

TROPICAL CLOTHING.

In the course of a lecture delivered before the Royal United Service Institution in London, Colonel Maude, late R.E., in the course of his remarks pertaining to the question of health in tropical climes, pointed out the relation between actinic rays and their effect upon the great nerve-centres running down the spinal column. If these rays are excessive the disturbance of the nerve-centres reacts upon the stomach, upsetting digestion as well as provoking the dangerous malady of sunstroke. Consequently, it is obvious that if a non-actinic material were used next to the skin the effect of the actinic rays would be nullified. Colonel Maude personally tried the experiment some twenty-five years ago, and the relief thus secured was remarkable, since he was able to prosecute his duties in the hottest sun without inconvenience or experiencing any ill effects. The same phenomena have been observed by other sufferers, who by lining their wearing apparel and also their helmets with a red fabric have secured instant relief from the afflictions incidental to working in a torrid, blazing sun. Under these circumstances it is somewhat strange that our manufacturers have not seized the opportunity and produced various textiles answering these requirements. Even red shirts are not readily obtainable, and that distinct benefits accrue from their use is borne out by the experiences of friends of the writer, who, when engaged upon the shadeless plains of Nevada, in the United States, where the summer temperature is sufficient to raise iron to an unbearable heat, yet suffer no bodily pains, though they pursue their tasks for hours on end in the broiling sun. Considering the exodus from this country to the tropical climes of India and Africa steadily goes on from year to year, with a corresponding demand for clothing adapted to such regions, there should be a ready and profitable trade in non-actinic clothing such as is possible by the use of red lining.

A NEW GAS-LIGHT.

One of the latest developments arising from the struggle between gas and electric light for supremacy has been the devising of the high-pressure system for the former illuminant, which in conjunction with the incandescent mantle yields an exceedingly powerful light at a low cost. In Germany this latest improvement has been carried to a further degree. In this case the gas is compressed for the supply to the burner by means of a simple machine driven by the waste-heat of the lamp transformed

into electric energy. The result of this device is that each lamp is replete with its own compressing apparatus instead of being dependent upon some central compressing station, as is the case with the present high-pressure system. The light derived from this new invention is claimed to be very powerful, while it is said to be very economical in gas consumption, and occupies but little space. The main objection to any such system, however, would appear to be in connection with the compressing device, but this is stated to be so simple and has proved so reliable after a prolonged test that no apprehensions need be entertained regarding its reliability and working.

A UTILITARIAN TYPEWRITER.

One of the most remarkable outcomes of the demand for time-saving devices of the present day in facilitating office-work routine is the improvement of the typewriter. From a writing-machine pure and simple it has blossomed into an all-round adjunct of the counting-house. The latest of these commercial auxiliaries is almost human in its action. It writes upon a flat surface, such as a page of the ledger or cash-book, the writing mechanism travelling up and down the sheet like the hand in writing, and will work equally well upon any size of page or paper of any thickness. As a labour-saving device it is probably without parallel. One large industrial firm which has adopted the appliance has to make sixteen records of an order. Formerly this required no less than ten separate operations; now the typewriter does it in two. Similarly, a London bank uses the machine not only for posting the books but adding up the money-columns as well; while one machine will not only post up the ledger but prepare the customer's statement at one and the same time.

THE INFLUENCE OF MOTORING ON HEALTH.

What is the effect of motoring upon the human body and health generally? High-speed travelling, it is maintained, disturbs the nervous equilibrium, while other dire ill effects are popularly stated to arise from rapid movement along the highway. But scientific research proves the contrary; and that it tends to cure many disorders which otherwise defy treatment or the palliation of which is only temporary is shown by the investigations of Mons. A. Mouneyrat, who recently read an interesting paper upon the subject before one of the learned societies of France. As a result of his experiences, he finds that motoring improves the skin, acts as a powerful stimulant to the blood, is an excellent means of toning up the blood-circulating system, the nervous system, respiration—in fact, is a course that should be extensively followed by persons suffering from several common complaints, such as anæmia, sleeplessness, loss of appetite, &c. For the purposes of his investigation he embarked upon several motoring-tours, lasting on the average over eight days, and covered from sixty to one hundred and twenty-five miles per day, at an average hourly speed of twenty-five miles, in all seasons of the year. The result he found to be a decided increase in the number of red corpuscles in the blood. This augmentation was decidedly striking in character, the number of corpuscles in one anæmic case rising from four million three hundred thousand at the time of starting to five million six hundred thousand corpuscles per cubic millimetre at the end of eight days' motoring; while other results were no less striking, the average increase being approximately 26 per cent. It is noticeable, the investigator points out, that a motor-trip exercises the same effects upon the human body as a stay in the mountains at a height of from four thousand to six thousand feet above sea-level, and the effect is as striking upon normal as upon anæmic persons, though naturally in not so striking a degree. Sleep is induced both in neurotic and normal persons, the former, who invariably sleep but little, rapidly becoming normal. That the sport also acts as an appetiser is well known, and the motorist always partakes of his meals in the height of summer, when the tendency is to lose the appetite, with more enjoyment than the ordinary individual.

EXTINGUISHING FIRE WITH A POWDER.

An interesting demonstration was recently given in London with a new fire-extinguishing medium. Unlike the majority of such substances, the novelty of this invention is that the extinguisher consists of a dry powder which is merely thrown on the flames. In the trials, pieces of wood were placed in a shed measuring ten feet in length by five feet in breadth and three deep, and the whole, after being thoroughly saturated with petroleum, set alight. The resultant blaze, as might naturally be supposed, was terrific. When the structure was well alight the extinguisher was thrown upon it, and in a few seconds the fire was put out. Experiments were then made with blazing petrol, which was instantly extinguished by the powder, though the application of sand in a comparative test failed to quench the flames. The powder, though a potential fire-destroyer, is perfectly innocuous to the most delicate fabrics, since it contains no acid or other corrosive ingredients, and, moreover, being stored in a metallic tube, can be conveniently stowed away in any position.

SELF-OPENING DOORS.

Visitors to our large hotels and emporiums fully realise the disadvantages of the ordinary type of doors. For the former the revolving door is generally used, being divided into four sections, so that one on entering has practically to 'follow my leader,' while in the latter the swing-door is popularly in vogue. The inconvenience and dangers attending either variety are well known, while at the same time no little physical effort is required to operate them. With the new 'sesame' door, however, this disadvantage is completely overcome, and owing to its efficiency and utility its universal adop-

tion should be secured. In appearance it resembles the ordinary type of swing-door. As you approach, however, and tread on the mat, the door quietly and steadily opens for your admittance, closing as mysteriously immediately you have passed through. No action whatever is required to secure its opening, the whole operation being performed automatically by mechanical agency directly you place your foot on the mat. The operating gear is placed beneath the mat, and its simplicity and compactness may be gathered from the fact that the pit necessary for the accommodation of the latter is only eight inches in depth. Noise from slamming, draughts from quick closing or swinging, and danger of being struck by a door pushed open from the side opposite to that by which you enter are entirely avoided. Moreover, what is of far greater importance, the door always opens away from you, no matter whether you are passing in or out.

A REMARKABLE STEEL DISCOVERY.

Steel and iron trade circles are at present deeply interested in the new process which has been discovered by an Italian inventor for converting the worst description of iron into high-class steel economically and inexpensively. It is anticipated that the process will work as great a revolution in this industry as did the introduction of that evolved by Bessemer. 'Steelisation' it is called, and by its agency the old process of 'cementation' is dispensed with, thereby involving an enormous saving in labour, time, and cost of production. The inventor is at present in this country, and arrangements have been completed to enable him to demonstrate the possibilities of his idea in connection with the manufacture of armour-plates, which at present is a tedious and laborious undertaking, occupying several days, but which this inventor claims to accomplish in a few hours, while the armour thus produced is stated to be far and away in advance of any steel that has yet been evolved. Hitherto the process has been confined to small articles, with which striking success has been secured. Naturally, the process is a secret one.

A VALISE TROPICAL TENT.

Travellers and explorers in sparsely populated countries fully realise the necessity of reducing their personal impedimenta to the irreducible minimum in order to facilitate their progress from point to point. At the same time, a tent is an indispensable part of their equipment to afford them shelter at night, though it constitutes the most bulky and troublesome portion of their outfit in regard to transport. To overcome these deficiencies an ingenious traveller's tent has been devised, which can be packed into a valise for carriage, and yet only weighs fifteen pounds. Despite its light weight and compactness, it is highly serviceable. It is so designed that it can be unpacked and the tent erected, without any assistance, in two minutes, while it can be struck and stowed away in the same time. It offers complete protection from rain, and even the torrential downpours of the tropics fail to penetrate the material, so that the sleeper is always assured of a waterproof covering to his head. Although it may stand in two inches of water, the inmate will be warm and dry within. For use in tropical climes it is provided with a mosquito-curtain to protect the sleeper from the attacks of insect pests, while it also resists the ravages of the white ant. In malarial districts it can be set up on an ordinary camp-bedstead. No waterproof ground-sheet is necessary, nor a portable bedstead, pillow, or bag, for it is quite self-contained; and during the heat of the day it can be made to afford protection from the sun by setting up one side to throw a little shade. It is an excellent all-round kit for tropical work, substantially made, of great durability, and can be converted to a variety of purposes; while, owing to the small space into which it can be packed, no difficulty is experienced in regard to portability.

THE UTILISATION OF PEAT.

The claims of peat as a fuel have received considerable support from the results of experiments carried out by two firms of gas-engine and producer makers. These investigators have proved, independently of each other, that peat will produce, firstly, a gas which is in every way suitable for use in gas-engines; secondly, a considerable amount of sulphate of ammonia worth about twelve pounds a ton; thirdly, a very good coke which may be used for all kinds of heating purposes.

THE YELLOW SAND.

The peat-bogs full of asphodel, or clay where coltsfoot grows;
The chalky downs, whose traveller's-joy binds fast the guelder rose;
Gray limestone, spreading multitudes of flowers o'er the land—
I love them all, but better still the glowing yellow sand.

The lizard and the adder lie and bask through sunny hours,
The yellow broom, the yellow gorse, the yellow hawkweed flowers,
The chinking chestnut stonechat, and the myriad insect-band—
They live their lives and love their lives upon those hills of sand.

The wide and sandy common, the deep and sandy lane,
Rich blends of buff and orange, with red and brown again;
That warm, deep glow of colour, where bracken croziers curl,
And the ragworts of the autumn their yellow flags unfurl.

I lay and dreamt of magic, then woke and gazed around,
And gold seemed spread on every side, upon a golden ground;
And what I thought were fairy hosts once more upon the land
Was the dancing of the shadow-world upon the yellow sand.

ÆNEAS OF THE FORTY-FIVE.

By the COUNTESS OF CROMARTIE.

CHAPTER I.

CULLODEN was lost! Who knew it if not I, who had seen most of my clan blown to pieces by the English guns as we tried to break the enemy's line by sheer brute courage? I wondered in a vague sort of way why I had not been killed, with many a better man, instead of sitting here in a wet ditch, with the head of Coll, my foster-brother, on my knee. Coll had lagged behind the retreat, being wounded, so it was my business to stay behind too; for, even if he had not been what he was to me, he was one of my men. I had dragged him with me as far as I could, and now we had taken refuge in the last resource of the hunted beast—a ditch.

The strange part of it was, I did not feel either the sorrow or the shame of defeat. I was too stunned. Coll and I had hunted and fought, played and worked, together since we were boys, and now Coll was dying, and I could not even feel sorry. The principal sensation I had was the knowledge that everything we had held dear, everything in the world, had been wiped out as with a sponge, and that I, Æneas MacColla, had been wiped out of existence too, only leaving some one who sat in a cold and very damp ditch trying mechanically to pull his plaid round another figure that once long ago had been dear to him.

Far-away dreams were in my mind: my father's deathbed, the fierce old chief lying back in his great bed with blue curtains. He had waved away his weeping clansmen, and pulled me to him by the wrist. We had loved each other in our fierce, silent way; but we MacCollas of Inch Bala had little time for softness in our lives. My father had said that our remote island, and our castle perched like an eagle's nest on the side of a ravine, had left us a thousand years behind the new ways that were growing in the world beyond us. And he had scorned any clan but his own. 'Always remember,' he growled at me as he lay dying—'always remember that *our* ships came to this land, and we held our heads high and rode our own horses when the Saxons, whom we are now trying to imitate, were naked barbarians.' I had nodded and stroked his hand, a lump in my throat, and he went on wandering to the old tale that the clan hears from its infancy: how Æneas the Milesian got the land from the King of Erin for bravery in war. My father traced his descent so, son from son.

My mother had died when I was born. Twice he had mentioned her to me—once when I was a youth and had praised some girl to him, and once again on his deathbed. 'You've got her mouth,' he said to me; then, using the familiar *thou* in Gaelic, 'her mouth and her smile; may'st thou know such good love, Æneas dear!' Then he had turned, a smile on that fine dark face of his—such a smile I had never seen there before—as he stretched out his arms towards where the storm outside was battering the window. 'My little one!' he said, and that was all, for he fell back dead. And so I was chief in his stead, and naturally lived a life as near to his as I could—a wild life, a happy life, a life that would never come again—never again. Hares and foxes would breed, and eagle and raven would flap over the ruins of the old castle, and the last descendant of Æneas the Milesian sat shivering in a ditch.

I tried to lift Coll's head to an easier position against my knee. He did not seem able to breathe easily, and a thin trickle of red showed at one corner of his mouth. I thought of Coll's wife, a pretty little woman, and his mother, white-haired and brave, both waiting in the little thatched house by the sea. Well, many mothers would be waiting in Innis Bala. The thought stirred that stunned numbness of my heart into pain.

'Coll!' I said; then, 'Brother, speak to me.'

His eyes opened wearily. He looked very young and very tired. I was the same age as he was to a

 [*All Rights Reserved.*]

day, but I am sure I looked old. I felt as if I had sat in that ditch for years upon years.

His voice came in a husky little whisper: 'MacColla!' Then he choked and stopped, but his eyes spoke to me piteously. They said quite clearly, 'No more shall we hunt on our hills, thou and I, for the old days have departed.' He clasped my hand feebly. I bent my head and kissed his forehead. Even as I did it he shivered, stretched, and lay still, and I—I sat dry-eyed.

In past days, had Coll died in my arms like that, I believe I could have howled like a dog; but now I could not feel. Everything was dead—why not Coll? Again I thought of Coll's wife at home. Mixed with the thought of her came the thought of wild little Eelin, daughter of Fergus MacFergus, Lord of Rathmor, with whom my father had had a quarrel that led to a feud between our two clans; but now proud old Lord Fergus lay stiff on Culloden Moor.

My first meeting with Eelin had been in this wise. I had been hunting near Rathmor's country, when I saw a flutter of red among the rocks on the top of a great corrie; so I sank down and crawled, hidden by the heather. The flutter of red was a girl's dress—a short homespun kirtle. Above the red skirt she wore a deerskin doublet like a boy's. She lay flat on the heather, taking shots at a rock with a long silver-barrelled Spanish gun. The brown curls of her hair had blown loose from the snood that fastened them. She was evidently shooting badly, for, with a gesture of vexation, she suddenly tore the snood off her head and rose. The curling dark-brown hair fell in a great cloud down to her waist and over the sweetest face I had ever seen. She reminded me of tales of the Sidhe-folk the first moment I set eyes on her. I arose and faced her. The next instant the gun was levelled square at my chest. I looked down at her; her head came about to where the skean hung at my belt.

Then she spoke. 'You are Æneas MacColla?'

'I am; but I thought it was truce between us,' I said. 'If not, I am sorry.'

She lowered the gun, and looked me up and down apprehensively. Then we both laughed.

It was thus Eelin's shooting-lessons began. It all came back to me now—that odd, stolen friendship of ours. She was as unlike the usual run of women as wine is unlike water; she was as innocent and as brave as the wild, free life we both led could make her. Likewise, she was wise in all sorts of knowledge that is leaving the world now. She could read the twisted, crabbed Greek and Latin of the old books that lay scattered about my own home and about Rathmor as easily as I could myself. She knew every tradition and old belief—God knows how old—about her folk and mine. Often, as I searched for her among the scattered rocks, I have heard her singing, in that sweet little piping voice like a lark, some strange song, with the splashing pull of oars in it—such a song as the rowers of Æneas the Milesian might have sung when they crossed the seas.

It had all begun with those lessons in marksmanship. At the beginning I thought of her as a man would think of a pretty child or a little boy in whom one took an affectionate interest. Then our clans were on the verge of fight again.

'I can't come any more, MacColla,' she said one day.

'No,' I answered, 'I suppose not;' and my voice was hoarse.

Suddenly I knew I could make it open battle. She was there at my mercy. I could take her to my home, and then old Fergus would storm and my father would laugh. But then something stopped me, and we went on shooting at a piece of upstanding rock far below us.

'Look,' I said grimly when she had made a very bad shot; 'pretend that rock is Æneas MacColla riding past down there; you could shoot me easily so far.'

Her chin quivered like a child's when it is going to cry.

I flung myself down beside her and took the gun. Then I spoke again: 'Why are your hands trembling so, little one? Are you cold?'

'I am shooting badly to-day,' she said piteously.

'Listen to me,' I said. 'What shall I do without thee? I want thee more than the world wants the sun!' It sounds strange in English; but that is what I said.

When I recovered my wits we talked. I spoke of the coming skirmish with her people; and then, 'Come!' I said; 'come!'

'I should like to,' she said wistfully; 'but—my father'——

'Very well,' I said; 'you settle your father, dear, and I will speak to mine.'

. . . . . .

It was pitch-dark when I got home that night.

'I can't make peace, Æneas. I am sorry,' said my father. 'I won't make peace; and be pleased to keep your son off my land,' said Fergus. And so it was either a wedding by capture or no wedding at all.

Then my father had died. Of course we met again more than once, and I had meant to take her with me next time, when down upon us came Culloden, and blood-feuds had to be swallowed. At least ours were; others were not, more's the pity.

And now it was all over I must go home. So I arose and went. In a vague sort of dream I had covered Coll's body as well as I could with earth and dead, wet bracken—poor Coll!—yet my eyes were dry, and my heart like lead in my breast.

CHAPTER II.

MY going home was so like the going home of many others that I will not describe the long journey. It was the journey of a hunted wolf, hiding by day and travelling by night. I got home, to see our old castle on the rock still smouldering; and among the far hills what

was left of my clan awaited me. My heart was sick when I crossed the threshold of Coll's house. I felt the trembling arms of my old foster-mother round my neck; her voice came with the fierce bravery that our women could show then.

'My boy fought well, chief?' she asked.

'Well!' said I. 'Oh mother, if it had only been me instead!'

But she shook her head, stroking my cheek. The poor little wife rocked herself to and fro, weeping softly. What could a man say to her? I did what I could. But she only said, 'Men *will* fight; but why has my man gone?'

They gave me food and drink, and I departed, though the old woman begged me to stay. But I would not. Through that icy numbness that held me I could see little Eelin—her father dead, her kinsmen dead or scattered. She would be all alone. From the scared host of a roadside inn I borrowed a horse and rode to Rathmor.

Rathmor was not burned—not yet. I beat with the butt of my pistol on the barred door. It was opened furtively by an old woman. She cursed me, for the clansfolk of Fergus hated us MacCollas. But I entered with never a word. It was growing dark. The hall looked unspeakably dreary. I thought I could see the ghost of old Fergus glaring at me out of the darkness.

Then *she* came quietly, like a little shadow. I had often thought of my coming to this place with armed men at my back—not like this. Never a word we spoke; but I took her into my arms and dropped into one of the chairs by the hearth, where a fire smouldered fitfully.

Then she spoke, with a sob. 'Æneas! poor Æneas! I am sorry—so sorry.'

Not a word for her own trouble, only sorrow for mine. That hand of ice round my heart seemed to snap. I hid my face against the little figure I held, and wept—wept for the horrible, bitter shame and defeat of it all. And she stroked my hair with tender hands, murmuring soft, sweet words of pity and comfort.

'Thy dear black curls are all tangled,' she said tremulously. 'I must take care of thee, Æneas. I will get old Sheen to make the guest-chamber ready for thee, and we will eat together, and'—— The brave, sweet voice broke and stopped.

I pulled myself together and looked up. 'I am not fit to touch thee, darling, and I have made thy pretty dress all wet,' I said, thinking of my own disreputable appearance.

. . . . . .

With a very ill grace old Sheen got me a bath and clean raiment. Almost I shrank from putting it on. It had belonged to old Lord Fergus. 'Perhaps he would not mind—now,' I thought as I made my way down the winding stairway into the hall, where a hundred men could feed.

To-night there were only Eelin and myself. She had put on a white dress, tied with a black ribbon about the slender waist; another black ribbon tied back the curly hair. I knew that the black was for her dead father, her ruined clan. The white dress was for me. Against the shadows in the old hall her little face shone as white as her dress, and there were dark shadows under her eyes. But her eyes!

We had each other; that was enough, even amid sorrow, we both knew. It was a strange meal. Old Sheen served us, and—Holy Saints! how the old woman hated me! She could have plunged a knife in my back if it had not been for Eelin's presence. We took little notice of her. As I spoke of that black day of Culloden, Eelin clung to me and hid her face against my breast. I heard a hissed curse behind us, very low, but deep. And the poor child shivered. I think she had been afraid of Sheen when they were left alone in the house.

I turned and spoke sternly. 'Is not the feud over between us *now?* Her clan and mine marched shoulder to shoulder, so why hate me still?'

The old woman answered simply, 'Your father killed my man, Æneas MacColla. Is that no reason for hate? Sooner would I see the child here dead than in your arms. Nothing but a curse can come of it.'

'Then the curse I will take, if it is his,' said Eelin very quietly. 'Go thou to bed, Sheen, and let us be.'

She nodded grimly and went.

. . . . . .

I suppose it was about midnight when one of my men stumbled into the hall, gasping, 'The soldiers! Come, MacColla, to the hills!'

'Yes, go,' said Eelin, and tried to push me to the door.

'Is it likely I go and leave you alone here?' I said. I looked at old Sheen, who had entered. For very little she would give me up—I knew that.

Then she spoke. 'There's the hiding-place, MacColla; it will hold three men. I will wait here, for I shall come to no harm. I am old.' She showed me the glint of a knife under the plaid she had thrown about her. She looked down at Eelin with a sneer. 'When I was young as my lady here I killed a MacColla like a dog with this very knife,' she said.

'Oh woman!' said little Eelin, 'even so shalt thou die if he comes to harm through thee.' Then she clung to Sheen's arm suddenly. 'Sheen, for my mother's sake'——

'Hush, dear!' I said. 'I do not think Sheen will betray me.'

Sheen did not betray me for all her hate of me. She lifted the trap of the hiding-place near the stairway, and we scrambled into it—Eelin, my clansman from the hills, and I. It was pitch-dark and very cold. We heard the clatter of horses come to the door, heard the officer in charge

of the troop shout that there was a horse in the stables.

Then the search began. I heard old Sheen say, 'They are all dead,' to any questions. They tramped over our hiding-place, then obviously settled down for the night in the hall. Sheen had flung the remains of our repast into the fire. So the horse was the only witness against me, and possibly they thought his owner was dead by battle or rope by now. We heard distinctly every word spoken below us in the hall. They discussed my life and character—also my death, if I was not yet dead—with a freedom that, I felt, was not fit for Eelin to hear. I had never known before what a dangerous, vicious, and untamable barbarian I was considered. I felt Eelin shivering against me, and I suddenly realised how this bitter defeat had broken her fearless spirit, at least for a time. My clansman had resigned himself to the inevitable, and gone to sleep. He snored once, and I kicked him, so that he awoke with a start.

'Sleep quietly, or not at all,' I said, and he obeyed me. Either he kept awake or slept quietly. I could not see in the black darkness.

I sat in a corner of the hiding-place, my back against the stone wall. Being so tall was a disadvantage in there. I had taken Eelin on my knee and wrapped her close in my plaid. I told her to sleep, but she could not, being too anxious. At last came day, and they departed.

. . . . . .

The next morning we took to the hills. Sheen went to a daughter who lived in the glen below us. Eelin was once more outwardly the little wild thing that had levelled her gun at my heart on the hillside of Rathmor. She wore the same red skirt, the same boy's doublet. The rest of her belongings Conan, my clansman, carried on his back, for we were bound for the great hill-cave, three hundred feet above, where the sea had splashed the foundations of Innis Bala. Poor Coll and I had often camped there when we hunted among the hills. It was invisible save to those who knew it, for the birches grew so thick over it that in autumn its door was covered with curtains of gold and in winter with the bare hanging branches of the birch-trees and the bracken that grew waist-high.

In this hole we installed ourselves, little Eelin and I. Forty men out of my ruined clan camped in the smaller caves that flanked the big one. For the rest, it was the wildest wedding that ever chief of my race had had when Eelin put her little hands in mine, and I kissed her and called her wife under the crossed swords of two of my cousins, who had ridden, with their lives in their hands, to the wedding of the last MacColla of Innis Bala. Some days before we had seen the far-off smoke of the burning of Rathmor. We had been after game, Eelin and I, among the pathless hills, where we knew our enemies would never come. If they had, they would have to come in single file by the narrow ravine below us. I could have shot them as they came easily. From there we saw a faint line of distant smoke.

Eelin would not go. She watched, very quiet and pale, her tiny hand gripping mine. 'Æneas!' she whispered—and I put my arms about her and held her close—'*thou* wouldst not have burned it if the feud had not ended?'

And I answered, 'No, dear, no; but I would have taken thee.'

She smiled a little through the tears in her eyes.

(To be continued.)

MEMORIES OF HALF A CENTURY.

By R. C. Lehmann, M.P.

PART XIII.

MY father was the son of an artist and the brother of two who followed the vocation of their father. Of these two brothers, the eldest, Henry, was a pupil in the studio of Ingres, and spent the greater part of his life in Paris. He became a Membre de l'Institut, and was employed to design and execute the mural paintings in the Hôtel de Ville and the Palais de Justice. These beautiful monuments of his skill and labour were destroyed by the incendiaries of the Commune.

The other brother, Rudolf, also older than my father, married my mother's sister, Amelia Chambers, and eventually, after some years spent in Rome, settled in London, where he became well known as a portrait-painter. A selection from his drawings of celebrated people was published as a book, and the original collection was, after his death, bought for the nation by the British Museum. Such being the family antecedents in respect to the art of painting, it is not, perhaps, surprising that we were privileged to meet a considerable number of painters on terms of familiar friendship. Many of these I can myself remember; but it is only with regard to two of them, Landseer and Millais, that I have sufficient material for the purpose of these 'Memories.'

Sir Edwin Landseer was a frequent visitor to our house in the old days when we lived near Highgate. On one occasion—a Sunday, I think—the terrible Lord Chief-Justice Sir Alexander Cockburn and Landseer were my father's guests, and Cockburn had driven Landseer down from London in his own phaeton. The dinner began cheerfully enough; but towards its close, after the ladies had left the

room, the conversation not unnaturally—but, as it turned out, very unluckily—turned on stags and their habits. Sir Edwin happened to remark that Shakespeare had made a curious mistake about stags, for the stag much marked of the melancholy Jaques in *As You Like It* had wept:

> The big round tears
> Coursed one another down his innocent nose.

'Now, I happen to know,' continued Sir Edwin, 'that tears are impossible for stags—they can't weep;' and he was proceeding to give his reasons for this fact in natural history, when Cockburn suddenly broke in, and, fixing Sir Edwin with a rhadamanthine glare, said in a loud voice, 'Don't you think, sir, that you are committing a most unwarrantable impertinence in criticising Shakespeare?' There was no mistaking the quarrelsome intention. Everybody—and Sir Edwin more than any one else—was taken aback by the explosion, and my father hurried the party from the room into the garden, where the ladies had gathered. My father now applied himself to effect a reconciliation. It was desirable on all grounds, but chiefly perhaps because if Cockburn proved implacable it might be difficult for Sir Edwin to get back to London. We were six miles from London; there was no railway, and no flies were available. Landseer at last agreed to make friends, but Cockburn refused. No arguments prevailed against his temper. He drove away alone, and some other guest, I think, managed by dint of crowding to make a place for Landseer and to convey him home.

The following letter from Landseer to my mother evidently refers to this incident, and approximately fixes its date:

> *Thursday*, 13 *July* '65,
> St John's Wood Road, N.W.

'Dear Mrs Lehmann,—I have great pleasure in thanking you for your lovely roses. It is most amiable of you to scatter flowers in my path! I think I know why just now you left your rosy tints at my gate. I much regret being out when you called, and sincerely hope *I* may never meet that ruffian again!—Truly yours, E. Landseer.'

The Millais family and our own were very old friends. 'Do you ask me how long we have known one another?' I once heard John Millais say to my mother. 'Why, we used to rock one another's cradles!' and one of his great jovial laughs followed to emphasise the declaration. I cannot remember any man who seemed to enjoy life and fame more whole-heartedly than Millais. His magnificent, stalwart frame, with the noble head set splendidly on his broad shoulders, his resonant voice, and the rollicking, boisterous good-humour of the man, would have made him remarkable in any gathering quite apart from the genius that has given him his place amongst the great painters of the world. He seemed to breast the waves of life like a strong swimmer rejoicing in his strength.

The letters that follow are all addressed to my father. I have to thank the Millais family, and especially Mrs C. B. Stuart-Wortley (the 'Carrie' of the letters) for permission to publish them here.

> 'Erigmore, Birnam, Perthshire,
> 24*th September* 1878.

'Dear Frederick,—The Viper Hills is with us, and has sloped off to his bedroom to breathe some of his poisonous words into your ear, through the post; and as it is raining outside (no wonder, say you, in Scotland) I will also send you a line to say Heaven knows what, for the pen already falters and my brains are dry. The Commodore was here two days ago, and was reduced to a shadow with the exertions of Lawn Tennis, but is on the whole a healthy-looking Tar. He let go the painter, and is cruising south to incubate more Loans, and to increase that colossal fortune in which we all participate. Alas! all my pretty chickens are leaving us. George and Carrie go this afternoon, and only Mary and Tot will be left with us. Education, education, and when they are finished behold they know *nothing*. Talk about Foreign Loans being a swindle, how about family instruction? But my poor dear Fred, you have a regiment of Vulcan Sheffielders hammering out a fortune for you, whilst your poor dear, poorer friend can only turn out a fancy article occasionally, subject to the fickle approval of an insensible public. Why should you go to America? What is the use of telegramation but to keep friends at home? We must dine again together and have more whist. Give my love to your wife and Nina, and if you do go to the dismal swamp bring me a canvas-back duck.—Your affectionate friend.'

Here is added a pen-and-ink sketch of a knickerbockered artist painting the portrait of an all but inverted ballerina.

The next letter shows Millais clamouring (in verse) for the return of his daughter Carrie. She was staying with us at Dunnichen, Forfar:

> 'Erigmore, Birnam, Perthshire,
> 24*th September* 1881.

'My dear MacLehmann
Why this delay man?
Næthing can be plainer
You mauna marry
My sonsy Carrie
Wherefore then detain her?
I ken I oughter
With anither daughter
Rest and be satisfeed,
But somehow she
On the piano fortee
I'm wanting by my seed; *Note*—side.
I'm sure you dinna
Permit your Nina,
To gang awa for weeks
And kick her heels,
Wi' pawky Chiels
In kilts, and Southron breeks.

Look to it frind
And quickly sind
My daughter back to Birnam.
Or Mister Apilles,
Like the Machilles,
Will smite thee on the Sturrrnum.
The Mither's gane
And left me alane,
Nor fashed hersel' for the Lassie,
But if ought gaes wrang
She'll no be lang
Before she ca's me Assie.
So send me my bairnie
My bonnie ane Carrie
To gratifee my lugues (lugs)
Wi' Rubinstein and Auld Lang Syne
And Bach's immortal fugues.
Wae's me, I'm auld
And feel the cauld
Nae wonder I'm dejected
When she bides wi' ye still
Sae silent and chill
What Father would feel but neglected;
For never a word
Has the familee heard
Of what the Creetur's aboot,
And it's just on the cairds,
She's aff wi' the lairds,
To find oot the mon whae will shoot.
A bawbee at maest
Would ha' sent through the Paest
A letter to keep us frae frettin',
But thoughtless and asy
The Cutty's too lazy
To write, or is aye noo forgettin'.

'Remember me, Freddie,
To your ane gude leddie,
And forgie us this ebuleetion,
I am no that daft
But I ken my craft
And can paddle it wi' discreetion.

'If it's no in your poower
To read this, be sure
To speir her for information;
You'll find her profeecient
Wi' learnin' suffeecient
To interpret the verse of her Nation.

'And let me just say
They bodies wha hae
Sic a chance as to cross the Tweed,
Wha visit auld Reekie
And eat cock a leekie
Are fortunate persons indeed.

'Wi' sic beautiful weather
And dry bloomin' heather
We're a' of us boond to be happy,
For the burns though on spate
(Which seldom abate)
Are never mair than a "*wee drappy.*"
—Yours as before,
Foo Erigmore.'

Here follows a sketch of a waste of waters with a mountain peak projecting from it in the background, an umbrella floating handle up in the foreground, and a head—Millais's own—showing above the waves on the right. Underneath is written, 'All that is left to tell the tale.'

'DALPOWIE HOUSE, MURTHLY, PERTHSHIRE, N.B.,
29th September 1882.

'DEAR FREDERICO,—Will you, will you, come and see me (us) here? Welcome will you be. Perhaps a game of whist if you can hit it off with Sir Henry Thompson, who comes here early next month, October. I tell you fairly I am all day on the river fishing, casting, casting, sometimes *blasting* that the fish won't rise. Yet have I been successful; a 21 lb. yesterday and many other 20 lb. and one 24 lb. last week, so I can promise you salmon at all times for your *tummy*.

'It would do your wife good to have a crack with mine on the perfidy of man.

'Here comes Carrie!—With love to all, yours ever,
J. E. MILLAIS.'

'2 PALACE GATE, KENSINGTON,
1st December 1882.

'Dear Freddy, will you come and eat,
Next Sunday WEEK your dinner here,
At seven sharp, and you will meet
Some friends to both of us most dear?
One, a certain Robert Browning,
Too late, the latest Oxford Doctor,
The other always cap-and-gowning,
Ever dear, *young*, Mrs Procter.
And if your Missus is in Town,
And will come too, how glad I'll be,
To welcome here my very own
Ere she had cast an eye on thee;
Say "Yes, dear Millais, certainly."

'*P.S.*—
You owe this doggerel to fog,
Which fills my studio even now,
So as you call me lucky dog,
Don't spurn his little rhyme. "BOW-WOW."'

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire*, *How England Saved Europe*, &c.

CHAPTER XXV.—A WHIFF OF GRAPE-SHOT.

JACK LAWRENCE had risen fast in the esteem of his superiors in the Foreign Office, though his rise was due to an unusual combination of circumstances. France and England were at war, and diplomatic relations of an official sort betwixt the two nations had come to an end. But the British Foreign Office felt the want of trustworthy secret agents in Paris, and they wanted such agents all the more because changes in the forces ruling France were so swift and sudden. Some one in Paris was needed, with cool eyes, to watch the witches' dance of parties there—an agent with insight enough to detect the forces behind events and shaping them.

And this youngest clerk in the service of the Office was discovered to possess these qualities in a surprising degree. He knew Paris from its gamins to its politicians as a Cockney knows the streets within sound of Bow Bells. He had a cool head and a certain histrionic gift which enabled him to act a part charged with great risk with perfect skill and even a relish of enjoyment. And in French politics and about French politicians he had a clearness of vision that astonished wiser heads. Again and again he had been sent on a secret errand to Paris, to get into communication with some conspicuous politician or to carry a message to some member of the Royalist party, and on each occasion he had done the work committed to him with a completeness and skill which won him praise and new tasks of the same kind.

He was in Paris late in 1795 on one of these secret errands, when, as he was crossing the Place Vendôme, his eyes fell on a figure in meditative attitude in the centre of the great square, where the statue of Louis XIV. had once stood. There was something in the attitude that seemed familiar, and as Jean—to use his Paris name—came closer he recognised it. It was his old comrade of Brienne. Jean's steps grew slower as he approached, and he studied the meditating figure with keen curiosity. Bonaparte—to use the name by which he was now known—looked ill and haggard. He was very thin; the dead gold of his complexion in younger days had changed to a bilious yellow. He was visibly older than when Jean saw him last; his dress was neglected. Fortune apparently had not smiled on him.

Bonaparte turned as Jean stopped; his eyes ran with one keen flash over Jean's face and figure. But, swift as was the glance, Jean felt that it had all its old compelling power; it was keener and harder, indeed, than ever. Bonaparte's whole look suggested to Jean some fierce bird of prey whose field was the wind-blown air, but whom adverse fate had set walking with ungainly steps on the prosaic earth. The hawk-like eyes deepened that impression; and Jean was conscious that the feeling his old comrade's look always produced—the sense that he was being assessed, summed up, valued as a tool, perhaps flung aside—was as irresistible as ever.

Bonaparte had instantly recognised Jean. His eyes kindled for an instant; perhaps they even softened.

'*L'Anglais*,' he said 'in Paris!' Then his eyes narrowed with sudden suspicion. 'What are you doing here?' he asked. The penetrating eyes dwelt for a moment with their characteristic fire and swiftness on Jean's face. 'Bah!' he said, 'you are harmless.'

The pair fell into conversation, and it was at once clear that Bonaparte had no curiosity as to the good or ill fortune of his companion's affairs. He dismissed that subject as irrelevant, and went on in quick—not to say fierce—and broken sentences to talk of himself: what he had done at Toulon, at Genoa, at Corsica. Jean knew the main facts. Toulon had given him a moment's fame. He was something more than a good artillery officer; he had a genius for command. He had been sent as special agent to the Genoese Republic, had joined the army of Italy as general of artillery, &c.

But reputations in those fierce and crowded days were short-lived, and political alliances were dangerous. Bonaparte was known as the friend of the younger Robespierre; he had belonged, indeed, to the inner ring of the Jacobins. In the language of Salicetti, 'he was their man, their plan-maker.' The 9th Thermidor, which put the heads of Robespierre and his immediate circle under the knife, might well have ended the career of Bonaparte. He had been arrested, and ordered to appear before the Committee of Public Safety in Paris. If Antibes had been nearer Paris the history of Europe might have been changed by a stroke of the guillotine. Who can imagine Europe with no Napoleon, no Marengo, no Trafalgar?

Bonaparte, however, had been released and employed again. He was offered the command against the Royalists in Vendée, but some wise instinct made him refuse. Civil war such as raged in western France bred evil memories and offered few prizes. He was here in Paris, a hanger-on upon the skirts of chance, or (more ignoble still) on the coat-tails of Barras. No wonder discontent burned in the dark eyes. The early days of the Republic, it may be added, threw up many great soldiers; Moreau, Pichegru, Kléber, and others were winning fame on every frontier. But Bonaparte was fretting his fierce spirit out in Paris. France, it seemed, had no need of him and no career to offer him.

He went on to tell Jean, in bitter accents, how cruelly on the very day previous fortune had dealt with him. He had applied to the Committee of Public Safety to be sent on a mission to the East to organise the artillery of the Turkish army. The section of the committee in charge of this business had granted his request and empowered him to start for Constantinople. And on the same day the Central Committee, on the ground that he had refused to proceed to his appointment in Vendée, struck his name from the list of general officers! He was thus appointed and dismissed—his request granted and his career apparently wrecked—at one and the same moment. Fortune was mocking him.

'But,' he went on, 'Paris is the stage. The Convention will need soldiers. There are great opportunities here.'

The scheme for the new constitution had just been promulgated. The Convention was a single Chamber of seven hundred and fifty members. Under the new law there were still to be seven hundred and fifty representatives, but two hundred and fifty above a certain age were to form the Council of the Ancients; the remaining members would be the Council of Five Hundred. The larger Chamber had the power of initiative; the Council of the Ancients was to serve as a check. The two Chambers would be the brain of the nation, the Directory of Five its executive. Nothing could be more scientific and symmetrical.

Bonaparte's criticism of it, however, was fierce and scornful.

'Bah!' he said. 'It is pretty; but what France wants is a chief. A Republic of thirty million people—what an idea! How is such a thing possible? France wants, not phrases, talk, theories of government, but a chief covered with glory.'

The Convention had decreed that the new constitution should start with itself. Of its present members two-thirds were to constitute part of the new Chambers; the electors might choose the remaining third; and Paris was furious at the proposal. A fresh rising of the sections was threatened—a new and more tragical September 2.

The talk betwixt the two eddied round this point, and Jean argued that the Convention was in real danger. Its armies were distant; there were thirty thousand National Guards in Paris who would march upon it.

'The Revolution is safe,' said Bonaparte with emphasis. 'The peasants have the land, and they will stand by the system which has given it to them. All they want is a head. As for the Convention, this is not August 10. The sections have no guns; the Convention has.'

'Will you turn your guns upon the people?' asked Jean with a smile. 'You are, or were, a Jacobin. Have you turned against the Club?'

Bonaparte cast a swift, suspicious glance on him. It was like scrutiny by a spirit of fire. 'There must be an end of chaos. But what are you doing?' he asked, as though to escape a dangerous subject.

Jean told as much of his story as he deemed prudent; and while he talked Bonaparte looked at him meditatively, and evidently with some new thought in his mind.

'I have a career,' he said at last, 'and can make careers. Will you link your fortunes to mine? You are not in the least clever, my poor Jean, but perhaps for that very reason you would be useful. One could trust you.'

'You think,' was Jean's answer, with a cheerful laugh, 'that I have not wit enough to lie. It is a useful sort of dullness, you must admit, that does not know how to deceive. If I had your views as to the stupidity of not telling a convenient untruth my value to you would be destroyed. Don't you think that the quality which makes it impossible for any one to trust its possessor is hardly cleverness?'

'Ah, you are obstinate. The English blood in you makes you heavy-witted. You will never have a career.'

'I suspect the career for which a gift for lying is a necessary qualification,' said Jean with great bluntness; 'and you ought to suspect your own principles when you confess that what would make me useful to you is the fact that I don't possess them. Your theories, you imagine, are going to give you power; but it would ruin you if all the people about you shared them.'

'For once,' said Bonaparte, 'you are almost clever. Yet,' he added with emphasis, 'you are a fool, and will never rise;' and without a word of farewell he turned abruptly away.

Jean breathed more freely, for his old comrade's personality dominated him; and yet, in an inconsistent fashion, he felt sore that he could be dismissed thus as with a gesture. He felt sure that he had dropped completely out of the landscape of Bonaparte's plans.

Jean was in Paris during the stormy days that followed, and saw the fighting on the day of Vendémiaire, including the 'whiff of grape-shot' which, in spite of Carlyle, did not 'blow the thing we specifically call the Revolution into space.' As a matter of fact, it crystallised that strange human ferment into a new and enduring form.

Meanwhile the star of Bonaparte rose fast and high. He came to Paris in May 1795 with his career apparently ended. He had narrowly escaped the guillotine. In March 1796—only ten months later—Jean saw him start on his journey to take command of the army in Italy. He was not yet twenty-six.

'You are too young,' said a member of the Directory when Bonaparte was urging his claims to this particular command.

'In a year,' he replied, 'I shall be old—or dead.'

In a year, as a matter of fact, this astonishingly youthful general was able to say, 'The Committee of the Directory have no concern with my policy; I do what I please.'

Jean stood in the Rue Honore as the new Commander-in-Chief flashed past. It was a brilliant sight—the galloping horses, the thin, falcon-like face, the dark eyes under the level brows. His old comrade of Brienne was on his way to win victories greater than Cæsar ever won—and to dim fates beyond. Waterloo was only twenty years distant. And beyond Waterloo, set in the gray wastes of the Atlantic, was St Helena!

(To be continued.)

THE TRAGEDY OF THE CENCI.

By GEORGE PIGNATORRE.

PART I.

THOUGH three centuries have come and gone since the grave closed on the beautiful but hapless Beatrice and her kin, her sad fate and the awful misdeeds of her father, Count Francis Cenci, will always be remembered, as one of the darkest episodes of even her blood-stained and sinful annals, in the history of Papal Rome.

The lovely and pathetic figure of the Roman maiden, as limned by Guido Reni, moves across the pages of Shelley and many others, with the halo of her sorrows and sufferings, of her courage and constancy, as she passes on to her doom.

The Cenci family had been for centuries one of the most noble houses of Rome, and were already powerful in the tenth century, when, according to tradition, they had the questionable honour of giving a Pope to Rome; for John X., if a Cenci, was also one of the most infamous Pontiffs of an infamous epoch. Other Cencis are mentioned here and there incidentally as turbulent nobles, who were neither better nor worse than their compeers, and who have long passed into oblivion—the best fate that could await them.

The father of Francis or Francesco Cenci, that embodiment of evil, was for years the *camerlengo* or treasurer of Pope Pius V., in which capacity, according to Guerrazzi, he displayed the same zeal and acumen in clearing the crowns out of the treasury as his Holiness evinced in clearing the heretics out of the land. Certain it is that he left what was then an incredible fortune in money and estates, the rental of which was estimated at rather over than under one hundred thousand crowns, an income which very few possess even at this day in Italy. His son Francis Cenci, wealthy, noble, endowed with no ordinary mental gifts, might have been a blessing to his native city, but he preferred to become its curse. He seems to have been one of those absolute moral monsters whose nature is all evil, and whose dark souls are unlit by one single ray of pity or kindliness. Compared with him, the bandits of the Campagna and Apennines were angels of light. Cruel and fearless as a tiger, unchecked by scruples or pity, he purchased impunity through his rank and wealth. No woman was safe against his lust, no man secure against his hate. Incapable not only of affection but even of those evanescent better impulses or momentary relentings which are at times felt by the most hardened, he revelled in wickedness for its own sake. No single trait of goodness is recorded of Francis Cenci, no years of better promise; of him it could truly be said, 'Evil, be thou my good.'

Francis Cenci married twice, and his first wife bore him five sons and two daughters. Of the first, two were assassinated in Rome, and one died of disease, accelerated by neglect and ill-treatment at home. Of the remaining two, one, Giacomo or James, had wed a Roman lady, by whom he had four children. He and his wife had been driven from home by the old Count, who now withheld from his son the yearly allowance he had been forced to grant by the former Pope, and, rolling in wealth himself, heeded little his son's misery. The other, Bernard, the last of the sons, was a mere child of about twelve when the terrible events occurred which were to have their direful ending in the Square of Saint Angelo.

Beatrice and Bernard dwelt with their father in that palace of gloom which still frowns by the 'yellow Tiber.' Olympia, the elder sister of Beatrice, was the only one who escaped from the hell of which Francis Cenci was the arch-fiend. She owed her deliverance from insults, privation, and ill-usage to her own energy and intelligence. Unable to endure any longer the revolting treatment and cold-blooded cruelties of her unnatural parent, she addressed a petition to the Supreme Pontiff, so carefully worded but at the same time so powerfully written that (when she had succeeded in transmitting it to the proper quarter, notwithstanding bars and bolts) the Pope, reading between the lines, was, to his honour be it said, so touched by this affecting appeal to his protection that he delivered her at once from her father's tyranny by placing her in a convent, where she remained until she married a worthy gentleman of Gubbio. Cenci was beside himself with wrath at losing one of his victims, and proffered, 'tis said, a large reward to whoever would bring him back his daughter alive or dead; but she was under the ægis of the Pope's protection, and all his offers were vain.

Among the ill-fated inmates of the Cenci Palace, one who shared the destiny of Beatrice was her stepmother, Lucretia Petreni, whom Cenci had wed to avenge himself on her for having said that she would as soon mate with the foul fiend as with

Count Cenci. He having, thanks chiefly to his surpassing hypocrisy and other arts, succeeded in luring the poor woman into the belief that he had been slandered by evil-speakers, she was persuaded to marry the man who, apart from his reputation, was the richest patrician in Rome. As she was led to her new home by her husband he said to her, jestingly as it were, 'You would have rather mated with the foul fiend than with me? I have taken you to prove to you that you are right;' and he kept his word. He spared her no outrage, no privations; to all which Lucretia opposed a placid resignation, against which his poisonous shafts fell blunted.

But with Beatrice it was different. Modest and loving, but high-spirited and high-minded, she often shielded her younger brother, Bernard, from the brutal fury of her father, receiving the blows intended for him. She even strove to recall her father to sentiments of humanity, but all her strivings were vain; they were met by savage taunts, unspeakable blasphemies, and worse. Wearied at last of a hopeless task, sickened with the scenes of wickedness and orgies she had to witness, Beatrice bethought herself of entreating the intercession of the same high power who had rescued her sister from a life of infamy and misery. She penned and addressed in her turn a petition to Clement VIII.; but the petition never reached the Pontiff. Count Cenci, made wary by the successful attempt of his other daughter, intercepted the petition; and, fearing lest Beatrice might escape him after all, he set out accordingly in the autumn of 1596 for his fort of Rocca Petrella, taking with him his wife, Beatrice, and Bernard, and escorted by a motley company of armed followers—retainers and bravoes, peasants and foresters—for the ways were unsafe and bandits harried the whole country-side, as they had been wont to do from time immemorial. They reached Rocca Petrella safely, notwithstanding the perils of the road. Thus the grim company of swarthy ruffians, headed by the grimmer Count, the worst bandit of them all, at sundown arrived at the castle without let or hindrance.

The Count, unchecked by the thought of any possible interference, proceeded in his fell design of breaking the spirit before destroying the body of his unhappy daughter, who had become the chief object of his hatred through the uniform resistance she had from the very beginning opposed to his unspeakable conduct towards her; while all the others had bowed more or less to his iron will, either cowed, like Bernard, into submission, or passively unresisting, like Lucretia. Beatrice was immured in a narrow cell, bereft of light, bereft of fresh air, and lived in darkness and solitude only broken at rare intervals by the occasional presence of one of her father's ruffians who brought her a daily dole of bread and water, or by the dreaded visits of one whom it seems a mockery to call a father, and who came to enjoy, like the fiend that he was, the misery of his own child inflicted by himself, to taunt and revile with foul language or to insult with fouler thoughts.

Bernard, though subject to his father's brutality, fared somewhat better, not being actually incarcerated. Lucretia Petreni, whose less sensitive temper had enabled her to bear outrages and blows with less suffering than others, was the best off of all. She had to endure less from her demon husband, who, regarding her perfect indifference to his gibes and abuse, to his open violation of all decencies, even to such as by the very elastic code of Italian morality at the end of the sixteenth century were recognised as an evidence of incurable stupidity, had tired sooner of inflicting pain and contumely than she had of suffering both; thus he had left her of late comparatively unmolested. There was no pleasure in trying to torment one who seemed proof against pain.

Beatrice's sole remaining hope of deliverance from the living death she was enduring—and, faint though it was, her refuge from utter despair—now lay in the courage and love of a young Roman gentleman by name Guido Guerra, to whom she had plighted her troth at Rome. He had been forbidden the house by Count Cenci, but had contrived, through the friendly or interested assistance of one of the numerous hired cut-throats in the Count's pay, to obtain tidings of Beatrice's martyrdom at Rocca Petrella. He had vowed to himself to leave no means untried to rescue her and avenge her sufferings. He left Rome for Rocca Petrella on his errand of rescue and vengeance without any clear plan of action. He must have foreseen the possibility—nay, probability—of being compelled to slay the miscreant in self-defence, as it were, to preserve both their lives from the revenge of a man who was almost all-powerful for evil. But beyond this point conjecture cannot go. As we approach the second act of this fearsome tragedy the personages seem to loom out of semi-darkness and to move dimly round one stark and silent form. For on the ninth day of September Francis Cenci was assassinated, according to some in his sleep, according to others in his daughter's prison-cell, with the knowledge and connivance both of Lucretia and Beatrice, or without the complicity of either, by Guido Guerra, with the assistance of two hired assassins. The body was seen by some peasants on the following day hanging from the branches of a lofty elder-tree. It had been placed there by the murderers, and the sharp ends of the twigs thrust into the gaping wounds to conceal the real cause of death, if possible, by making it appear as if it had accidentally fallen from the turret of the castle. Many did believe, or at least feigned to believe, in an accident; or, as the elder-tree is also a witch-tree, some were of the mind that the wicked Count in returning from the Sabbat had uttered the name of Jesus inadvertently, and had forthwith been dashed to earth from mid-air. The body was taken down and duly buried within two oaken coffins, and alms were distributed to all who would follow the funeral, and prayers said for the rest of the soul of Francis Cenci. Nor was this intended as

a mockery, inasmuch as Lady Lucretia, who had ordered the manner of the funeral, was a devout gentlewoman of the time; and, whether she had shared or not in the guilt of the slaying, she would have shrunk from killing the soul, as one slain unassoiled and unprayed for was lost for ever, in the creed of the Lady Lucretia. And this was the end of Count Francis Cenci, whose name has been handed down to us as an incarnation of wickedness, more so than even the dread figures of the Borgias or of the Maréchal de Retz.

The version of the death of Count Cenci through mischance was accepted without demur at first, notwithstanding that there had been some suspicious circumstances which would have provoked an inquiry had the event occurred within the States of the Church; not from any greater perspicacity or wish to enforce the law and exact retribution for a crime, but rather, as we shall see, from far less worthy motives. The murder, however, had been committed within the confines of the kingdom of the Two Sicilies, then governed—and very ill-governed, too—by Spanish viceroys who had no particular or personal interest in tracking out the murderers or their abettors; and both they and the Cenci family might have escaped the fangs of the law but for their own reckless folly in remaining in Naples, where they soon squandered in gambling and drink the two thousand ducats they had received from Guido Guerra or others. Over their cups they may have let fall some words which gave a clue to the Neapolitan officers of justice; or, agreeably to one account, the assassins fell out among themselves, and one was stabbed by his confederate, who, being arrested for one murder and put to the torture, confessed to the other. However this may be, it is certain that through some indiscretion of the hired instruments of the crime or hired accomplices the facts leaked out, and coming to the cognisance of the Roman Curia, Giacomo or James, Bernard, and Beatrice Cenci, together with their stepmother, Donna Lucretia, were arrested. Guido Guerra, thanks to the timely warning of Cardinal Maffei, who sent him a pair of spurs in lieu of a verbal or written message, was able to escape disguised as a charcoal burner or vendor. Beatrice and the others were conveyed to the Corte Savella in the Via Giulia, where they were immured in the squalid, dark cells of the prisons of the still half-barbarous times. Beatrice was at first confined in one of these, but was soon transferred to a cleaner and lighter cell, where she had, in the words of Guerrazzi, 'a small loaf of wheaten bread and sunlight,' on which a human creature may live while awaiting the end by the axe of the doomsman or by privations and hardships.

For three days Beatrice was left alone; on the fourth two men entered her cell. One was the notary and the other the leech of the prisons, who had come to ascertain and certify under legal instrument whether she was physically able to endure torture. The splendid youthful strength and health of Beatrice left the physician no alternative, and the young maiden was declared duly qualified to bear the pangs of the rack and cord. Accordingly she was brought before the criminal court of Rome and charged with having caused her father to be assassinated at Rocca Petrella, in conjunction with her stepmother, Lady Lucretia, and her younger brother, Bernard, a boy of twelve, and others. The charge was indignantly denied by Beatrice.

The account of the trial left us by the able and courageous Farinacci, who defended her at some risk to himself, and in spite of covert threats from those who were thirsting not so much for the lives as for the inheritance of the Cenci, bears witness to the noble constancy of this young girl, who in consequence of her refusal to acknowledge herself guilty was subjected to the most atrocious torments, the sickening details of which have been preserved, and can be read in the chronicles of the epoch or in Dumas' *Crimes Célèbres*, and in many other works. Suffice it to say here that she endured with unshaken fortitude all the ghastly pangs inflicted by the public tormentor.

The horrors of the torture-chamber as described by many writers are too harrowing to repeat here; but it has been left on record that no device of the devilish ingenuity of the law of that barbarous age to create criminals by wringing avowals from tormented bodies was omitted. Rack, screw, cord, and splinters of wood, the vigil and so-called torture of the hair (*capillorum*), were all employed in turn, and were all employed in vain, on Beatrice; though her fellow-sufferers, her brothers and the Lady Lucretia, showed less constancy. Again and again was the hapless girl racked and wrenched until she swooned, and yet no avowal could be extorted from the pale lips. But the judges had received their instructions to find all the accused guilty at whatever cost, by whatever means, and these were not to be disregarded. A humane judge had already been removed because he had shown himself human, and had been replaced by one whose tiger-nature was fitted for the task of bringing all to the block. It was only after long and protracted tortures that a confession was drawn from Beatrice, in which she incriminated herself only, acquitting her brothers of all share in the crime, which she had alone committed in self-defence. It has never been made clear whether this avowal of guilt had been forced out by the *questionnaire*—whether, that is, nature had given way at last—or whether it had been voluntary, and made by Beatrice of her own free-will, by the advice of her counsel, the advocate Farinacci, in the hope of saving her kinsmen certainly and herself probably (as having acted in self-defence) from the block. In either case, it had been induced by outside agencies acting on a weakened frame and spirit. Nor did it avail them or her aught.

(*To be continued.*)

AFGHANISTAN: THE BUFFER STATE.

OWING to the mutual jealousy of two European nations, whose ambitions and methods of realising them are as wide as the Poles apart, there exists in the very heart of Asia a semi-independent state to which we have given the name 'Afghanistan.' Its divers peoples are bound together by no common tie save this jealousy on the part of powerful neighbours, which has herded some four million souls in a territory almost twice as large as the British Isles under a common name and a common ruler. This state, with its congeries of uncivilised, ignorant, superstitious, and fanatical inhabitants, may be regarded as the pivot on which the peace and possibly the whole future of Southern Asia depends.

The late Amir—the title which Afghanistan gives to its potentate—once likened his kingdom to a lake on which floated a swan. On one bank there lay, watching and waiting, an old tigress; on the other was assembled a pack of greedy wolves. When the swan, by which presumably he symbolised himself, approached too near to one bank, the tigress clawed out some of his feathers. When he neared the opposite bank, the wolves tried to tear him in pieces. He resolved, therefore, to keep secure from either foe in the middle of the lake, which, he thanked God, was still deep, and in His mercy would never dry up. The wolves represented the Russians, whose Central Asian khanates march with the northern frontier of Afghan territory. The old tigress was the British power in India.

For its safety as an independent state we have made ourselves responsible. But the conditions in Central Asia have completely altered from those which obtained a quarter of a century ago, and the rôle of Afghanistan has correspondingly changed. That rôle is now one which is of considerable import to the Empire as a whole, independent of party or creed; and it behoves us, therefore, to see that this state duly fulfils in the proper spirit the obligations imposed upon it.

It was in accordance with this purpose that a mission from the Indian Government was despatched from Peshawur on 17th November 1904, to discuss various outstanding questions with the Amir Habibullah Khan. That mission, after a five months' stay at Kabul, returned with an agreement which has been published *in extenso*, and which involves mutual obligations. Since then Afghanistan and its ruler have figured prominently in the political arena, and under these circumstances a brief survey of the country and its peoples may be opportune.

It may be well to explain at the outset that Afghanistan, as we know it, is not the land exclusively of Afghans, nor do Afghans inhabit only that tract of country which bears their name. The term was originally applied, like the term 'Afghan' itself, by foreigners, and applied erroneously; and it denotes the territory over which the Durani chief holds sway. In that territory the Afghans are neither the most ancient, nor the wealthiest, nor the most powerful section; but, owing to the common use of the term by Persian and Indian authorities, the Amir now styles himself King of the State of Afghanistan.

This state consists of a square, mountainous, irregular plateau, about two hundred and twenty thousand square miles in area, at an altitude varying in parts from three thousand to five thousand feet above the level of the sea. Owing to its geographical and political situation, it is known as a 'buffer state,' being sandwiched between our Indian possessions and the Asiatic dominions of the Czar. Roughly speaking, it extends four hundred and fifty miles from north to south, and six hundred miles from west to east, with a narrow arm in the north-east corner which projects some three hundred miles farther east. It is intersected by ridges of great height and valleys of varying breadth, which render the greater part of the country valueless for agricultural purposes, difficult to traverse, and almost impossible to govern satisfactorily. Its climate, as may be gauged from its physical characteristics, is variable, with extremes of heat and cold very trying to those not inured to such variations. Many of its valleys are as uninhabitable in the hot season, when the deadly simoom is prevalent, as are the mountainous districts during the winter months. For this reason the population outwith the few towns is largely nomadic, the pastoral section of it being necessarily so. To these natural disadvantages, and the enormous difficulties in the way of surmounting or circumventing them, it owes in great measure its continued existence as an independent kingdom.

Afghanistan is divided into five provinces or districts, each of which is ruled by a Governor, to whom the various tribal chiefs and *jirgahs* are responsible. These Governors are appointed by the Amir, and are removable by his sovereign will. The whole system of government is feudal, and only the iron hand of the Amirs, ruthlessly employed, has kept the heterogeneous elements composing the state in proper subjection. Internecine strife has been the chronic condition of the country from its earliest times, and the long and ceaseless struggle for mastery has frequently had far-reaching consequences both in Europe and Asia. North of the mountain belt and between it and the northern frontier is the province of Afghan Turkestan. Northeast of the Turkestan province is that of Badakshan, the ancient Bactria, long coveted by Russia and added to Afghanistan by Dost Mohammed in 1859.

The three remaining provinces are named from their principal towns—Herat, Kabul, and Kandahar, names familiar in history. Herat, on the extreme

west, has passed through many vicissitudes of fortune, and has long been designated 'the key to India.' Whether or not it merits that distinction is matter of opinion, and conflicting views have been from time to time set forth by military and political strategists. Its importance has of recent years been considerably discounted by our improved position in Baluchistan; but the possibilities attached to its possession have formed a bone of contention which has on more than one occasion involved us in a costly war with Persia, and on other occasions has brought us to the verge of a European conflagration. The fact remains that it lies at the mercy of Russia should she ever deem it advisable to move against it. The move would assuredly be a *casus belli*, as a direct menace to our interests in the Middle East, independent of our agreement with the Amir. The whole province is a fertile granary capable of supporting a considerable force, and the fortress of Herat commands the road which leads to Kandahar and Kabul, and thence to India. The Herat valley extends for two hundred miles, and is watered by the Hari Rud. The city, like other Afghan cities, is dominated by a citadel on a central eminence, and the town proper lies around the base between it and the external surrounding wall. In its present state resistance for any length of time to an army equipped with modern appliances would be futile. The inhabitants are Iranians, and quite alien to the Afghan rulers and to their Turkoman neighbours in the adjoining province on the north.

Kandahar is the southern province, and of most importance to this country. Its chief town is the largest in Afghanistan, though not the most populous, and is but seventy miles from our frontier station at Chaman, which is connected by one hundred and twenty-five miles of railway with our great fortress of Quetta. It has been occupied on more than one occasion by British troops, and at Maiwand, just beyond it, occurred one of the greatest disasters to the British arms when Burrow's Brigade was overwhelmed by the hordes of Ayub Khan, necessitating that brilliant march of General Roberts from Kabul to Kandahar. The province is generally open country, but dry and parched, except in the valleys watered by the numerous streams which go to form the Helmund river. The caravan-track to Herat passes by Girishk and Farrah, the former fort being in the rich alluvial district of Zamindawar, noted as being the most fanatical centre and the home of Ghazidom. South of the irrigated region along the Helmund valley is open desert of sand and scrub. The distance from Herat to Kandahar as the crow flies is about two hundred and eighty miles; but the only route is the *khafila* track, which leads south from Herat to Farrah along the Persian frontier, and thence to Girishk, where it crosses the Helmund, the whole route extending to over three hundred and sixty miles.

From Kandahar north to Kabul there is an excellent road, and on this line prosperous Afghanistan may be said to lie. Here is the country of the Ghilzai tribes, the *powindahs* whose trading-caravans traverse the frontier passes and spread over the Punjab. On this route is the strong fortress of Kalat-i-Ghilzai and the famous city of Ghazni, once the capital of a mighty empire and the seat of two dynasties. It is situated on a tableland of the Paghman range, a branch of the Hindu Kush, and all that remains of its former glories are the ruins of its forts and the tomb of its greatest ruler. Near Ghazni is the Sher Dahan Pass, the only formidable part of the route.

Kabul, the capital of the remaining province and of the kingdom, and the seat of its sovereign and supreme Government, is about one hundred miles north of Ghazni and in almost the same latitude as Herat. The three cities, indeed, form the points of an isosceles triangle whose base is about four hundred miles and sides two hundred and eighty miles. Kabul is built on a plain at an altitude of over seven thousand feet, and is a dirty, insanitary city, surrounded by high mountains, with the gorges of the Kabul river leading into fertile valleys beyond. It has also supplied its dark pages in our history, and has been occupied by our troops. It is approached from India by the Khyber Pass, the most famous of the defiles which connect Afghanistan with the Punjab. The province has several valleys noted for their fruits, and the available agricultural ground is extensively irrigated by canals. The whole of the Kabul basin is exceedingly fertile.

The boundary-lines of Afghanistan have undergone so many alterations and rectifications both north and south that the parable of the swan attributed to the late Amir Abdurrahman Khan is not without significance. Feathers have undoubtedly been freely abstracted; but the present boundaries as fixed by various Commissions and treaties were finally ratified by the Anglo-Russian Commission of 1885, after the Russian occupation of Merv; and during this demarcation the historical Panjdeh sensation occurred which brought us to the verge of a Russian war, but which nevertheless resulted in Russia obtaining all she had bargained for. Between the actual frontiers of India and Afghanistan from the Gumal to the Khyber are the tribal lands of the Waziris and of the Orakzais and Afridis of the Tirah, who still retain their independence.

Reference has already been made to the heterogeneous character of the inhabitants. The original Iranian stock is found in the Tajiks, who are closely allied to the Persians in language and habits, and are hence known as Parsiwans. They are found in western Afghanistan, principally in the Herat province, usually as agricultural labourers subservient to their Afghan masters.

The true Afghans, as distinguished from the 'affiliated Afghans,' as they have been termed, are those of the Durani tribes, who, calling themselves Ben-i-Israel, claim descent from the lost ten tribes who were carried into captivity by Nebuchadnezzar. In his traditions, his family nomenclature, and even

in his characteristic features, the Durani betrays a trace of Hebraic origin. They are the most numerous of Afghan tribes, and inhabit southern Afghanistan chiefly, and particularly the district of Zamindawar. The section was originally known as Abdali, the term Durani dating only from the days of Ahmed Shah. The tribe has three main divisions, and to one of them, the Barakzai, the present royal house, founded by Dost Mohammed, belongs. The Duranis are the most warlike and most fanatical of the tribes, and have always retained the supreme power by reason of their prowess, their religious enthusiasm, and their control of the best arms and ammunition. They have always been our bitterest foes.

Next to the Duranis, or true Afghans, are the Ghilzais, who are of Turkish extraction. They form, as already indicated, the trading part of the community; and while they have never given a ruler to the land they now inhabit, they have provided occupants for the throne of Persia. They are a powerful section, and without their support no Amir could long retain the throne of Kabul.

The tribes which occupy the central mountainous zone are of Mongol origin, relics of the invasion of Genghis Khan. These Hazaras, as they are termed, have always maintained an amount of independence which has been troublesome to the Afghan Amirs, as their mountain fastnesses are so difficult to penetrate. They, too, are Shiah Mohammedans, and their language is a Persian dialect. They are a sturdy, wiry race of Highlanders like the Gurkhas and Dogras of Northern India, free from the fanaticism of the Pathans, and favourable to the British power. They are excellent workmen and soldiers, and large numbers of them have enlisted in our native regiments on the Indian frontier. The Afghan corps of sappers and miners is recruited from the Hazara tribes.

Another section of the population which, until nearly decimated by the armies of the Amir a few years ago, always retained its independence is that occupying Kafiristan between the Kabul and Chitral rivers. These tribes are in reality tribal remnants of divers kinds speaking many dialects, and having absolutely nothing in common with the Afghans or Ghilzais, and little with each other. They are of Aryan stock, and have never as a people embraced the Mussulman faith. Hence their name 'Kafir,' which signifies 'infidel.'

Reference has been made to the chronic internecine strife which has ever prevailed in Afghanistan as a result of the mixed character of the population. After the Afghan war of 1878 Shere Ali fled, and died in exile. His son Yakub Khan, who succeeded, gave us the Treaty of Gandamak. The Cavagnari mission went to Kabul, and was wiped out by the fanatical Afghans, a procedure which necessitated another war, and Yakub was deported to India. But meantime Ayub Khan, marching from Herat on Kabul, attacked a British force at Maiwand, annihilated a brigade, and entered Kandahar. The result is recent history. Ayub Khan, always a popular hero, was worsted by General Roberts and deported to India, while Abdurrahman Khan, the eldest grandson of Dost Mohammed, was offered the throne. His position was by no means a bed of roses, and he had a rebellious cousin, Issak Khan, to deal with, against whom he was fortunate enough to be successful through no tactics of his own. He soon, however, proved himself a wise and strong ruler, and was given a subsidy from the Indian Exchequer. The original purpose of this grant was defined in a letter from Lord Ripon, in which, after discussing the difficulties besetting the situation, and accepting the Amir's protestations of loyalty and assurance of good faith, he continued: 'Impressed by these considerations, I have determined to offer to your Highness personally, as an aid towards meeting the present difficulties in the management of your state, a subsidy of twelve lacs of rupees a year, payable monthly, to be devoted to the payment of your troops and to the other measures required for the defence of your north-western frontier.' The reply of the Amir was in grateful and cordial terms. Ten years later an addition of six lacs was made, and it was agreed to assist the Amir with material and munitions of war. That the arrangement proved a wholly one-sided affair may be gauged from the opinion subsequently expressed by Lord Roberts, who in Afghan affairs could speak with authority: 'Abdurrahman Khan appeared to have entirely forgotten that he owed everything to us, and that but for our support and lavish aid in money and munitions of war he could neither have gained nor held the throne of Kabul. He mistook the patience and forbearance with which we bore his fits of temper for weakness, and was encouraged in an overweening and altogether unjustifiable idea of his own importance.'

The situation, therefore, during the rule of the late Amir may be summarised thus: During the twenty-one years he held the reins of power he provided a welcome halt to incessant turmoil by methods thoroughly in accord with Durani precedence. Every possible enemy was simply 'removed.' He profited by our every difficulty, received some three millions of our gold, and gave nothing in exchange. Tracts of territory which he allowed us to absorb owed him no real allegiance, were indeed but thorns in the flesh; their inhabitants could never be controlled, and proved a constant source of trouble. While with our money and moral support he consolidated his own power, built factories for arms and ammunition, made roads, and trained his army, he gave absolutely no facility for British trade with his dominions. Few Europeans were admitted within his realm; railways and telegraphs were rigorously excluded; education was at a standstill. Our frontier foes were ever accorded an asylum; our traders were subjected to prohibitive dues. At his death trade with Afghanistan was less than on his accession, with no hope of betterment, and we who clamour for the open

door in China and elsewhere were compelled by the exigencies of the political situation calmly to acquiesce.

To-day the situation is somewhat improved. Abdurrahman has been gathered to his fathers, and his eldest son, Habibullah Khan, reigns in his stead. Habibullah has broken several traditions since he ascended the Afghan throne. Despite the rule that the heir should not leave the country, his eldest son, the Sardar Inayatullah Khan, paid a lengthy visit to the Viceroy at Calcutta. This was followed by a visit from the Amir himself which cannot but be productive of ultimate good. No wholesale massacres have been found necessary to establish Habibullah's throne, and he has encouraged the return of political refugees, high personages whose lives in Afghanistan would not have been worth a day's purchase in the time of his wily father. He is imbued with a desire to further the interior trade and communications in his country, and he is willing to improve his relations with the Indian Government. So far good.

But of infinitely more importance will be the future policy of Habibullah towards Indian trade and commerce. Upon this his sovereign existence must eventually depend. Hitherto he has manifested an antipathy to such commercial development as did his forebears, but it is possible that he may be educated to see the folly of this course. Our frontiers have been strengthened on scientific lines, and our former helplessness has been minimised. It is impossible for the *status quo ante* to be indefinitely maintained, by which India pays the Amir to stifle her trade. Times have changed in great measure since the days of Shere Ali and Ayub Khan—times and also men; and the question will sooner or later come to be considered on a commercial basis whether the enormous subsidy granted to the Amir is justified by results under the new conditions which have arisen. The terms of the original subsidy to his father are very clear. Were the new Amir sufficiently enlightened to grasp the situation, he might firmly secure himself on his throne by permitting the gradual establishment of a telegraphic service throughout his kingdom, the extension of the Indian railway system from Chaman to Kandahar, and from Jamrud to Kabul, and eventually the union of these cities by a line through Ghazni. By such means he would obtain the earliest possible and most accurate information of impending troubles, and be able to mass and maintain his troops where and when occasion required; he would provide employment for a great mass of his subjects, encourage trade with the Punjab and Central India, and conduce to the wealth and welfare of his people. Otherwise, what the future may have in store for himself and his country is one of those vexing problems whose ultimate issue we cannot speculate upon without the gravest anxiety.

BIG TREES OF THE UNITED STATES.

By D. A. WILLEY.

THE big trees of the United States are not all in the groves of California by any means, although many people have the idea that the sequoias are the giants of the forest world. It is true that they are the largest in circumference; but many of the red firs around Puget Sound, in the state of Washington, grow to as great a height, for specimens have been felled which measured three hundred and twenty-five feet from the point where they were cut to the topmost branch. They were really eight or ten feet longer, as they were measured only along the fallen trunk. Such is the size of the red fir in some parts of the state of Washington that timbers for bridges a hundred and fifty feet in length have been sawn from a single trunk, while ship-spars more than a hundred feet long are often taken from them. They are far more graceful and symmetrical than the sequoia, their admirers say, because they taper upward more gradually.

The sequoia, such as is seen in California, bulges out for seventy-five or one hundred feet from the ground up, which gives it a bulky and ungainly appearance compared with the fir. This bulge is so large that some of the trees have holes cut into them in the form of arches big enough to allow a two-horse team to be driven through.

When a fir is fifteen feet in diameter at the butt it makes a big tree. On some of the islands of Puget Sound, as well as in the country north of the city of Seattle, trees of this size have been found among the smaller ones. The timber-men consider the felling of a tree of this sort something to boast about, especially when the trunk is so large that seven or eight men can sit side by side in the cut made by the axes without crowding. As already stated, however, the trunk of a fallen fir does not represent its entire length, for the stump left is sometimes more than ten feet in height. This is due to a custom which the lumber-men in the Pacific North-West have of hewing at a considerable distance from the roots. This is done for three reasons: for convenience, for safety, and to avoid hitting any decayed spot which may be in the heart. Sometimes the larger trees begin to decay in the centre at a point near the roots. The bad spot, as the lumber-man calls it, may become so large that perhaps only a rim of sound wood a foot or two in thickness is left next to the bark; but the fir is so tough and vigorous that this will support the great weight above it.

When one of these big trees is being cut down, unless borings are made with augers or other tools, the axemen cannot tell whether the heart is decayed or not. If it should be, they may cut away so much of the sound portion that the tree will fall before they are ready. It may also topple over in the wrong direction and before the cutters and swampmen can get out of the way. When one of these forest monarchs comes down in the wrong place it is liable to make trouble, crushing down smaller trees which may be in the way and hurling branches in all directions by the tremendous force of the fall. It is also easier work to cut with the axe if a man has something springy to stand upon instead of the solid ground. Notches are made in the trunk and boards driven into them upon which the axemen stand while they are making the undercut. Standing six or eight feet above the ground on this frail support, two men who know how to handle their axes will soon open up a gash in the trunk in which half-a-dozen people can find seats.

As a result of this method of getting out timber the waste is enormous. Government forestry experts who have investigated the logging industry in Washington and Oregon calculate that only about 65 per cent. of the timber available for building and other purposes is actually sent to the sawmill. Much of it fit for lumber is left in the woodland, either in the stumps or the branches, which could also be cut into boards and planking. There is enough wood left in some of the larger stumps to build a small house, if it were secured; but the forests are so vast and the trees so large that the loggers leave much of the small timber or use it for skidways on which to haul the bigger logs to the railroad or timber-boom. When a settler clears his land for farming there is a saying that he sometimes burns its cost in the timber left on it by the loggers, which goes up in smoke.

It is because of these wasteful methods of cutting down the great forests, especially in Washington, that some of the settlers live in trees, so to speak. The region in the foothill country and in the valleys near Puget Sound where the trees have been cut off is called the logged-off land. The soil is fertile, so that it will produce good crops of grain and vegetables, and orchards can be planted on it; but as it is dotted with stumps, the problem of clearing it entails not a little labour as well as expense. Such land can be bought for a very small price compared with land which is entirely clear of the stumps and trees.

The people who are taking up the 'logged-off' lands are usually accustomed to getting along in a small way, and do not mind living in rather crowded quarters, so quite frequently one of the biggest stumps is kept for a temporary home. After the tree has been cut down, if the heart of the stump is rotten, exposure to the weather rapidly increases the decay, so that in a few years it may become merely a shell with the outside only a few inches in thickness. Then it is an easy matter to cut a hole in one end for a door and two or three small holes for windows, to clean out the inside, to cut down an adjacent cedar and split it into shingles for a roof, and the house is ready for occupation when the stove, dishes, and furniture are put in. A trunk fifteen feet in diameter will give a surprising amount of room. Some of them contain nearly a hundred and fifty square feet. If the stump is so sound that it would be too much of a task to cut away the inside of it, the settler sometimes uses one end for a wall of his house, placing logs or planks against it and making a sort of roof lean-to, which is covered with shingles or boards. Then he nails some cleats against the sides of the stump for a step-ladder, and it is used for a variety of purposes. Children may take it for a playground. It is handy for the mother to spread out her clothes to dry in the sun where she has no other backyard. It also serves for a front porch, the family sitting on it in the summer evenings.

After the farmer gets enough money to build a larger and more comfortable home the old stump is generally preserved, for it can be used as a shed, sometimes as a stable for the ponies, or as a storehouse. One of the biggest stumps in the North-West is utilised occasionally as a dancing-platform. It is more than fifteen feet in diameter, and there is room enough on the top for four couples to dance a quadrille.

The decayed wood is so rich and fertile that plants will readily grow in it, and some of the people who can find time to have a dooryard and a few flowers will leave one of the stumps, after the land has been cleared, to be turned into a flower-bed, sometimes planting vines, which run up about the base and make a very pretty effect.

The way they get rid of these ruins of the forest is by blowing them up or burning them. Holes are bored to the roots, and dynamite cartridges are inserted and exploded. If the holes have been bored in the right places and deep enough the stump is shattered to the roots, and is thrown out in such small pieces that one will make a fine supply of kindling wood.

EVENING IN OSAKA.

A SONNET.

A COLOUR-FRAGRANCE—permeating, fine—
Floats from the west, where distant mountains lie
In purple bloom, 'neath such a sunset-sky
As seems to say that *colour* is divine.
In the tea-field of patterned shade and shine
A girl bends to a well, and bends anew.
E'en now the little street's an avenue
Of softly shaded lanterns—twilight's sign.
Too often scenes more beautiful than dreams,
Saddened with so much beauty, I behold—
The limits of the heart too plainly told!
This broken beauty rests with joy my eye.
The cat'ract overleaps where slender streams
Can find a way to bless and beautify.

SIXTH SERIES.

THE NEWSTEAD ROMAN STATION.

IN travelling between London and Edinburgh on the Waverley Route, the railway approaches the valley of the Tweed at the station of Newtown St Boswells, which commands a fine view of the three peaks of the Eildon Hills on the west. Dryburgh Abbey (which holds the dust of Scott), beautifully set in woods, is about a mile to the east. Bemersyde (with its memories of the Haigs) and the Black Hill above Earlston are passed on the right, and the promontory on the Tweed at Old Melrose, with its hallowed memories of St Aidan, St Cuthbert, and St Boisil, whose name survives in the village of St Boswells. St Cuthbert was born somewhere on Leader Water in Berwickshire. Old Melrose, Jedburgh, Kelso, Melrose, all had Border religious houses. What an eye these old religious pioneers had for beauty of surroundings and fat, fertile lands! No bend of the Tweed is more beautiful than that at Old Melrose; but of its monastery and St Cuthbert's Chapel nothing remains. We have Bede's narrative of St Cuthbert, with his glowing faith evangelising the Borders, and of the monk Drithelm standing in Tweed to the middle in the coldest day of winter as a penance. Some of these things are mentioned in Mr Vernon's paper, 'The Monks of Old Melrose,' in *Chambers's Journal* for 1905.

At the village of Newstead, just before Melrose is reached, and where the skirt of the Eildon dips towards the Tweed, a great Roman station has been unveiled, some fourteen acres in extent, the largest yet explored in North Britain. It is still matter of controversy if this is the Trimontium of the Romans on Watling Street, which comes north through the Cheviots to the Forth. There was a bridge over the Tweed at this point, the foundation of which remains to be dug up. Meanwhile the spade of the excavator has turned up much of value and interest—in particular, a great many unique fragments of Roman armour, coins, tools, and military weapons. The station has been measured and mapped by Mr Thomas Ross, and will in due time be described in its *Proceedings* by the Society of Antiquaries, which has been at work here since the beginning of 1905. The work has been superintended for the society and will be described by Mr James Curle, Priorwood, Melrose, a zealous local antiquary, with Mr Alexander Mackie as master of works, who has had experience of a similar kind at Birrens, Ardoch, Lyne, Inchtuthill, Camelon, Castlecary, and Roughcastle, the other stations explored. Bremenium or High Rochester, on Watling Street, on the south side of the Cheviots, was the subject of an article in *Chambers's Journal* for 1890, 'A Roman City in the Cheviots.' Other articles on 'Roman Remains in North Britain' and 'Buried History in Roman Remains' appeared in 1903 and 1904.

There is one disappointing thing about Newstead station, that after inspection it has again been covered in. Sowing and reaping will go on above as has been done for centuries. Owing to the nature of the remains it was impossible to make a show-place of the camp. It would have gone to wreck in a few years. Besides, a large annual rental would have been incurred. The visitor must be content with the knowledge of its site, a glance at the plan, perusal of a printed description, and a sight of the remains in the National Museum of Antiquities, Edinburgh. Many stations on the great wall in Northumberland lie bare to sun and wind and the gaze of the visitor, such as Housesteads, and Chesters at Chollerford on the North Tyne, with its delightful little well-arranged museum of articles found on and near the station, and an excellent printed catalogue.

The name of one of the fields at Newstead, Red Abbey Stead, and the presence of building stone, had suggested to some writers that here was situated an ecclesiastical building intermediate to that at Old Melrose and modern Melrose. This notion has been dissipated for ever. In 1783, while ploughing, Thomas Vair, weaver, found an altar, which was passed on to the Advocates' Library; another was found in 1830—a Roman votive altar to Silvanus, the god of the woods. Before that time the cause-

 [*All Rights Reserved.*]

wayed Roman road had been struck, and a stone on which a hog was sculptured was turned up, symbol of the Twentieth Legion. In making the railway here, pits of circular form were cut through containing ashes, pottery, remains of the wild white ox, and silver and brass Roman coins. In a pit ten feet deep and three feet in diameter a human skeleton stood erect, with spear beside it. The stones of the station by some have been identified with the narrow upper strata of the Dryburgh sandstone, of a coarse red colour, inferior to the broad sandstone strata which they overlay, and out of which Melrose Abbey was built. General Roy in his *Military Antiquities of the Romans in Britain*, in following Watling Street from the Cheviots northwards, believed that here at the base of the Eildons was Trimontium, and not at Birrens in Annandale; only he places it on his map near Eildon a mile away. He is followed by Alexander Jeffrey in his *History of Roxburghshire*, who is more in favour of Newstead, and by Robert Stuart in *Caledonia Romana*. Sir George Douglas in his *History of Roxburgh and Selkirk* follows suit.

One cannot help admiring the military skill and foresight shown by Agricola in choosing the site of the station. It commanded a bridge over the Tweed, and the eye sweeps up the beautiful vale of Melrose, watered by the Tweed, and rests on the hills that guard Ettrick and Yarrow. Ralph Richardson pictures the relations that possibly existed between Romans and Celts as like those between the French and Indians during the conquest of Canada. The altars of the Celtic Druids at Dryburgh may have reeked with human sacrifices, whilst the Roman altars at Newstead were smoking with bulls and rams. He says: 'Around him are the temples of his gods. Before him are the votive altars of his race. Behind him is the triple mountain, the Trimontium, which the barbarians call the Eildean. He has a splendid view up and down the Tweed, and can mark the approach from afar of any foe. Roads from north and south pass through the camp, and he hears the steeds neighing of one of the finest cavalry regiments in Europe, for this is its headquarters.'

To-day Tweed flows a silver thread past Abbotsford, fair Melrose, and Gattonside. Thomas the Rhymer's prophecy that

> At Eildon tree, if there you be,
> A brig over Tweed you there may see

is true, for there is Leaderfoot Bridge, built by the father of Adam Black the publisher, and the viaduct (1866) of the Berwickshire Railway. Scott has given imperishable renown to the whole valley by his residence there and his romance of the *Monastery*. It is a ballad-haunted and storied land. 'I can stand,' says Scott, 'on the Eildon Hill and point out forty-three places famed in war and verse.' The view from the Eildon on a clear day is a never-to-be-forgotten pleasure. James Hogg has written *The Hunt of Eildon;* Thomas Aird, a late bard, was born at the village of Bowden, to the south. Dr George Wilson, author of *The Five Gateways of Knowledge*, was in Melrose when he wrote: 'The country is wonderful! wonderful! such a country as even Adam and Eve, when the fiery-sworded angel drove them forth, might have wandered into with delight.' The houses on the Borders, as a rule, are well and soundly built of stone. Newstead village is no exception; neither is it so in irregularity. It used to be noted for masons, and has the Fairfax Hall, a hospital, and a series of interesting old sundials. Long ago a successful experiment was made here in growing tobacco. In future it will be mentioned as the site of one of the most important Roman stations in Scotland.

In the spring of 1904, while draining operations were in progress in a field east of Newstead, called Gutterflat, the drainers cut through foundations of buildings, and disclosed pottery, bones, tiles, and black fetid matter which showed the presence of a Roman rubbish-pit. The attention of the Society of Antiquaries was drawn to this, and (as had been done in the case of other stations) excavations were begun in February 1905. A diagonal trench cut across the field revealed the north-west angle of the station and the foundations of roads; and in the fields to the east, the Well Meadow and the Red Abbey Stead, the spade of the excavator cut into the great rampart, forty-five feet in width, which surrounds the camp, faced with a stone wall eight feet thick, with three parallel lines of ditches. Within the fortifications, on the east side of the camp, are long barrack-like houses broken up into stone huts, a heavily buttressed storehouse building, the commandant's quarters, and the Prætorium with pillared courtyard. The huts are quite unique, nothing like them having been found in Scotland; they are in twelve rows, each row nearly two hundred feet long, with an open space of two feet between each hut. Neither Mr Ross nor Mr Curle knows of any British camp where the soldiers were lodged in separate huts. There were two buttressed buildings, one on each side of the Prætorium.

A great pit yielded interesting remains. The upper part was a mass of building-stones; eight feet below were human remains, beads, and a bronze brooch. At twelve feet an altar was found dedicated to Jupiter by G. Arrius Domitianus, a centurion of the Twentieth Legion, the same individual, evidently, whose altar to the god Silvanus was dug up in a neighbouring field in 1630. A corroded brass coin of Hadrian was found below the altar, and fragments of Samian ware, leather, bones of the ox, horse, sheep, pig, and reindeer. At twenty-two feet a human skull was discovered, and three hundred and fifty metal scales (part of a soldier's armour), the brass of a bright golden hue. At twenty-five feet there were fragments of earthenware jars, a bucket, shoes, knives with horn handles, and portions of a corslet of iron with bronze mountings and fragments of the plates or greaves for the protection of the arms and shoulders

Other finds in the Prætorium were spear-heads, a stylus, intaglio gems, and pottery.

Fourteen pits or wells near the railway yielded tools, weapons, armour, pottery, portions of leather garments, an iron helmet with visor attached, the headpiece embossed, with locks of curly hair and attachment for a plume, and a visor in the form of a human face. The gem of the finds is doubtless a helmet of brass richly embossed with figures in high relief, with punctured inscription on rim, 'Lucani.' Other finds included a plain iron helmet, pieces of bronze armour for the protection of the shoulders and pieces for the arms (with name Sinovenius), swords, and spear-heads. The tools included a saw with handle of deer-horn, chisels, gouges, smith's tongs, hammers, pick, mattock, two small anvils, four pioneer axes, two axes, four scythes, a bill-hook, and two staple mandrels, finger-ring, bridle-bit, stirrup, twenty-nine hub-rings of chariots, and a bronze kettle. Two chariot-wheels were found, three feet in diameter, the fellies made of a single piece of ash rimmed with iron, the hubs of elm bushed with iron. There was also an oak bucket with iron handle and mountings, and a yoke. The whole is pronounced by Mr Curle as the most important find of ancient armour made in Great Britain for many years. Most of these may now be seen in the National Museum of Antiquities, Edinburgh.

A second helmet-mask, found later, has been placed in the same Museum. There has been only one other specimen found in Great Britain, though Benndorf notes twenty as having been found on the Continent. Dr George Macdonald, in a paper in the *Scotsman* of 26th February 1908, draws attention to a passage in Arrian, a Greek historian, describing the gymnastic exercises of the Roman cavalry in which these helmets of bronze or iron were used, with yellow plumes attached. These gymnastic exercises, Dr Macdonald says, were borrowed by the Romans from the Celts of the Continent. A level expanse of ground was selected, and in this was marked out a great square, excavated to a convenient depth. Outside, at one end, was a raised platform reserved for high officers and distinguished spectators. Arrian writes: 'The riders enter the arena arrayed in helmets of bronze or iron, gilded to attract the particular attention of the onlookers wherever the wearers are specially conspicuous for rank or for skill in horsemanship. These helmets, unlike helmets for real battle, are not designed to protect merely the head and the cheeks; they are made exactly like the faces of the soldiers, with openings at the eyes wide enough to afford a view of what is going on, and yet not so wide as to involve exposure. Attached to them are yellow plumes, . . . and when the horses gallop the plumes show to great advantage.' The horsemen carried light shields gaily decorated. Although blunt javelins only were used, the foreheads of the horses were screened by frontlets. The description reads like that of a more modern tournament, with the horsemen wheeling in circles, darting in lines, now in this direction, now in that, and never drawing rein for an instant. The purpose of the face-helmet is thus sufficiently explained.

The mansion of Priorwood commands one of the finest views to be had of Melrose Abbey, and here, in the billiard-room, the finds from Newstead were displayed, rust or clay covered, before being examined by Mr Curle and sent to the Edinburgh Museum. The work of examination as we saw it was interesting and engrossing. Here is a sword-hilt with the blade rust-covered and doubled up; a short sword lies beside it, a file, and stylus. Here are antlers of deer, glass, pottery, tent-pegs, a copper jug beautifully chased, with a head suggestively Egyptian below the handle. Here are coins, including a Marcus Aurelius. Over one hundred and fifty coins have been found, not in one place, but scattered over the fort, the earliest being a denarius of Rome of the year 132 B.C., and the latest a denarius of Crispina, the wife of Commodus, 180–192 A.D.

This rectangular fort, greater in length than breadth, between two public roads to the east of Newstead, had outside three annexes, one of which contained a suite of baths. One was to the south side of the North British Railway. A road led away southwards from the camp (cut by the railway), and these annexes are defended by ditches at a distance of nearly seven hundred yards south of the camp buildings, which are entirely of stone. The squared masonry of the defences no doubt proved a handy quarry in the building of Melrose Abbey. The fort was occupied in the first century, and in all likelihood formed a stage in the advance of Agricola to the north. The latest occupation was not beyond the limits of the second century. The excavation shows that there have been four occupations. Tacitus relates how, when Agricola marched northwards, the country as far as the Romans advanced was secured by forts and garrisons. Not one of the stations fortified by his direction was taken by storm, forced to capitulate, surrendered, or abandoned to the enemy. Our written history began when the Romans touched the shores of Britannia. Gazing at the relics disclosed after seventeen centuries, we are amazed at the evidences of a civilisation so far beyond the barbarous tribes the Romans came to subdue, who may have been responsible for the ruder camp on the east Eildon. To the descendants of the conquered now belongs the greater Empire.

A PAWN IN THE GAME.

CHAPTER XXVI.—A WOMAN'S IDEALS.

THE work Jack was now doing exactly suited his temperament. It was rich in the element of adventure; it carried him out of the commonplace; it needed subtlety, resource, initiative. He would have made a bad clerk, but he was of a cool and daring spirit which found in danger a tonic; and the work he was doing was certainly dangerous. His life hung in peril every moment while he was in Paris. Detection meant instant and shameful death. The missions on which he was sent needed more than a soldier's courage, for they knew no comradeship and lacked the tumult and excitement of actual battle. But it kindled all his faculties, as wine might have kindled his senses, to feel that he was pitting his wit in a deadly and constant duel with a whole city of foes.

His work brought him more than once into contact with Pitt himself, who told the Permanent Secretary that his new agent should never be sent on errands so perilous except as a volunteer. 'The business,' he said, 'is too dangerous to be made compulsory.'

'The young fellow enjoys the work,' was the Secretary's answer. 'He looks on it as a game of chess, and is as cool over it as if Paris were only a chessboard and he a player.'

'Yes,' said Pitt; 'but his head is the stake he risks.'

Jack was in this way steadily drifting into what may be called the subterranean work of the Foreign Office. He discovered, however, that Denise at this point had a disconcerting lack of sympathy with him. She fell silent when he talked over this part of his work. Her brain was so quick, her response to every mood in his mind so sure and swift, that this silent breach of interest puzzled him. Here was some subtle discord of judgment betwixt them, but why he could not guess. Then he remembered that France and England were at war, and he could hardly expect a generous-hearted French girl like Denise to sympathise with enterprises intended to injure the France she loved so much.

One afternoon Jack intercepted Denise as she returned from giving a lesson, and persuaded her to stroll with him in the Green Park. It was late in autumn. The day had been hot, but the great trees threw long black shadows on the soft turf, and the pair found a cool and quiet seat under a roof of whispering leaves. Jean looked at his companion as they sat in the deep shade, and thought how the perfect oval of her face, the delicate brows, the deep, quick eyes, the pure cheeks in which the colour came and went so swiftly, made a picture to kindle the imagination of an artist, still more that of a lover.

'Denise,' he said presently, 'I must go to Paris again. The Office wants some new work done there, and does me the honour of thinking I am the fittest person to do it.'

Denise was watching with dreamy eyes the glory of the setting sun, the piled splendour of the clouds; but as he spoke she turned and looked at him, and he saw a sudden gleam of purpose come into her eyes.

'Jack,' she said with decision, 'I do not like it. This is not the work for you. It is unworthy of you. What the Office asks you to do is to play the spy, and the spy's work is base. You must act a part, use lies as your weapons, and only succeed by deceiving everybody.'

'Well, Denise, it is war; and I must do what a soldier would do. I must obey orders.'

'But you are not a soldier. A soldier, too, fights with honest weapons; but a spy fights with tricks. Yes,' she repeated, with emphasis, while her face flushed; 'the work is not worthy of you.'

'If I do not go they must use French agents, and they can get them readily enough.'

'Yes; amongst so many millions of Frenchmen there are base spirits who would sell their native land for a few francs. But why should you do their work?'

'I cannot refuse with honour.'

'You cannot accept with honour.'

They had drawn a little apart, and were facing each other. Jack saw the kindled face of the girl, with purpose and conviction in every line of it. It seemed to him more beautiful than ever, and yet it stung him, and his nature was stubborn.

'I should risk being called a coward,' he said with a touch of anger, 'if I refused to go.'

'It is better to be called base than to be base,' she replied with spirit.

'And do you think me base for the work of this sort I have already done?' he asked with a still deeper note of anger.

'Oh John!' she cried, illogically enough, while her sensitive lips quivered and her eyes grew suddenly wet with tears, 'how can you ask me that?'

Jack, however, sat biting his finger-nails. Here was another gulf suddenly revealed betwixt himself and the woman he thought the fairest in the world. Must he put his duty in one scale and his love in the other? If so, whichever way the scales inclined meant disaster.

'It is my duty,' he said at last; 'and duty is final.'

Denise hesitated. 'Don't you misread your duty?' she asked softly. 'If you were a soldier, and were setting out on an expedition against France—the France I love—I should think it cruel, but I could

not bid you stay. But to go to Paris to crouch, to hide, to wear a disguise, to tell lies, and to act lies—this,' she said, rising to her feet energetically—'*this* will soil your conscience.'

Jack was strangely silent that night as he sat in his aunt's drawing-room; and that lady, whose quick eyes few things escaped, noted the smileless face, the clouded brow, the long intervals of brooding silence. Presently she startled him by asking sharply what had happened. Jack stared and hesitated, while Robert Lawrence looked at him with an amused glance; for an aggrieved lover—to the dispassionate observer—always has a somewhat absurd aspect.

'He has had a talk with Denise,' he said shrewdly, 'and does not want to waste speech on less interesting people.'

'Don't tease him, Robert,' expostulated his wife, while she clicked her knitting-needles with emphasis. 'Something has gone wrong.—Tell us what it is.'

With an effort Jack shook off his mood of gloom. He was ashamed, indeed, that his trouble had been so quickly read.

'Well,' he said, 'Denise has a new quarrel with me; at least not with me, but with the work I am doing. She declares it is not honourable.' And he told the story of the talk in the park.

His hearers listened in silence. The click of his aunt's knitting-needles was more energetic than ever for a few moments after he finished.

'I think Denise is right,' said that lady at last. 'I never liked the work you have been doing. A spy! The part is mean! They should get dirty tools for this dirty work, and not your father's son.'

Jack repeated all the arguments he had used to Denise. 'A man,' he concluded, 'must serve his country in the way his country asks.' And this particular work he could do perhaps more safely than any one else.

His aunt, however, listened to his arguments with a series of impatient sniffs. 'Do not blame Denise,' she said at last more gently; 'at all events she is jealous for your honour.'

'I can guard my own honour,' Jack answered sulkily.

His uncle, meanwhile, sat puffing his cigar in silence—a silence that at last exasperated his nephew.

'What do you say, sir?' he asked.

'The work has to be done, I suppose; but, to be frank, I do not like my brother's son doing it. And Denise is wiser for you than she knows. This kind of work won't really serve your career. It can bring you no public recognition. And you do it so well that they will keep you doing it, and so you will be doing underhand work to the end of your days. You are missing the great prizes of your profession. You have done enough of this sort of work to show your quality, and you are entitled to ask to be transferred to some other branch of Foreign Office duty. If you do not take some such step you will do the work of a mole to the end of your days, and you will get the reward of a mole.'

'What is that?'

'To be buried before you are dead; to live underground; to work under conditions that soil you.'

Jack Lawrence paced his bedroom that night for long hours in a very undecided mood. He was vexed at bottom that Denise had a more sensitive regard for his honour and a clearer vision of what that honour required than he had himself. She saw the flaw in his career with quicker eyes than his own. But he began presently to analyse his own feelings. Why was he so reluctant to refuse the task offered him? Was it the dread of seeming to be a coward? But that feeling itself was only a subtle form of cowardice. Yes, he would accept Denise's reading of duty, and ask his chief to exempt him from this particular task.

He felt next day that to walk in some disguise through a Paris mob was a less trying experience than to go to the room of his chief and explain his request. That gentleman, however, listened quietly.

'You have earned the right,' he said at last, 'to say "No."'

'If you tell me it is necessary to go, sir,' replied Jack, his face flushing, 'of course I will go.'

'No; we must use our own agents on the spot, and perhaps we can make some better use of you.'

He reflected a moment. 'We want to send a Foreign Office agent,' he said, 'to Egypt. Sir Sydney Smith has tangled up things there, for a good sailor may be a bad diplomatist. You shall take the despatches we are sending to the Capitan Pasha. The transport sails at the end of this week, so you must go at short notice, and you may have to stay there some months, as sooner or later we shall be sending an expedition to the East.'

(To be continued.)

THE MYSTERY OF THE NORTH POLE.

By the Rev. D. GATH WHITLEY.

ABOUT forty years ago some American travellers were sledging in the depth of winter over the snowy wastes of northern Siberia, and one of the party portrays the awful desolation of that land of everlasting winter in the following words:

'It was a land of desolation. A great level steppe, as boundless to the weary eye as the ocean itself, stretched away in every direction to the far horizon, without a single tree or bush to relieve its white, snowy surface. Nowhere did we see any sign of animal or vegetable life, any suggestion of summer or flowers or warm sunshine, to brighten the dreary waste of storm-drifted snow. White, cold, and silent, it lay before us like a vast frozen ocean, lighted up faintly by the slender crescent of the waning moon in the east, and the weird blue streamers of the aurora, which went racing swiftly back and forth along the northern horizon. Even when the sun rose, huge and fiery, in a haze of frozen moisture at the south, it did not seem to infuse any warmth or life into the bleak, wintry landscape. It only drowned, in a dull red glare, the blue tremulous streamers of the aurora, and the white radiance of the moon and stars tinged the snow with a faint colour like a stormy sunset, and lighted up a splendid mirage in the north-west which startled us with its solemn mockery of familiar scenes. The wand of the Northern Enchanter touched the barren snowy steppe, and it suddenly became a blue tropical lake, upon whose distant shore rose the walls, domes, and slender minarets of a vast Oriental city. Masses of luxuriant foliage seemed to overhang the clear blue water, and to be reflected in its depths, while the white walls above just caught the first flush of the rising sun. Never was the illusion of summer in winter, of life in death, more palpable or more perfect. One almost instinctively glanced around to assure himself, by the sight of familiar objects, that it was not a dream; but as his eye turned again to the north-west across the dim blue lake, the vast tremulous outlines of the mirage still confronted him in their unearthly beauty, and the "cloud-capped towers and gorgeous palaces" seemed by their mysterious solemnity to rebuke the doubt which would ascribe them to a dream. The bright apparition faded, glowed, and faded again into indistinctness, and from its ruins rose two colossal pillars sculptured from rose quartz, which gradually united their capitals and formed a titanic arch like the grand portal of heaven. This, in turn, melted into an extensive fortress, with massive bastions and buttresses, flanking towers, and deep embrasures, and salient and re-entering angles, whose shadows and perspective were as natural as reality itself.'*

This grand mirage, in which trees, plants, and flowers seemed to float above the snow, is typical of the mystery of the North Pole. The present ice and snow which bury so much of the North Pole did not always exist in the Aretic regions, and only originated *recently*. Long ago there was a magnificent and a *warm* climate all around the North Pole. Then great forests with noble trees and beautiful flowers covered the whole of the Arctic regions. Then the brilliant and golden sunlight glowed with a tropical heat over those Polar regions which are now covered with snow. This is the mystery of the North Pole. Let us examine the evidences for this marvel.

We will begin by stating the well-known fact that the greatest cold at present in the Northern Hemisphere *is not at the North Pole*. The two regions where the most extreme cold now prevails in the Northern Hemisphere are in north-eastern Siberia, about two hundred miles to the north-east of the city of Yakutsk, and in the Parry Islands, which lie in the Arctic regions to the north of North America. From these two points the climate becomes *warmer*, and the temperature *rises* as we journey northwards towards the North Pole. Thus it was that Peary in the extreme north of Greenland found a region with a milder climate and a better vegetation than he had met with farther to the south. The occurrence, also, of large spaces of *open water* in the extreme north of the Arctic regions, while the southern portions are still fast frozen, is an astonishing fact. When Nordenskiold was shut up in the ice on the coast of northern Siberia in the winter of 1878–79, he could always tell by the colour of the sky far to the north that, while the vessel in which he was confined was shut up in the ice which extended as far as the eye could reach, far away to the north the sea was *open* and unfrozen all through the winter. Admiral Wrangell's experience is still more extraordinary. Again and again, in the depth of winter, he left the coast of Siberia in sledges and journeyed northwards over the frozen ocean on vast sheets of ice. The farther northwards he advanced the thinner the ice became, until at last there stretched away to the north the boundless, open, and unfrozen sea. This was in the depth of winter. The amazing spectacle is thus described by Wrangell:

'We climbed one of the loftiest ice-hills, when we obtained an extensive view towards the north, and whence we beheld the wide, immeasurable ocean spread before our gaze. It was fearful and magnificent, but to us a melancholy spectacle!

* *Tent-Life in Siberia*, by George Kennan, pp. 253-255.

Fragments of ice of enormous size floated on the surface of the agitated ocean, and were thrown by the waves with awful violence against the edge of the ice-field on the farther side of the channel before us. The collisions were so tremendous that large masses were every instant broken away, and it was evident that the portion of ice which still divided the channel from the open ocean would soon be completely destroyed. Had we attempted to ferry ourselves across upon one of the floating pieces of ice, we should not have found firm footing upon our arrival. Even on our own side fresh lanes of water were continually forming and extending in every direction in the field of ice behind us. We could go no farther.' *

This discovery was confirmed by the investigations of Anjou, Hedenström, and Tartarinoff.

It appears, then, that at the present day there exists all through the winter in the heart of the Arctic regions a vast expanse of *unfrozen sea*, the size of which is unknown. This open portion of the ocean is surrounded by a region of thick ice and intense cold; but where the open ocean extends, in the extreme north, a milder climate prevails.

Let us now go back to the state of things in the Northern Hemisphere which *immediately preceded* the present condition of the Arctic regions. This chapter in the earth's history, which in northern lands occurred immediately before the present climate prevailed, is called the Mammoth Period. At that time, during which man appeared on the earth and spread over Europe and Asia, the Northern Arctic regions had a mild climate. At the present time all the northern parts of Siberia near the shores of the Polar Sea are destitute of trees and even of bushes, while the islands in the Arctic Ocean north of Siberia are utterly desolate, and only grow mosses and a few diminutive grasses. But in the Mammoth Period great trees grew all along the coast of northern Siberia, although no vegetation grows there now. The skeletons of these ancient trees, dry, withered, and dead, may be found now standing up erect in the frozen cliffs, where there are no *living trees* until one reaches a point nearly two hundred miles to the south. Far out in the depths of the Arctic Ocean, to the north of Siberia, lie the Liakoff and the New Siberian Islands. No trees or even bushes grow on these icy wildernesses now. Nevertheless these desolate islands are full of *dead* trees, which stand upright although they are *perfectly lifeless!* These icy islands were covered with forests during the Mammoth Period. At that time so mild was the climate of northern Siberia that a vigorous vegetation of trees, grass, and bushes covered the plains where now there is *no vegetation whatever*. Then animal life swarmed in those regions which are now empty and lifeless. The mighty mammoth, the woolly rhinoceros, the strange musk-ox, the great buffalo, and the wild horse, all roamed at that time over the plains of northern Siberia. Nor was this so very long ago, for it occurred since man appeared on the earth.

In the Arctic regions, to the north of North America, the same warm climate prevailed during the Mammoth Period, and a vigorous vegetation of great forests flourished then where now neither trees nor bushes will grow. Sir Edward Belcher many years ago, in the heart of the Arctic regions north of North America, discovered traces of these ancient forests of the Mammoth Age. Whilst exploring the dreary and sterile shores of Wellington Channel (latitude seventy-five degrees thirty-two minutes north) he found the remains of a large tree which was in the exact place in which it grew. 'I at once perceived,' he says, 'that it was no spar, and not placed there by human agency; it was the trunk and root of a tree which had apparently grown there and flourished, but at what date who will venture to say? It is, indeed, one of the questions involved in the change of this climate. As the men proceeded with the removal of the frozen clay surrounding the roots, which were completely cemented as it were into the frozen mass, breaking off short, like earthenware, they gradually developed the roots as well as what appeared to be portions of leaves and other parts of the tree which had become embedded where they fell. . . . Two neighbouring mounds were also dug into, but they proved to be peat—doubtless other stumps and vegetable matter—the only remaining traces of what might at some distant period have been a forest.' † The tree was found to be a pine. During the Mammoth Period, therefore, the Arctic regions were covered with great pine-forests. How came the climate to change, and why did the forests disappear? We do not know, and we cannot even conjecture.

Geologists describe a period of ice and snow which prevailed over a large portion of the Northern Hemisphere, and which immediately preceded the Mammoth Period, and this great winter has been called the Glacial Period. It is singular, however, that this great era of ice does not seem to have prevailed in the regions around the North Pole. In the Arctic regions north of Siberia there are no traces of huge glaciers or of huger ice-sheets, and the climate which prevails now is the *coldest* that has ever existed in the Polar Sea which lies to the north of Siberia. It is the same with the Arctic regions of North America. M. Schei, who lately made most elaborate geological explorations in these Polar lands, has declared that they contain no traces of any colder climate than that which exists there at present, and that he found no indications of a Glacial Period in these Arctic regions.‡ M. Schei's geological discoveries are most valuable, and were carried on in connection with Captain Sverdrup's expedition which took place in the years

* *Siberia and the Polar Sea*, p. 333.

† *The Last of the Arctic Voyages*, vol. i. p. 380.

‡ *Geographical Journal*, July 1903, pp. 64, 65.

1898–1902. We reach this remarkable conclusion, therefore, that while the northern parts of Europe and of North America—that is, Sweden, Great Britain, and Scandinavia, as well as Canada—were covered with huge glaciers and ice-sheets during the Glacial Period, around the North Pole *at the same time* a far milder climate prevailed, and there were no ice-sheets in the Arctic regions at that era.

But we are as yet only on the threshold of mystery, and are only beginning the investigation. We will now go back to the next earliest chapter in the history of the earth, which is called the Tertiary Period. *

At that time the climate of Iceland was so warm that the vine and the tulip-tree grew in that desolate land, and the presence of these plants, the remains of which have been found in Iceland, prove incontestably that at that time this Arctic island possessed a climate fifteen or twenty degrees Fahrenheit warmer than it does to-day. The great desolate island of Spitzbergen, which now has no vegetation, and is often made the starting-point for Arctic expeditions, was covered with splendid woods of poplar, hazel, beech, plane-tree, lime, and cypress, the remains of which have all been found in great abundance in Spitzbergen. As this land is a wilderness of ice and snow for the greater part of the year, the discovery has created the greatest amazement among scientists, for that such a vigorous vegetation should have flourished in latitude seventy-eight degrees fifty-six minutes north—that is, within twelve degrees of the North Pole, where there is now scarcely any vegetation whatever—is truly astonishing. In Greenland also in those days, in latitude seventy degrees north, there grew forests of poplars, oaks, and walnuts, which imply a high summer temperature. So wonderful are the remains of the Polar vegetation that Professor Heer very correctly concludes that at that time forests of pines, alders, poplars, and willows covered the North Pole itself, if there was land there. The trunks of these great trees in Greenland can still be seen standing upright but quite dead. In the islands in the Arctic Ocean to the north of Siberia, the remains of trees which now only grow far to the south have also been found. They were not *washed* to their present position, but grew where they have been discovered. How came this warm climate to have prevailed at that time all over the North Polar regions, where now there is ice and snow, and six months of total darkness? We do not know.

We take a farther step backward into the past ages, and we read a *still earlier* chapter in the earth's history. This chapter is called by geologists the *Secondary Period*. What does it tell us about the Arctic regions? It shows us that at that far-distant time the climate of the regions all around the North Pole was not only warm but *hot*—in fact, as hot as the climate which now prevails in the tropics! This is proved by the fact that at that time enormous reefs of coral grew in the seas around the North Pole. We know that the reef-building corals are now confined to the hottest parts of the ocean, and cannot live beyond a short distance north or south of the Equator. So hot were the waters around the North Pole during the Secondary Period that not only did corals build reefs in the Arctic Seas, but a *tropical vegetation* then flourished in the Arctic regions! In Prince Patrick's Island, latitude seventy-seven degrees ten minutes north, and in other parts of the Polar regions to the north of North America, numerous remains of plants and animals and large reptiles have been found, such as only now live in *hot* countries. The magnificent cephalopod shells, the ammonites (allied to the nautilus), have been found there and in the Arctic islands in the sea to the north of Siberia. Here, then, we have the amazing fact that long ago a *hot* climate prevailed all over the North Polar regions, a climate as hot as that of the present tropical lands. How came this about? We are in utter ignorance.

We go back one step farther into the past ages, and we discover that, in an entirely new and still *older* order of things, a hot climate existed in still more remote days—that is, Palæozoic times—all over the North Pole. Enormous beds of coal have been found in many places in the Arctic regions of the north, and these belong to the true Carboniferous Period. Coal, as even the children at school know, is formed of vegetable matter, and originated from the decay of immense forests. These forests were formed of trees, bushes, and shrubs which required moisture and *heat*, and the luxuriance of the coal-forests must have been indescribable. 'In no other age,' says Hugh Miller, 'did the world ever witness such a flora. The youth of the earth was peculiarly a green and umbrageous youth, a youth of dusk and tangled forests, of huge pines and stately araucarias, of the reed-like calamite, the tall tree-fern, the sculptured sigillaria, and the hirsute lepidodendron. Wherever dry land or shallow lake or running stream appeared, from where Melville Island now spreads out its ice-wastes under the star of the Pole, to where the arid plains of Australia lie solitary beneath the bright cross of the south, a rank and luxuriant herbage cumbered every foot-breadth of the dank and steaming soil; and even to distant planets our earth must have shone through the enveloping cloud with a green and delicate ray.' †

The remains of these wonderful forests of the coal-measures have been found *all over* the Arctic regions—in northern Siberia on the Lena, in Melville Island in latitude seventy-five degrees, at the extreme northern point of Siberia, in Bear Island in latitude seventy-four degrees thirty-six minutes north, and particularly in Coal Fiord in latitude seventy-eight degrees north, in the very

* More particularly the Miocene Era of the Tertiary Period.

† *Testimony of the Rocks*, pp. 135, 136.

heart of the Arctic regions, where remains of the coal-forests were found by Captain Sverdrup in 1900–1902.

We pursue the investigation no further. We have seen that the Arctic regions never had their climate of snow and ice until *recently*. In every stage of the earth's history except the *present* the Arctic regions had a warm and even a *hot* climate. How came the climate to change? What extraordinary revolution in nature caused the present conditions of ice and snow to prevail over the regions of the North Pole? Science is dumb. We may conjecture; we do not know.

The coal-beds found by Captain Sverdrup were found in the heart of the Arctic regions, and were covered with great trunks of fossilised trees which once grew there.* These trees resembled the famous 'Big Trees' of California. In Bennett Island, which lies in the Arctic Ocean north of Siberia, and is even farther to the north than the New Siberian Islands (which contain remains of the mammoth), the American explorers found the remains of a former luxuriant vegetation.† This was in the form of a bituminous coal, which was very abundant and burnt rapidly. Still more remarkable is the discovery of true coal, formed from the decay of a grand vegetation, by Mr Hart of the English expedition in 1876. This coal was found in the extreme north of the Arctic regions, in latitude eighty-one degrees fifty minutes north and longitude sixty-four degrees west.‡ When these forests were growing the Arctic regions must have had a warm climate. Why did it pass away? We cannot tell.

ÆNEAS OF THE FORTY-FIVE.

CHAPTER III.

IT was the hottest summer we had ever known. We were almost too wildly happy to remember our sorrow, Eelin and I. News came to us now and then. The Prince had gone to France, and many with him. I was glad he was safe, the poor lad; I would fight for him again if need be. But my heart and soul were in the cave above the waves of Rathmor. My wild forty would have put their shock-heads under her little feet for love of her beauty and her sweet ways.

'*Dia*, but why didn't we carry her off when we had a castle to put her in? This is not fit for her,' said old Diarmid MacColla, who always spoke his mind to me if he thought agreeably of me or otherwise.

. . . . . .

One evening, I remember, I came home alone to our cave. From inside I heard her singing, in her sweet, soft way, an old song the women of my clan had always sung. Perhaps women had sung it before Columba crossed the Moyle. It is hard enough to translate, but thus it went:

Oh Master of Love! victorious, terrible, tender,
Hear of thy mercy the cry of the women that love maketh mothers!

Something went through my heart like a knife as I listened at the cave-door. I could see her face as she sang. It was alight with a sort of glory that made her look more unlike a mortal woman than ever. Next instant I was in the cave and had her in my arms, saying God knows what wild words of love, with wilder fear for her in my heart which I did not show.

She put up one little hand and stroked my face. All she said was, 'Oh Æneas, Æneas, I am very happy!'

'Remember,' I said, 'that I have nothing else in all the world.' I stopped, for I could not go on.

She laughed very softly. 'I think I am too happy to go,' she said simply. 'But even so, I would never leave thee, Æneas.'

I remember we sat and talked long by the cave-fire that night.

It was winter. The thought of that winter makes me shiver even as I write in the sunshine of Provence; for, like most of my kin now, I wear the uniform and subsist on the pay of Louis of France. I remember a woman touching my shoulder, and the words she spoke, with our grim fatalism that never changes: 'God pity thee, MacColla; thy son is dead!' Did I care for that? I only thought of Eelin. Dying, they said. But I swore to myself savagely that she should not die. And yet there were blue shadows about her mouth and under the closed eyes, as she lay on the couch in the inner cave. Many a modern so-called Christian would have resigned himself to a higher Power, but I would not. My father had often said that we of Innis Bala had never accepted Columba or Patrick. 'A cowherd,' the old chief would remark, referring to the latter saint. And perhaps the hot pagan blood of Æneas the Milesian and others of his kind counted even as late as now. 'Go out!' I said to the woman there. She looked at me once, crossed herself, and went. Then I knelt down and put my lips against the little ear under the soft curls.

'Eelin!' I said. There was no response. 'Eelin!' I said again insistently. There was the faintest

flutter of the little hand in mine. Then I spoke on. 'You will not leave me? Come back! come back!' Heavens, how I longed to take her in my arms! But I knew that I must not, for it would have weakened my will at once, and then I should have lost her. So I only held her hand and repeated monotonously, 'Come back! come back!' As I did it I knew that I was not in the cave; neither was Eelin. I was in a strange, gray shadow, and I was trying to find her, even as she was trying to find me.

Suddenly a far-away small voice came to me: 'Æneas, where are you? I cannot find him; what *shall* I do?'

And I answered steadily, 'I am here, close to you.'

'Æneas,' said the sad, sweet voice, 'the water is cold on my feet.'

I set my teeth and gripped the two tiny feet in my hand, as I bent over her closer. Then I knew that I was drawing her back to me, and knew more than ever that our love was no weak thing.

'Æneas,' sighed the soft voice contentedly, and somehow it sounded nearer now, 'the water has slipped back. I am so sleepy.'

From that moment I knew I had dragged her back to me by the power of love.

All night I knelt there. The power in me seemed locked, as it were, round the one desire so tightly that now it would not break. As she slept I felt the little figure grow warmer and warmer against my heart. At sunrise I knew that I could leave her safely for a while, and I thought I had better leave her, because the cave was beginning to spin about in an odd way. Every bit of strength seemed to have been drained out of me. I had not felt so exhausted even after Culloden. As I went out I staggered into the arms of old Diarmid. I hardly saw him or heard him speak as he made me sit down and forced a glass of French brandy down my throat. I suppose I was pretty near fainting, like a woman. Then I heard old Diarmid's words: 'Ah, ha! it takes a strong man to do *that*, chief. The old woman told me, and—ran; she said you were not canny, but that sure you would save *her*.' I sat up, feeling better, as he went on, chuckling: 'She said you had the Old Knowledge in the black eyes of you, and that this was no place for a Christian woman. She was no MacColla, see thou?' ended the old man, sniffing and wiping his eyes. 'Thank God!' he said.

'Yes, Diarmid, thank God!' I said.

So I did not lose my love. For long afterwards I felt fierce and watchful, as if death might part us even as she grew better. It was then we got warning that if I wished to save my neck I must go. Outside the haven lay a French ship.

It hurts to write this part. Old Diarmid and Conan we took with us. The rest of my boys went to their homes. 'While thatch can hide gun and knife, while heather grows, we'll wait for you, MacColla,' they said. It was hard work to stand it calmly. It made it worse when a piper on the shore struck up a lament. Eelin went white and trembled. But she gave her little hands to the men who swarmed about us, and tried to speak cheerfully, to put some heart into them. One of them, a young one, had dropped on his knees and wept. She patted his shock head with her thin little hand, and that made him worse. I heaved him on to his feet by the shoulders and shook him roughly. 'Pull thyself together, fool!' I said, or words to that effect, adding a nowise pretty oath. God knows I was near enough to tears myself. Then I pushed him back to make room for others who wished to say farewell.

CHAPTER IV.

SOMETIMES I wonder what I should feel or do without the love that is the sun in my sky on the darkest day. No more children have come to us, and better so. It would only remind me that the Castle of Innis Bala is a ruined mass of stone. Had life been as it was! But that will be never again. My luck here is good; for some reason or other the King took a fancy to me, more than I did to him; but I am ungrateful. I have got this dwelling in Provence among the roses and the sunshine entirely by his favour.

Sometimes we go to Paris, Eelin and I. It was in Paris I took upon myself nearly to cause the death of Monsieur le Vicomte de Longville. It began by my having extraordinarily sharp ears; it also began by my having a pretty wife. Poor, sweet little Eelin! She looked like a white flower among those powdered, painted, and patched dames of the Court. She hated powder as much as I did. My father had loathed the custom; he called it effeminate. But some of the ladies said that Eelin was lovely. Her dark curls set off the whiteness of her skin more than powder would have done. Her life in the hills had made her supple as a boy, and therefore more graceful. That and her pretty ways made not only the ladies admire her.

Thus, one night at a Court ball, I found myself standing with others some short distance behind His Majesty. He and De Longville were discussing—me. I tried hard not to listen; but soon enough I felt bound to listen, right or wrong, when I heard another name coupled with mine.

'I like him,' the King was saying half-fretfully. 'Barbarous he may be, but he is a good soldier; and, *mon dieu!* I did not know men like that came out of Scotland. He is handsome as a black Greek, and I won't have him harmed, De Longville.'

'Handsome!' I thought. 'If they had only seen my father!' But then suddenly I felt the blood drum in my ears, for De Longville spoke.

'Sire, I would not harm him, this amiable pagan of thine; but—she is ice towards me. I doubt if she would ever hear reason, and he is jealous.

Almost one wonders if at home they do not keep a harem, these *Écossais sauvages*, and shut up their women.'

I felt the taste of blood in my mouth. I had bitten my lip. Not far off I could see Eelin, and I knew, as we often knew each other's thoughts, that she was longing to speak to me.

I strode up to the King and De Longville. I spoke to the King first. 'A thousand pardons, sire, but I would ask your Majesty's leave to speak a few words to this gentleman.'

The King looked at me uneasily; from where he stood De Longville looked at me so intently that I was almost uncomfortably conscious of my height.

'Say what you wish here, monsieur,' said the King, looking out for a new sensation, as usual.

So I spoke to De Longville stiffly: 'I must ask your pardon, monsieur, for unavoidably listening to words not meant for my ears. But they referred to madame my wife, and towards such words there is only one answer from me—this!' I slashed him across the face with the back of my hand. It hurt him, and it did me good. I heard some women near us scream.

The King suddenly rose to the occasion. 'There is only one answer to that, De Longville,' he said; and De Longville bowed and went to look for a second.

I found a friend of mine, Armand de Gascon. When we had arranged matters I went back to Eelin. She was very quiet, and very pale, as we stood and talked in the antechamber of the great room where the dance still went on. Suddenly I realised that if I happened to die she would be utterly alone, and here worse than alone. The place now felt unclean and unsafe to me; and, God knows, no MacColla of Innis Bala was ever named a saint! But I realised that to us both the place was alien and artificial, therefore evil. Against it stood two souls, Eelin and myself. Presently it might be Eelin alone. In our wild past days she would have seen me go and fight unafraid, but here she did not seem able to let me go. I talked lightly, and said I would be with her in the morning, and tried to loosen the clinging little hands.

A woman with an enormously high powdered coiffure suddenly entered quietly. 'Monsieur, if you will, I will take charge of your wife till you come back. With me she will come to no harm,' she said in a low voice.

I looked at her. It was the Marquise de Pompadour, and I knew she spoke truth. So I bowed and said, 'Madame, I cannot thank you enough.'

She fixed her eyes on me—beautiful eyes they were—in a look that was a challenge I could well have done without. Then back she looked to Eelin, expecting, I could see, disdain or dislike or fear. But she got neither.

'Thank you, madame; you are very kind,' said the poor child, and she put her hand gently into La Pompadour's.

Then I saw a strange thing. I saw La Pompadour flush scarlet under her paint; then she looked at me. 'I will take care of her, be sure of that, monsieur,' she said, and her eyes said, 'If you live or die.' So I went.

CHAPTER V.
